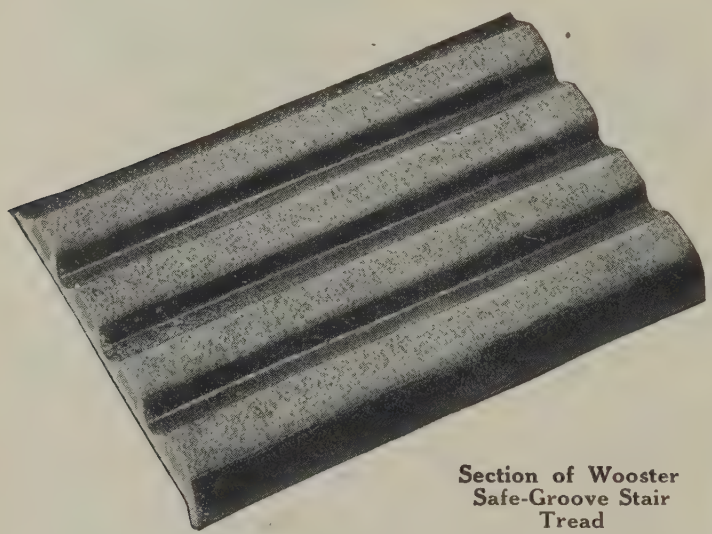
STEEL BASE, YELLOW BRASS BASE AND WHITE BRASS BASE WOOSTER SAFE-GROOVE TREADS; WOOSTER SECURITY NOSINGS AND WOOSTER SECURITY EDGING.

Wooster Safe-Groove Treads

Wooster Safe-Groove Treads are scientifically designed and proportioned in three metal bases to prevent stairs, saddles, thresholds and ramps, or any walking surface from becoming worn or dangerously smooth. They also protect stair steps from disfiguring wear under heavy traffic conditions.



Section of Wooster Safe-Groove Stair Tread

Material—Wooster Safe-Groove Treads are fabricated in black steel, highly polished yellow brass or in silvery white non-rusting and non-tarnishing white brass.

For the steel and yellow brass base treads the antislip filler may be of either carbo (abrasive grits) or lead. For the white brass sections, lead only is used.

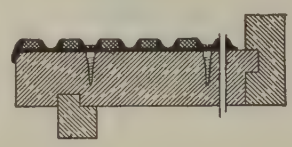
Design—Wooster Safe-Groove Treads are so designed as to present a walking surface of broad ribs of wear-resisting, abrasive material alternating with deep narrow grooves.

These antislip ribs extend clear to the bottom of the treads and the recess in which they are held is so shaped as to be wider at the bottom than at the top. This increases the area of the antislip material as the tread wears down after years of use, and increases the safety factor in proportion to the rate of wear.

Specifications—All stairs, platforms and landings to be provided with Wooster Safe-Groove (Carbo or Lead Anti-slip Filled) Treads, to be 6 in. shorter than the entire length of the steps and to be installed according to manufacturer's specifications.

Each step shall be covered according to the amount of wear to which it will be subjected. For lightly used stairs, 3, 3½ or 4-in. width with lip nosing is sufficient provided the tread is set flush into the step. Where the tread is not rabbeted or set flush, at least two-thirds of the depth of the step shall be covered. On stairs subjected to heavy traffic the treads shall be 6 to 9½ in. wide.

Methods of Application—Cross section details below show methods of applying Wooster Safe-Groove Treads to various types of stairs. Wherever the treads are to be set in new concrete they are shipped with anchors riveted on, so that after the concrete has set, the treads become an integral part of the steps.

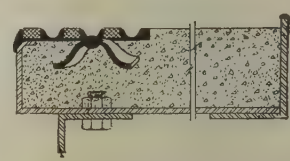


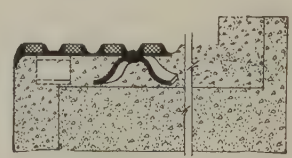
Wood, Slate, Marble, etc. Stairs

Treads shall be fastened to wood subtreads by means of No. 10 1-in. wood screws. For marble, slate or stone stairs, treads are attached with wood screws in lead shield

Pressed Steel

Treads shall be set flush with cement surface to either extend from stringer to stringer, or if sweeping space is desired to be 6 in. less than entire length of the step. Anchors are riveted on for pressed steel installations.



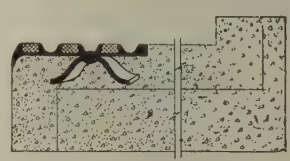


Concrete

Detail shows standard section 3½ in. with lip nosing. To give a wide walking surface 6 to 10 in. wide for stairs subjected to heavy traffic, this should be combined with one or more standard sections. Treads with anchors attached are centered between stringers and even with finish line of step

Concrete

Detail shows tread installation on concrete for stairs subjected to normal traffic. Single tread section with nosing is used to make a walking surface 3 in. wide. Anchors are attached



STANDARD SIZES WOOSTER SAFE-GROOVE STAIR TREADS

Section No.	Number of ribs	Width, in.	With or without nosing
Yellow Brass Base, Narrow Groove Type			
20	3	2⅛	long nosing
21	3	2¾	long nosing
22	4	3	lip nosing and sq. bk.
23	4	3½	lip nosing
24	4	3½	long nosing
25	5	4	without nosing
26	8	6	without nosing
27	4	3	without nosing
28	6	5¼	with lip nosing
Steel Base			
33	4	3½	with lip nosing
32	3	3	with lip nosing and sq. bk.
31	3	2½	without nosing
36	5	4	with lip nosing
34	5	4	without nosing
35	7	6	without nosing
White Brass Base Narrow Groove Type			
40	5	4	lip nosing
41	5	4	without nosing
42	8	6	without nosing
43	4	3	without nosing
44	3	2¾	long nosing

All sections (except the square back ones—No. 32 in steel base and No. 22 in yellow brass base—which are especially used in concrete construction) are made with angle back and can be combined with other sections to make any width desired.

STEEL BASE

Section No. 33, in Steel Base only, 3½ in. Wide, with Nosing and Angle Back.

Section No. 32, in Steel Base only, 3 in. Wide, with Nosing and Square Back.

Section No. 36, in Steel Base only, 4 in. Wide, with Nosing and Angle Back.

Section No. 31, in Steel Base only, 2½ in. Wide, without Nosing.

Steel Base cut to any desired length up to 17 ft.

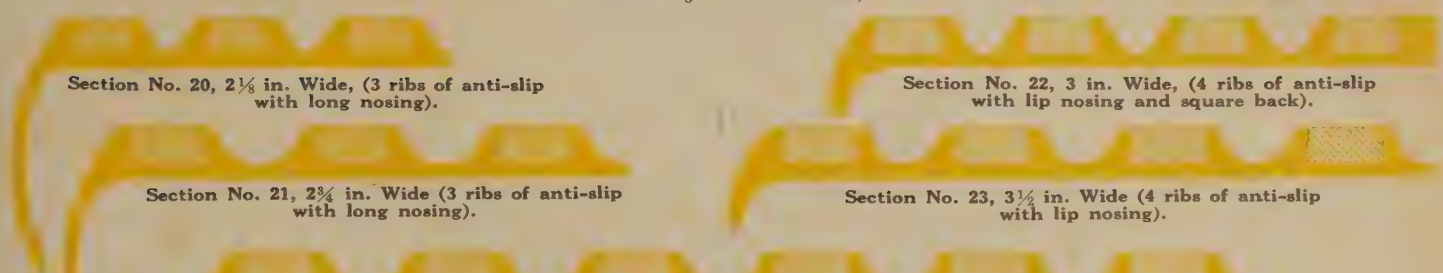
Section No. 34, in Steel Base only, 4 in. Wide, without Nosing.

Steel Base with abrasive grits or lead filler.

Section No. 35, in Steel Base only, 6 in. Wide, without Nosing.

YELLOW BRASS BASE

(abrasive grits or lead filler.)



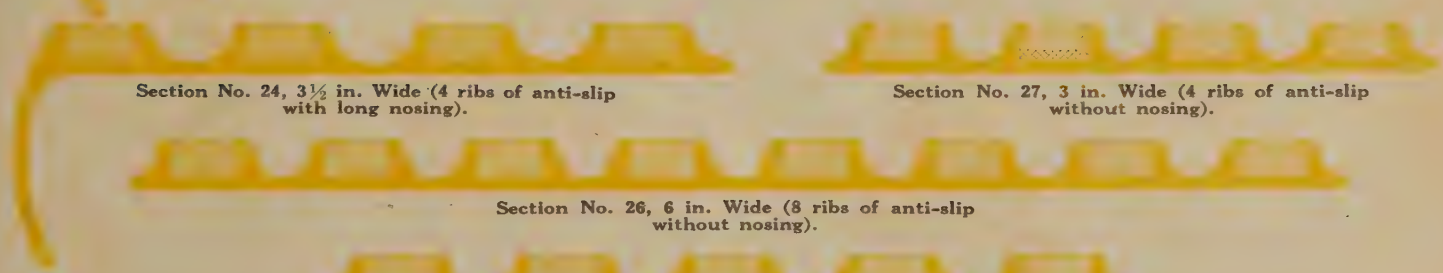
Section No. 20, 2⅛ in. Wide, (3 ribs of anti-slip with long nosing).

Section No. 22, 3 in. Wide, (4 ribs of anti-slip with lip nosing and square back).

Section No. 21, 2¾ in. Wide (3 ribs of anti-slip with long nosing).

Section No. 23, 3½ in. Wide (4 ribs of anti-slip with lip nosing).

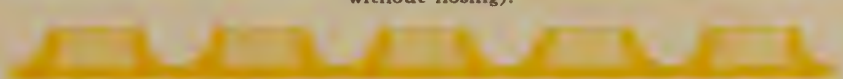
Section No. 28, 5¼ in. Wide (6 ribs of anti-slip with lip nosing).



Section No. 24, 3½ in. Wide (4 ribs of anti-slip with long nosing).

Section No. 27, 3 in. Wide (4 ribs of anti-slip without nosing).

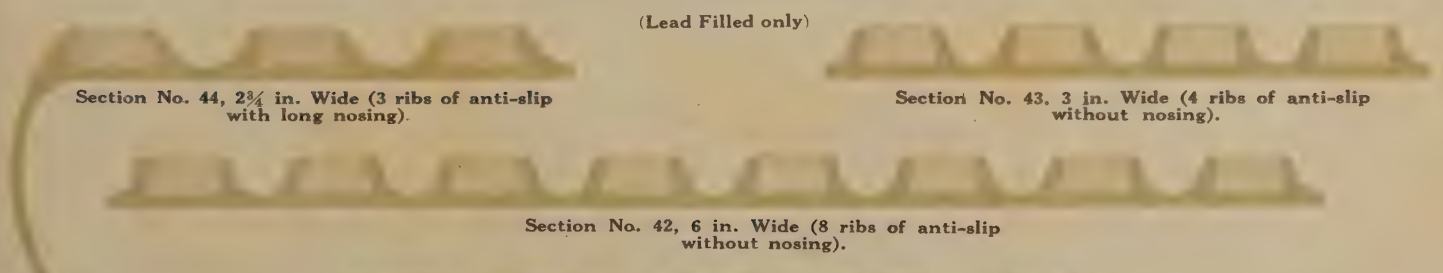
Section No. 26, 6 in. Wide (8 ribs of anti-slip without nosing).



Section No. 25, 4 in. Wide (5 ribs of anti-slip without nosing).

WHITE BRASS BASE

(Lead Filled only)

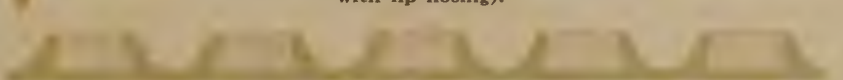


Section No. 44, 2¾ in. Wide (3 ribs of anti-slip with long nosing).

Section No. 43, 3 in. Wide (4 ribs of anti-slip without nosing).

Section No. 42, 6 in. Wide (8 ribs of anti-slip without nosing).

Section No. 40, 4 in. Wide (5 ribs of anti-slip with lip nosing).



Section No. 41, 4 in. wide (5 ribs of anti-slip without nosing).

Wooster Security Nosings

Wooster Security Nosings are designed to protect from the scuffing wear of traffic the edges of linoleum, composition, cork tile, rubber tile, or other flooring material when used on stairs, platforms or landings.

Material—Wooster Security Nosings are made of highly polished yellow brass and silvery white, non-rusting and non-tarnishing white brass.

Design—Wooster Security Nosing is of sturdy design and retains its smooth even surface for many years. The body of the nosing which extends down over the front edge of the step cannot be bent or dented by the ordinary shock of traffic. The nearly vertical lip securely locks the covering material in place, and the horizontal flange holds the nosing rigidly to the step. Flanges are feather-edged, an exclusive Wooster feature.

Sizes—Wooster Security Nosings are made in sections of different thickness for use with any flooring material from ⅛ to ½ in. thick. Full size cross sections are shown below:

Method of Application–All nosings are delivered cut to desired length, polished and drilled with proper number of countersunk screw holes for attachment. Wooster Security Nosings are fastened by means of screws through the countersunk holes in the horizontal flange. This flange is completely covered by flooring material, leaving nothing to show but attractive face of the nosing.

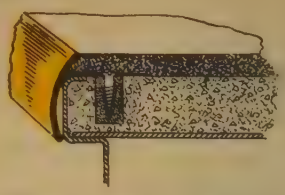
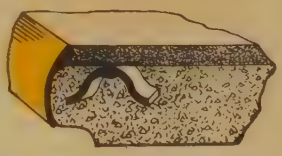
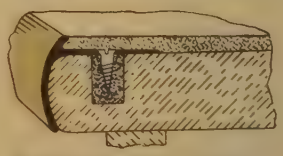
Wooster Security Nosing on Wood, No. 6 Wood Screw.



Wooster Security Nosing on Pressed Steel Stairs, Installed with Wood Screw in Shield or with Anchors.



Wooster Security Nosing on Concrete Stairs, Nosing Installed with Anchor Attached.



Wooster Security Nosing on Slate, Marble or Stone Construction, No. 6 Wood Screw in Lead Shield.

Wooster Security Edgings

Wooster Security Edgings are designed to protect the edges of linoleum, composition, cork tile, rubber tile or any flooring material from wear when laid on floors of any kind.

Material—Wooster Security Edgings are made in highly polished yellow brass in ⅛, 3/16 and ¼-in. thicknesses to match flooring material.

Design— Wooster Security Edgings have a slanting lip which locks the flooring material securely in place. A feather-edged flange, screwed or anchored into the floor, holds the edging firmly in position and is entirely covered by the flooring material. This feather edged flange is an exclusive feature in Wooster Security Edging.

Full Size Cross Sections

Products

Universal Anti-Slip Metal Tread (Abrasive) Type I.

Universal Safety Tread (Lead-Filled) Type II.

General Uses

Surfaces to be protected include all stairs and landings of any material, such as iron, wood, slate, stone, concrete or marble; ramps, runways, platforms, train pits, elevator door thresholds, saddles, ladders, frames around vault lights, coalhole covers, and all surfaces that might become slippery.

Universal Grit-Meter Tread in Color

This tread is constructed of a light metal baseplate to which is attached the hardest known abrasive with a soft Grit-Metal binder. There are no hard metal surfaces exposed to the foot, the diamond hard grains properly embedded withstand the most severe wear under heavy traffic. Owing to the fact that the abrasive material extends the whole thickness of the tread to the baseplate makes it non-slip for its entire life. The Grit-Metal material is simply used as a binder and filler between all the voids around the abrasive grains, but has the advantage of allowing the use of color. Grit-Metal treads are supplied in the three colors shown here and black which affords the architect still another avenue of expression along the lines which are engrossing the attention of the entire profession—the use of color in safety tread and its means of securing complete harmony between diversified materials.

Grit Metal

TREADS
IN
BLACK, BRICK RED, OAK,
MAHOGANY

Grit-Metal Safety Tread has a base plate that is offset at the nosing to allow the abrasive grain to be present at the very edge of the stair where the greatest wear comes.

The color and abrasive grains in Grit-Metal Treads goes through to the base plate and will always be present regardless of how many years the treads are down.

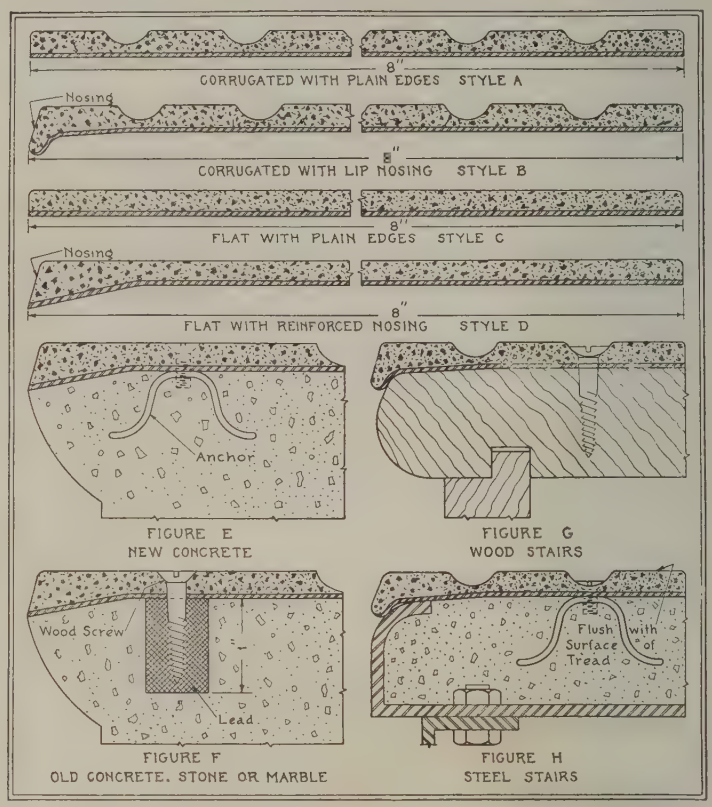
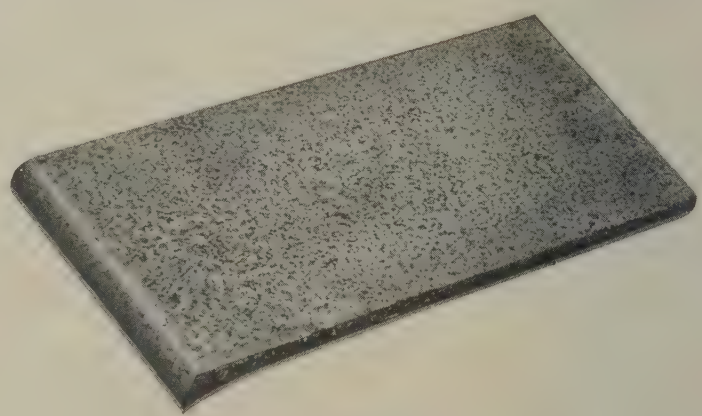
DETAILS OF TYPE I SAFETY TREADS





Flat Style D, with Reinforced Nosing

Universal Anti-Slip Metal Tread, Type I

This tread is constructed of a tinned steel base-plate to which is attached the hardest known abrasive with a soft lead binder. There are no hard metal surfaces exposed to the foot, but the diamond hard grains properly embedded to withstand the most severe wear under heavy traffic. Owing to the fact that the abrasive material extends throughout the whole thickness of the tread to the base-plate, makes it non-slip for its entire life. The lead is simply used as a binder and filler between all the voids around the abrasive grains. It is moistureproof, frostproof, non-porous, and scuffproof, and made in a flat or corrugated form as preferred. During many years of experience in the manufacture of safety treads, we have perfected a tread which fulfills the most exacting requirements.

Surfaces and Nosing — Universal Anti-Slip Metal Tread Type I is made with flat or corrugated surface—Style "A" representing the corrugated surface, plain edge; Style "C" representing the flat surface with plain edges; Style "B" representing the corrugated surface with "lip" nosing; Style "D" the flat surface with reinforced nosing.

The idea of having it reinforced as shown in Style "D" is to build the abrasive as a non-slip shoulder to a depth of almost ½ in. on the edge, which is the point of heaviest wear. This reinforcement practically doubles the life of tread. For hospitals and similar buildings a flat surface is recommended for its sanitary advantages.

Installation—The above show the methods of attaching Universal Treads on new concrete with special anchors as shown at Figure E, and on old concrete as at Figure F. As applied to old concrete or stone, it is necessary to drill holes about 1 in. deep and fill same with lead plugs or expansion bolts. The safety treads are then attached by means of ordinary wood screws into these lead inserts in the same manner as in the case of wood stairs as in Figure G. When the treads are to be installed on cast iron or steel, the sub treads have to be tapped and drilled for ½-in. tap screws, round or flat headed. The flat headed screws are generally preferred.

Holes—Universal Treads are provided with the required number of holes in the plates properly countersunk. In concrete work we furnish the special anchors as shown.

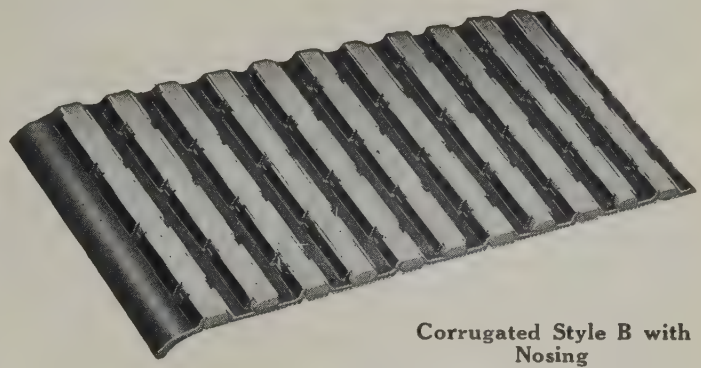
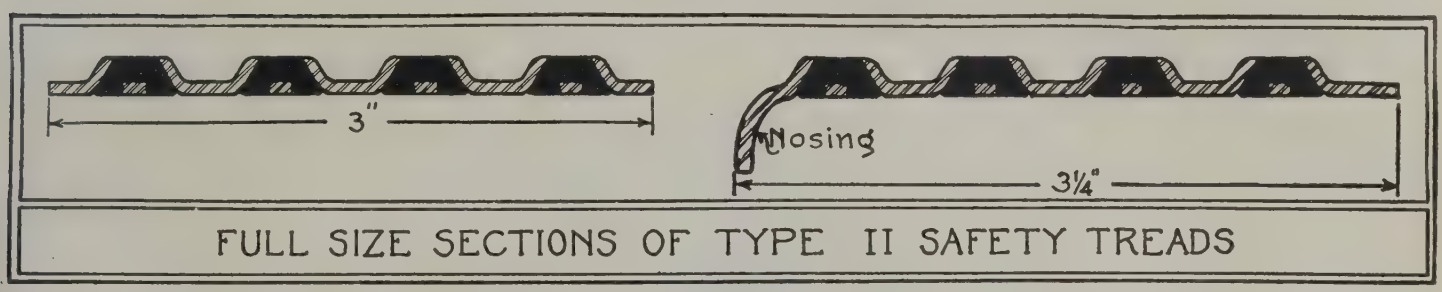
Corrugated Style A with Plain Edge



Corrugated Style B with Nosing

Universal Safety Tread (Lead Filled) Type II



Universal Safety Tread (Lead Filled) Type II

This tread is constructed of a steel, brass or aluminum baseplate, punched to receive the non-slip lead inserts which are rolled in and firmly clamped. The lead fills the perforations and a non-slip surface is presented for its full thickness. There are no continuous metal ribs on the outer edge, which is the danger point on all stairs, but the lead, being exposed between the steel or brass teeth, presents a non-slip edge at all times. This is especially important in descending stairways. A minimum of hard supporting metal and the maximum of non-slip lead form the wearing surface. Baseplate can be extended to form a nosing of any depth required. We can furnish alloy-coated or galvanized steel to resist the action of salt water or dampness. Our brass treads are also recommended where it is necessary to have a rustproof and safe surface.

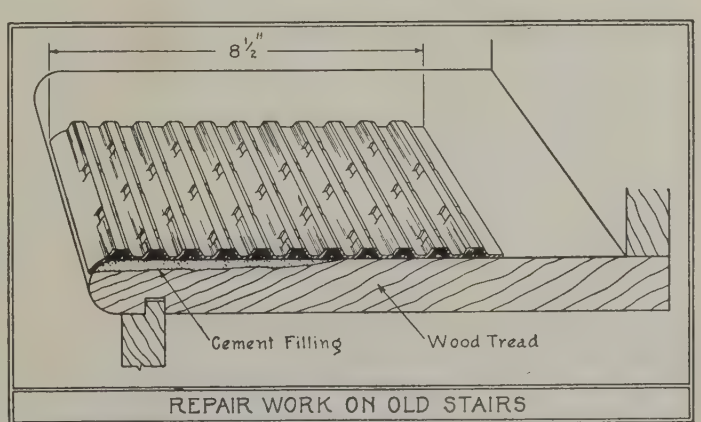
Sizes—Universal Safety Tread can be furnished in almost any standard width and in any specified lengths, either with or without nosing according to the requirements of the stairs or landings. We show some of the widths which are most commonly specified and used. We also show the way it is used on repair work on which the nosing can be extended to any depth desired to cover evidences of repair.

Cost of Safety Treads

The use of safety treads is a paid-up accident insurance during the life of the tread. All casualty companies demand a reasonable degree of safety on stair treads and traffic surfaces in all types of buildings and where their recommendations are followed there is a consequent saving in the cost of insurance. Damages from tripping or slipping on surfaces where safety treads have been provided have invariably been decided for the defendant. Accidents from falls on stairs in one year caused the death of 1,149 people and crippled for life more than 4,000 in this country. In New York City alone there were 118 deaths, and in Chicago, 37 deaths in one year.

Although wood, iron, stone, marble or concrete surfaces are supposed to be safe at first, after a short period of wear they are sure to develop to some extent a slippery and unsafe condition. The use of any of the various types of Universal Safety Tread Company's products will reduce these hazards to a minimum.

Use Safety Treads to Repair Worn Stairs



AMBLUCO NON-SLIP BLUE STONE STAIR TREADS AND FLOORING

QUARRIES AND MILLS
AMBLUCO, WYOMING CO., N. Y.

Produced by
AMERICAN BLUE STONE COMPANY
101 Park Avenue, NEW YORK, N. Y.

Products

AMBLUCO NON-SLIP STAIR TREADS and LANDINGS for interior steel and concrete stairways; AMBLUCO FLOORING, THRESHOLDS and WALL BASE for interior and semi-interior uses.

For Genesee Valley Blue Stone for exterior uses, and Naturcleft Flagging, see page A329.

Reg. U. S. Pat. Off.

Facilities

This company has well developed quarries on its own property of about 200 acres, located at Ambluco, Wyoming County, N. Y. The mills and yards are equipped with the most modern machinery so that large volumes of business can be handled without delay.

One building 150 ft. long, devoted exclusively to the storing and finishing of AMBLUCO Products, is heated during the cold weather so that orders can also be filled in the winter.

Ambluco Non-slip Stair Treads and Landings

These treads and landings have established themselves wholly on their own merits, with practically no introduction on our part. By those who have studied their qualifications or used them, they are declared to be superior to and more economical than any other type.

Attractive (Color and Texture)—The uniformity in color, even grained texture and standard sand sawed finish (free from saw marks and imperfections) combine to give a splendid appearance. The distinctive shade of light-blue blends well with adjacent light color surfaces or gives a sharp clean contrast with dark material. It is a fine and close grained blue stone, being made up mostly of pure, hard quartz as shown below:

MINERALOGICALLY CONSIDERED	
Fine, hard sand, mostly quartz	70%
Clay, as binding material	28%
Water	2%

Non-slip—The non-slip property, due to the fine grained quartz, does not grip the foot to cause tripping, but gives ample security against slipping at all times, whether wet or dry, without requiring resurfacing or replacing. These quartz particles are always uniformly distributed throughout the entire stone, a condition that is only produced by nature and prevents the surface from ever wearing smooth.

Durable—The extreme durability of the AMBLUCO Treads comes from the character of the material and the steadily increasing hardness of the stone brought on by the heat of the building, causing the treads to resist wear as they age. The density of the stone's structure which helps to give the remarkable wearing quality is revealed comparatively in the following table:

CRUSHING STRENGTH	
Rockport granite (Kidder's Hand Book)	17,750 lb. per sq. in.
Vermont marble	13,500 lb. per sq. in.
Genesee Valley blue stone	19,970 lb. per sq. in.

This blue stone weighs only, approximately, 150 lb. per cu. ft. (or 25 lb. per sq. ft. 2 in. thick) when cut ready to set.

Sanitary—AMBLUCO Non-slip Treads and Landings are easily kept sanitary. Their great hardness prevents generation of dust and permits clean sweeping and mopping. The flat, non-porous surface has no grooves or pores to collect filth and disease germs. The soffits may be painted without danger of the stain coming through the stone to the top surface.

Quiet—They are practically noiseless and do not resound from footsteps nor become loose and rattle. This quiet feature is a truly essential quality for most buildings, and especially for hospitals where many human beings are undergoing great suffering, and for schools where it is so important that the pupils' minds are not distracted from their work.

Fire Resisting and Rust-proof—The AMBLUCO Treads and Landings offer great resistance to extreme heat and are of inestimable value in fireproof construction. In contrast to many other treads these AMBLUCO treads do not become rusty themselves nor stain other adjacent materials.

Permanent and Economical—"Lasts the life of a school" is a fitting slogan, for, as indicated by tests and

Using Ambluco Treads; Pressed Steel Risers and Subtreads

Details of Ambluco Stair Treads

Continued on next page

reputed records, AMBLUCO Non-slip Treads give satisfactory service in an average school for 50 to 60 years, while observance shows that at the existing rate of advancements in scientific design and construction, a school is considered obsolete in that length of time and is frequently replaced by a new building. In fact, there are records where these blue stone treads have been removed in the wrecking of a school and the same treads later installed in a new school.

The initial cost of the AMBLUCO Treads (1½ in. to 2 in. thick) is about the same or less than other natural stone treads and the ultimate cost much less even than the cheap metal and composition treads.

The facility with which they can be set on the regular types of fabricated or pressed steel stair construction eliminates the great expense of specially designed steel members.

No maintenance cost is necessary after these blue stone treads are properly installed.

As a matter of fact, the AMBLUCO Treads and Landings can be safely adopted without first experimenting.

Specification Suggestions—AMBLUCO Non-slip Treads and Landings should be called by their trade-name, and although in many localities this name is well known, we suggest (to avoid substitution of inferior material) giving the additional information that they are produced by the AMERICAN BLUE STONE COMPANY, New York, N. Y.

The sand sawed or wet sand rubbed are the only two finishes which should be allowed. The former has proved entirely satisfactory and we endorse it as a standard. Planed and axed surfaces should be avoided.

AMBLUCO Treads and Landings are universally used 2 in. thick, but can be furnished down to 1½ in. Complete specifications will be supplied upon application.

Ambluco Flooring, Base, Treads and Risers, Alumnae Hall, Vassar College, Poughkeepsie, N. Y.
HUNT & HUNT, Architects

Accepted as Standard by Prominent Users—Subsequently to the standardizing on the AMBLUCO Blue Stone Treads by the City of Boston and its many suburbs in their schools and other public buildings, nearly all the rest of New England, recognizing the superior features of these treads, did likewise. Many of the leading school architects in the Eastern, Southern and Middle Western States specify them. The use has not been confined to schools, but has also been extended to other public buildings, such as hospitals, museums, colleges, churches, clubs, railroad stations and high class commercial buildings.

Also AMBLUCO installations are frequently made to replace worn-out treads of other kinds.

AMBLUCO Treads and Landings are used, for the most part, by architects and engineers long accustomed to incorporating in their specifications the best material for their work.

Ambluco Blue Stone Flooring, Thresholds, Wall Base, and Swimming Pool Coping

In these days of the exacting of high liability for accidents to mankind, the fundamental requirement in flooring is that it does not become slippery under any conditions. In this blue stone flooring, quartz, the essential constituent, being harder than the accessory minerals, is pre-eminent on the wearing surface at all times and makes the floor slip-proof and very durable. Besides the rust-proof, non-porous, dustless and sanitary qualifications of this flooring, it is quiet to walk on.

AMBLUCO flooring is either 1½ or 2 in. thick and is especially suitable for interior and porch floors in both regular and irregular designs, suggestions of which are shown on the following page. In case of an irregular pattern, it is advisable for economy to limit the number of sizes to about seven. If, however, a greater variety of sizes and shapes is desired, random sawed slabs may be shipped from the quarries, and then fitted and jointed by local cutters on the job. Joints of ⅛ to ¼ in. are usually used for the regular styles and ¼ to ½ in. joints are more in keeping for the irregular style floors.

Its sawed or rubbed finish gives a level surface on which chairs and other furniture do not rock, a feature so annoying with natural split stone.

Other delightfully artistic effects are gained by several methods. One, by varying the finishes—having some pieces sawed with sand and some with steel shot. Another, by omitting the washing of the stone after sawing, which gives a variegated coloring from the rust stain of the saws.

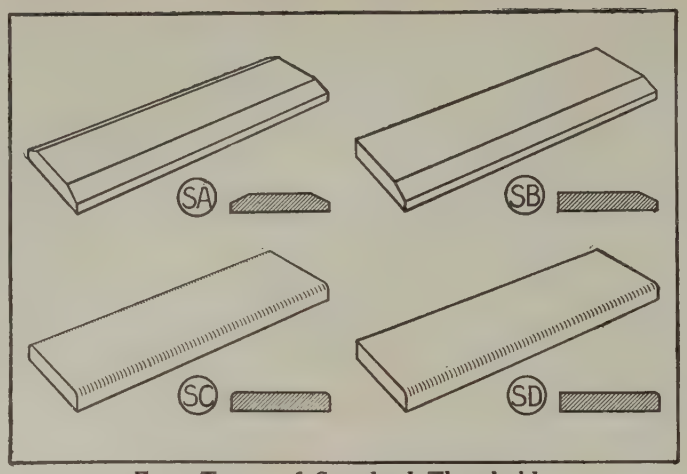
For interior swimming pools it is claimed to be in a class by itself for the border flooring and coping, for it is not dangerously slippery, does not injure the bare feet, and does not deteriorate and necessitate frequent replacements as do some manufactured floorings.

AMBLUCO Flooring is especially appropriate for,

Continued on next page

and is being used extensively in churches, cathedrals, museums, libraries, clubs, hotels, railroad stations, residences, high class commercial buildings, and the vestibules and stair halls of hospitals, schools and college buildings.

Perhaps in no place is there greater and more noticeable wear than in thresholds or saddles, and therefore, for this purpose, this AMBLUCO non-slip sand rubbed product is unapproached. These are furnished 1¼ to 2 in. thick by the desired widths, and with a choice of bevels.



Four Types of Standard Thresholds

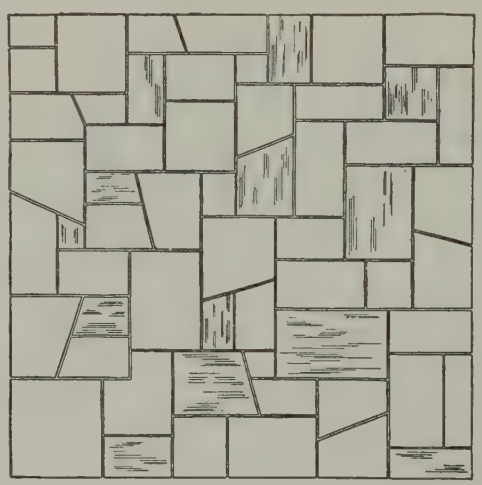
The AMBLUCO Wall Base and Plinths should be used to match the flooring and thresholds, landings and treads. The base and plinths are 1¼ to 2 in. thick by 7 to 14 in. high. A ⅛-in. radius round on the top front arris is usually given or a slight bevel is occasionally applied.

A fine sand rubbed finish is most appropriate, although the sand sawed finish frequently harmonizes better with certain styles of wall.

Specification Suggestions—It is important that this flooring, thresholds and base are specified by trade-name as described under the AMBLUCO Non-slip Treads.

For Flooring—The vestibules, lobbies, lounges (or whatever places desired) shall be of AMBLUCO Blue Stone, 2 in. [1½ in.] thick laid in regular [semi-irregular] [irregular] design (if irregular describe idea) with ¼ in. [½-in.] joints. It shall be set over a concrete fill and set in, at least 1 in. of mortar composed of 2 parts sand and 1 part portland cement. The joints shall be neatly pointed flush with surface of floor with same mortar, to which shall be mixed enough lamp black or other coloring to produce the desired effect.

For Thresholds or Saddles—All interior doorways for (.....) floors where cement, terrazzo or tile floor is used on either side, shall have AMBLUCO Non-slip Blue Stone saddles 2 in. [1¼ in. to 3 in.] thick by the full thickness of the partition wall in width, and the full width of the opening in length, with sand rubbed finish and 1x¼ in. deep bevel on each side. Joiner strips of AMBLUCO Blue Stone 1½ in. thick by 8 to 10 in. wide shall be used wherever different types of floor meet.



Irregular Design—FD

Random size blue stone slabs, showing variegated effect by combining sand sawed and shot sawed finishes. Laid with broken ½-in. joints

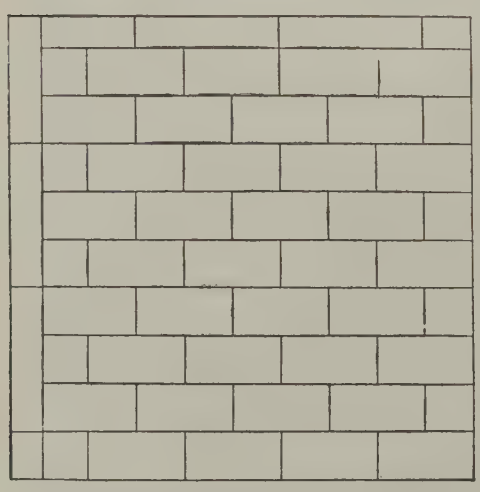
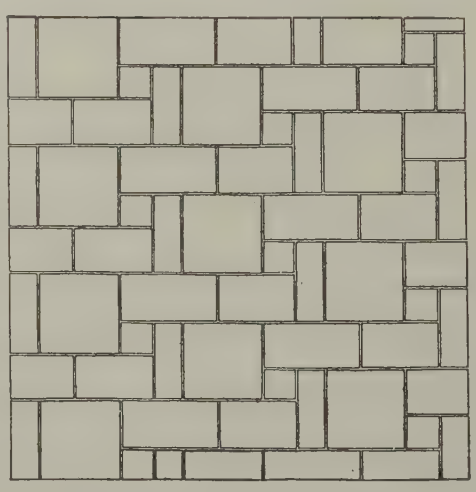
Suggestions for Care of Ambluco Products

After AMBLUCO Treads, Landings, Flooring, etc., have been installed they should be thoroughly scrubbed with sand and water until clean. No acid or other damaging substances should be used. If the light blue color is desired, coat with one or two applications of Truscon's Super Por-Seal. Repeat this six to eight times a year if needed. If it is preferred to have a darker shade, scrub and then paint with raw linseed oil. This can be done as often as will give the best results.



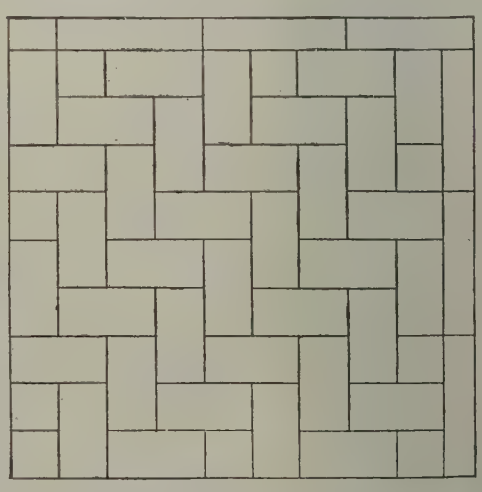
Regular Design—FA

Oblong blue stone slabs 24x12 in. laid with straight joints and transverse joints uniformly broken. Border of blue stone 8 in. wide



Semi-irregular Design—FC

Five different size blue stone slabs laid to a pattern with broken ¼-in. joints



Semi-regular Design—FB

Oblong blue stone slabs laid herringbone. Border of blue stone 8 in. wide

Alberene Stone

"Alberene Stone" is the trade-name of the ALBERENE STONE COMPANY for the natural stone produced at their quarries and mills at Schuyler, Va.

This stone is blue-gray in color, non-stratified and free from cleavage lines, dense and close grained, uniform in texture and hardness, practically non-absorbent, easily cleaned and kept clean. It is chemically inert and highly resistant to acids and alkalis. It is flame-resistant and non-conducting. It is fireproof and not affected even by the highest temperatures. It is easily machined—bored, slotted, grooved, tongued, turned—without splitting or chipping.

This unusual combination of qualities has won for Alberene Stone, for the purposes listed above, its leading place in the architectural and industrial world.

Production Facilities

This company's quarries and mills at Schuyler, Va., are the largest in the world devoted exclusively to the production of stone products of this character. Developed quarries have a capacity for 40 years' supply, while undeveloped properties indicate a reserve ample for 200 years. Both quarries and mills have the most up-to-date machine equipment and are connected by a standard gauge railway to the main lines of the Chesapeake & Ohio R. R. Co. and the Southern Railway Co. Systems. These resources and facilities, coupled with the company's specialized experience of more than 40 years, assure a uniform high grade of material and workmanship and prompt deliveries from ample stocks.

Architectural Service

The technical department of the company is prepared and qualified to draw specifications, plans and details on all construction problems involving the use of Alberene Stone.

The experienced counsel of the company's specialists is freely offered to all who may wish to avail themselves of it—without obligation.

Stair Treads, Landings, Flooring, etc.

A selected hard stone is used for this purpose, a stone which has a pronounced "toothed," non-slipping surface and is unaffected by moisture. One specially valuable feature of this material, reducing the fire hazard, lies in the fact that it will not break or crack under heat, or even when a stream of cold water is turned upon it when the stone is at a high temperature. This, combined with the pleasing light color, makes Alberene Stone a superior material for stair treads, landings and flooring where safety and durability are factors. Many instances are known where these treads have been in hard service for more than 25 years and are still in serviceable condition. Due to the lack of a standardized design, it has proven impractical to carry stair treads, landings and flooring in stock. Our mill capacity and supply of uncut stone enable us to make reasonable deliveries in any quantity.

A large majority of Alberene Stone installations are made by our own construction force whose services are always available to architects and builders.

AGENTS AND WAREHOUSE STOCKS IN VARIOUS CITIES

Neverslip Rolled Steel Floor Plates

NEVERSLIP floor plates are rolled from open hearth steel in two patterns—raised diamond pattern and straight corrugated (ribbed) pattern—under the original Linden patents.

"The Original Floor Plate with Raised Diamonds"

TRADE-MARK

Widely used for floors and stairways in buildings, boiler and engine rooms, powerhouses, factories, etc., and on bridges. Also for cellar doors, sidewalk covers, fire escapes, trench covers and in places where structural strength combined with lightness is required for a safe and durable surface.

Non-slipping and Durable

The raised diamonds of NEVERSLIP floor plates are high and have four square edges. The surface of the diamonds is approximately flat, providing an even non-slipping surface with maximum wear, surpassing other types whose rounded and pressed diamonds rapidly become smooth and slippery.

The corrugated pattern also has straight square edges which likewise provide safety and durability.

NEVERSLIP floor plates have no pockets which will permit accumulation of dirt and water and they can be readily cleaned.

Sizes

NEVERSLIP rolled steel floor plates are furnished in thickness from ⅛ in. to ½ in., in widths from 20 in. to 60 in. and lengths up to 240 in. Larger and thicker plates may be furnished if desired.

Specially light NEVERSLIP plates can be furnished in No. 12 and 14 gauge.

Thickness is measured through body of plate exclusive of diamond or rib.

Application

Wood floors or planking. Plates are fastened by lag screws or by ordinary wood screws (occasionally by carriage bolt with lock nuts and washers).

On steel work, stairways, etc., by bolting through the supporting members.

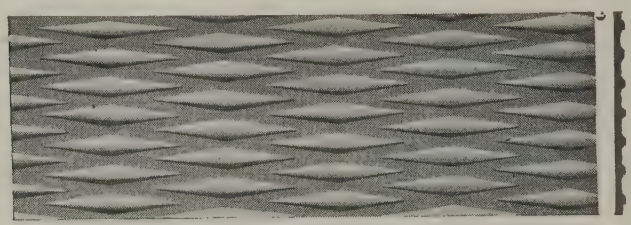
On new concrete floors, stairways, etc., arrangements should be made to lay floor plates flush secured to screw anchors, to expansion bolts, or to wood blocks set flush in the concrete.

Protection for Bridge Flooring

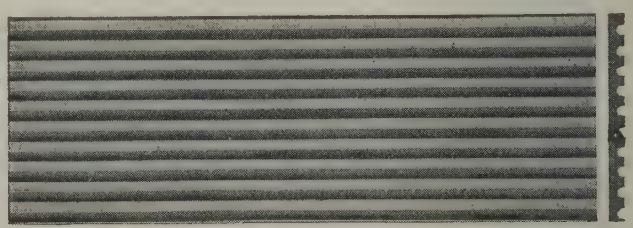
The placing of two lanes of floor plates 24 in. wide, spaced normal gauge of vehicles for the entire length of the bridge directly over the planking, eliminates maintenance cost in reflooring and strengthens the entire bridge.

The floor plates overcome vibration, chatter, rising spikes and planks so dangerous to automobile traffic.

Catalogue and samples on request.



Diamond Pattern



Ribbed Pattern

Neverslip Rolled Steel Floor Plates

Great Structural Strength

NEVERSLIP rolled steel floor plates have practically supplanted cast iron plates because of their greater structural strength, which is three to four times greater. They are also lighter and cost less.

"A.W." Rolled Steel Floor Plates

"A.W." Floor Plates are a rolled steel product and will therefore withstand the roughest usage without breaking. The entire production of these plates from raw material to finished product is done in our own plants and any of our patterns can be matched at any time—they are always uniform.

All plates have beveled edges on the patterns to assure firm foothold without cutting, and all are self-draining and cleaning.

Standard "A.W." Floor Plates—This is our heavy weight plate which has been standard for years for all forms of step, flooring, platform and runway construction where supporting strength as well as antislip qualities are necessary. This type is made in two patterns—Diamond and Ribbed.

The New "A.W." Diamondette—This is (to our knowledge) the lightest floor plate ever rolled and is made for flooring, platforms, walkways, etc., where raised antislip surface is required without necessity for supporting strength.

Made in No. 12 and No. 14 gauge (exclusive of pattern). Maximum sizes, 24x192 in. or 36x144 in.

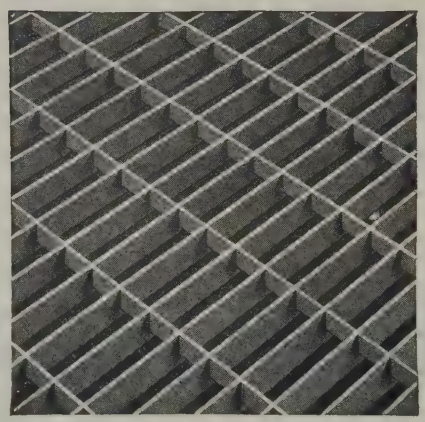
WALTER BATES STEEL FLOOR-GRATING



Walter Bates Steel Floor-Grating

Provides all the necessary flooring requirements peculiar to power plants, central stations, and certain types of industrial buildings. It is slipproof, strong, permanent, safe. Facilitates air circulation and light penetration. Relatively light in weight and low in cost. Requires no maintenance. Its even surface makes "easy going" for man or truck.

Non-clogging—Due to elimination of small openings and sharp angles it is impossible for dirt, grease or ice to form or accumulate. Always attractive and sanitary.

Positive Lock Joint—There are no welds, rivets or bolts in the construction of Walter Bates Steel Floor-Grating. Details below show construction. Once assembled, no amount of jarring, loading or trucking can shake the grating loose. In effect, it is a single unit throughout. There can be no rattle or chatter, regardless of age.

Note that in preparing the members for joining the extreme, or edge, fibres of the Main Bar "A" are uncut. Thus the most important and strongest metal is neither disturbed or reduced.

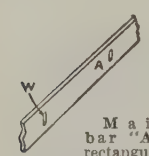
Applications and Uses—Floors and flooring in central stations, power plants, water works tunnels, galleries, walkways, runways, isles of safety, trolley loading platforms, railings, grilles, guards, fire escapes, ventilation shaft covers, sidewalk elevator covers, elevator and penthouse floors, etc.

Walter Bates Steel Step-Grating

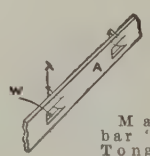
Provides a safe, slipproof stair step for indoor or outdoor use. Construction features, including positive lock joint, are similar to those on the floor-grating, assuring maximum strength, permanent life and lasting economy. Outer edge reinforced to prevent sag or wear. Furnished ready to be bolted to stair stringers.

Estimates and Descriptions

We will be glad to furnish additional information about any Walter Bates Steel Products; or to submit suggested layouts and estimates upon receipt of specifications or descriptions of requirements. No obligation incurred on the part of inquirer.

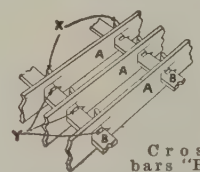


Main bar "A"; rectangular holes "W" punched approximately in center of the section.

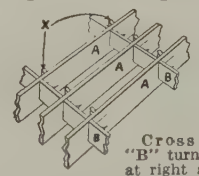


Main bar "A"; Tongues "X" then sheared same width as hole "W." Tongue is curved back, so that it protrudes to one side of Bar "A."

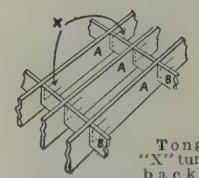
Cross bar "B"; notches "Y" made in bar at correct spacing center to center of notch.



Cross bars "B" inserted in slots "W," of main Bars "A."



Cross Bars "B" turned up at right angles to entry position so that notches "Y" straddle upper portion of main bars "A." Tops of "A" and "B" are flush. (Unsheared portion of bar "B" is same width as height of slot "W," making a tight fit.)



Tongues "X" turned back to original position held before shearing. (Since width of slot "W" was same dimension as thickness of Bar "B," tongue "X" presses tightly against bar "B," forming a positive lock.)

SAFE LOAD TABLE WALTER BATES STEEL FLOOR-GRATING

Explanation of Numerals in Column "X"

(1) Maximum Safe Uniform Load per square foot
(2) Deflection Under Maximum Safe Uniform Load in inches
(3) Maximum Safe Concentrated Load per foot of width
(4) Deflection Under Maximum Safe Concentrated Load

BLAW-KNOX COMPANY

Steel Grating, Open Flooring and Steel Steps

674 Farmers Bank Building, PITTSBURGH, PA.

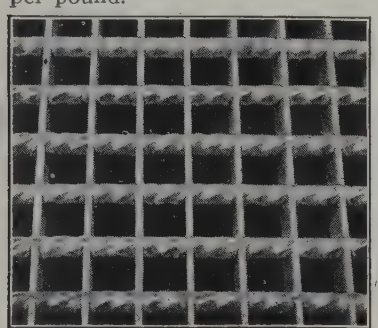
For List of Sales Offices, see page A196; for Steel Roof Sheathing, see pages A196-197

Blaw-Knox Electroforged Steel Grating and Open Flooring

Blaw-Knox Electroforged Steel Grating and Open Flooring is made by a resistance welding process in which longitudinal bars and cross bars are welded—electroforged—into an actual, not theoretical, one-piece construction. No slots, rivets, nor cuts in the metal. In a series of tests first conducted at Columbia University, New York, and lastly under the auspices of the Pittsburgh Testing Laboratory, in which leading commercial gratings were tested as to comparative strength, Blaw-Knox Electroforged Grating was conclusively proven to have greater strength than any steel grating tested.

Non-slip—Perfect traction is afforded by the slightly rough edges of the twisted cross bars, which protrude slightly above the surface of the bearing bars. Impossible to slip on Electroforged Grating.

Greatest Strength—The electroforged one-piece construction—made without rivets, slots, or cuts in the metal—utilizes the full strength of the gross amount of metal. The resulting one-piece section has a maximum loading capacity per pound.



Longest Life—Because of its design and exclusive method of fabrication Electroforged Grating presents a one-piece construction free from cracks, joints or crevices of any kind. It is the only grating which can be 100% galvanized or painted to give absolute protection against corrosion.

One-piece Grating—Blaw-Knox Electroforged Grating is manufactured by laying the twisted bars across the top of the bearing bars without slotting or cutting the metal. Enormous pressure and resistance welding electroforges the bars into one piece where the metals cross. Blaw-Knox Grating is the only one-piece grating on the market.

Self-cleaning—Because there are no acute angles or projections to collect debris, "Blaw-Knox" Grating is absolutely self-cleaning. An examination of its structure will illustrate this fact.

Better Light and Ventilation—The construction of Blaw-Knox Electroforged Grating permits clean-cut rectangular openings. Because a minimum of opaque surface is interposed between the light and its objective, maximum lighting and ventilation are assured.

Easily Installed—Installation cost of Blaw-Knox Grating is reduced to a minimum by a very simple and secure method of fastening grating. This method permits grating to be easily removed when necesary, without use of ladder or scaffold.

Blaw-Knox Steel Steps—Always Visible

Blaw-Knox Steel Steps are made in accordance with the same principle as Blaw-Knox Electroforged Grating.

The outer edges of these steps are made doubly visible by means of an additional set of cross bars placed between the two outer bearings as shown below.

These steps are furnished in all sizes.

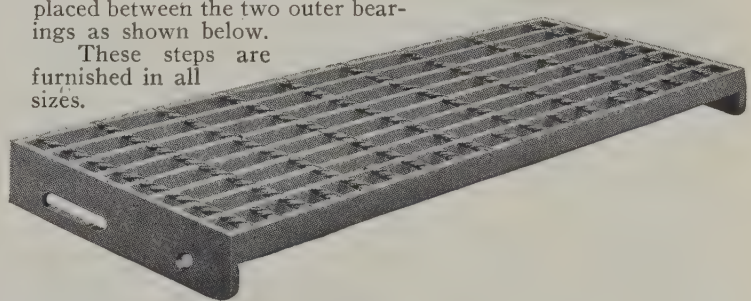


TABLE OF SAFE LOADS—BLAW-KNOX ELECTROFORGED GRATING

Maximum allowable fiber stress 16,000 pounds per square inch

"L"—safe uniform load in pounds per square foot. "W"—safe concentrated load in pounds per foot of width. "C"—deflection constant.

Note: Spans to right of heavy line not recommended.

Deflection: To obtain the deflection under any uniform load per square foot on a given span, multiply the load per square foot by the deflection constant, "C" from the table for the given span. The result will be the deflection in inches at center of span under the actual load. Actual tests have shown deflections average 23% less than these theoretical computations.

ESTABLISHED IN 1902

IRVING IRON WORKS COMPANY

Manufacturers of Open Steel Flooring, Walkway Grating and Safety Steps

Dutchkill Creek and Third Street, LONG ISLAND CITY, N. Y.

Products

IRVING OPEN STEEL FLOORING in paneled types; IRVING CONTINUOUS STEEL FLOORING; IRVING CONTINUOUS FLOOR ARMORING; "VIZABLEDG SAFSTEPS"; "SUBWAY", "SUNWAY", "SUBLIT", "EGGCRATE", "HONEYCOMB", "RETICULINE", and other forms of flooring and gratings.

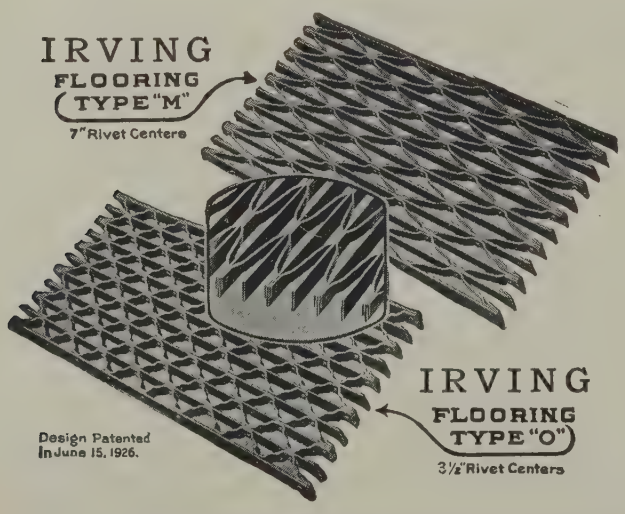
Trade-marks

The trade-mark names "Irvico", "Subway", "Reticuline", "Vizabledg", "Safstep", "Sunway" and "Sublit" are registered in the United States Patent Office, are the property of this company, and cannot legally be used in connection with any flooring, grating or safety step made by any other company.

Irving Open Steel Flooring

This is a structure of units or panels, consisting of alternate straight and "reticuline" steel bars assembled edge-on and solidly riveted together. The straight bars are of greater depth than the "reticuline" bars; the latter have an elongated "S" crimp and meet the straight bars at almost a right angle. Rivet holes are punched above the neutral axis of the straight bars, each of which is supported at its upper chord, where the buckling stress is greatest, by the adjoining "reticuline" bars. Thus the full tensile strength of each member is usefully employed, in a trussed structure in which a concentrated load is distributed over a wide area. This distinctive Irving construction results in the following structural superiorities: (1) maximum load capacity per unit of weight; (2) maximum effective area for lighting; (3) minimum opportunity for lodgement of dirt, ash, snow, etc.; (4) all bars absolutely flush on working face of panel; (5) all panels absolutely flat; (6) permanently non-slipping surface; (7) superior all-directional traction surface for trucks or tractors; (8) a pleasing pattern or design.

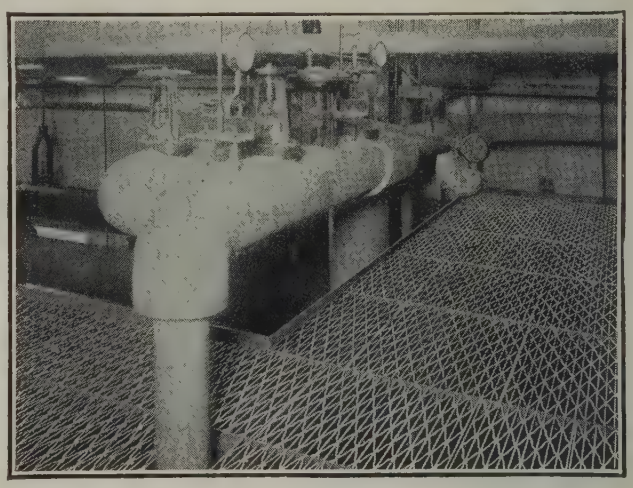
Irving Flooring is made in two standard meshes, as pictured here—Type "M", 7-inch rivet centers; Type "O", 3½-inch rivet centers. (Bulletin H-16.)



Two Standard Types of Irving Open Steel Flooring

Irving Continuous Steel Flooring

This is a unified structure, not a collection of separate panels, made up in standard Irving mesh—the individual sections being bolted together endwise and crosswise with staggered, offset, lapped joints, in a continuous trussed steel structure. A floor with all the distinctive advantages of standard Irving design, plus the outstanding superiority of continuity in every direction. (Bulletin G-16.)



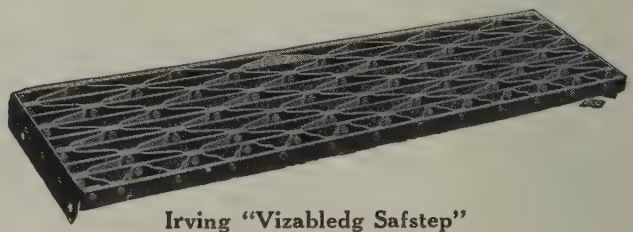
Central Station with Irving Open Steel Floor

Irving Continuous Floor Armoring

This is a structure of Irving Continuous Flooring, in light weight, bedded and anchored flush with the surface of floors of concrete, mastic, asphalt or composition —the mesh being filled with the flooring material, and troweled or rolled flush with the bars. This makes a floor proof against shock, traffic and wear, with a perfect traction surface and no opportunity for breaks or cracks to develop.

"Vizabledg Safsteps"

These are light, strong, all-steel units made of standard Type "M" Irving mesh, except that the "reticuline" bar next to the nosing bar has the Type "O" crimp. This abrupt change in mesh pattern forms a visible edge (Vizabledg) which makes the "Safstep" miss-proof; while the non-slipping Irving surface makes the "Safstep" slip-proof under all conditions. There are 24 standard sizes, each a self-contained unit with punched carrier plates ready for mounting. (Bulletin H-16.)



Irving "Vizabledg Safstep"

Publications

Individual bulletins, listed by numbers under each heading above, describe these products in detail and will be sent on request.

Continued on next page

Standard Construction of Irving Flooring

Spacing—*Types "M" and "G"*—$1\frac{5}{16}$ inches from center to center of straight bars when $\frac{3}{16}$ inch thick; $1\frac{1}{4}$ inches from center to center of straight bars when $\frac{1}{8}$ inch thick; rivet spacing, 7 inches center to center on straight bars.

Types "O" and "E"—$1\frac{5}{16}$ inches from center to center of straight bars when $\frac{3}{16}$ inch thick; $1\frac{1}{4}$ inches from center to center of straight bars when $\frac{1}{8}$ inch thick; rivet spacing, $3\frac{1}{2}$ inches center to center on straight bars.

Types "Q" and "K"—$\frac{15}{16}$ inch from center to center of straight bars when $\frac{3}{16}$ inch thick; $\frac{7}{8}$ inch from center to center of straight bars when $\frac{1}{8}$ inch thick; rivet spacing, 7 inches center to center on straight bars.

Standard Made-to-order Units—All types of Irving Flooring are also made to order for prompt shipment, to fit any opening and to meet any conditions. When made to order, Irving Flooring is shipped in units or panels properly marked and accompanied by setting plans.

These units—in the $\frac{1}{2}$, $\frac{3}{4}$ and 1-inch depths, if no larger than 24 inches wide by 72 inches long—and in the $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, 2 and $2\frac{1}{4}$-inch depths, if no larger than $13\frac{1}{2}$ inches wide by 72 inches long—sell at the regularly quoted square foot rates.

If larger than these sizes, there is a small extra charge. Anything smaller than these units is also standard and sells at the regularly quoted square foot rate.

We limit the size of the units, not only to simplify manufacture, but also to facilitate installation and to make removal or rearrangement easy.

Paint and Fastening Devices—Quoted prices always include one shop coat of paint, and fastening devices.

Orders—Orders should designate type, symbol and depth, to avoid mistake; thus "Irving Flooring Type M, 3S, $1\frac{1}{4}$ inch deep."

Show the supporting structure and outline the area to be covered. Let us make the Irving Flooring layout for your approval.

Deflections—To obtain the deflection under any uniform load per square foot on a given span, multiply your load per square foot by the deflection constant "C" from the table for your given span. The result will be the deflection in inches at center of span under your actual load.

Standard Sizes and Dimensions of Irving "Vizabledg Safsteps"

The tables in the opposite column show the standard sizes of Irving "Vizabledg Safsteps," which are complete units assembled with punched carrier plates attached, ready for setting.

Type "M" flooring is used for all sizes.

Standard Designs

The four standard designs of Kerlow Steel Flooring, (V, E, R, and L), are produced in thirteen thicknesses from ¾ to 2¼ in., inclusive, depending upon the floor spans and loads. All Kerlow floors are made entirely of steel or non-ferrous alloys, as the existing corrosive conditions demand.

Type "V"—The standard design for all floors, walks and steps.

Type "L"—The standard design used to prevent an accumulation of dust, as in cement plants or grain elevators.

Type "R"—The standard close mesh design for special floors. The strength and non-slip features are similar to Type "V."

Type "E"—The standard car mesh design used for railroad car steps and where very narrow spacing is necessary.

Advantages

The reversible Kerlow floor and step units are designed for hard use, heavy loads and continuous traffic. Each of these units is of one-piece steel construction, all members of which are full depth riveted together at their neutral axes. These units cannot become loose nor can they fall apart. There can be no integral tension nor compression strains to cause distortion and buckling.

Kerlow grating units are finished on both sides, give twice the service and cost no more. More steel is required to finish gratings on both sides and steel is the most expensive

TABLE OF UNIFORM SAFE LOADS PER SQUARE FOOT FOR "KERLOW"

Maximum allowable fibre stress 16,000 lb. per square inch. All intermediate bars ⅛ inch in thickness. Straight bars V1, V2, V4, V6, V8, V10, V12—⅛ inch thick. Straight bars V3, V5, V7, V9, V11, V13—$\frac{3}{16}$ inch thick. L—Uniform Safe Loads. C—Coefficient of Deflection. D—Deflection

Continued on next page

item required in their manufacture. Steel cannot be eliminated without a corresponding sacrifice in strength and durability. In properly designed steel gratings weight is synonymous with strength. Therefore, to give maximum efficiency, the grating should be the same on both sides. Send for a piece, not a sample, and test it out.

Uses

Kerlow floors, steps and guards are used repeatedly for powerhouses, coal tipples, smoke houses, elevator shafts, engine room floors, sidewalk areas and doors, car platforms, fruit canneries, door mats, armoring concrete floors, loading platforms, refineries, oil stills, dry kiln floors, refrigerator plants, warehouses, steel mills, cement plants, and for every conceivable purpose that a walking, working or ventilating surface should be used.

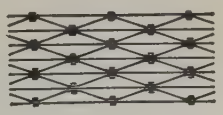
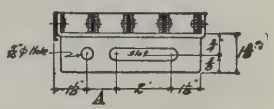
Standard Kerlow Units



Order these convenient Kerlow units by mark. They are made in four types—V, L, R or E in gratings Nos. 1, 2, 4, 6, 8, 10, 12 only.

Standard Size Steps Nos. T1 to T24

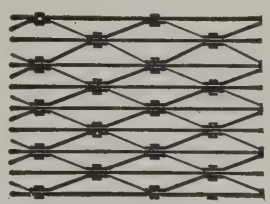


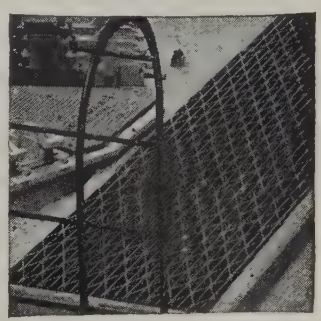
All steps are furnished complete with these carriers ready to use.

Size A—1 in. on 5¼-in. step; 3½ in. on 7¾-in. step; 4¾ in. on 9-in. step; 6 in. on 10¼-in. step.

Kerlow Type "V"

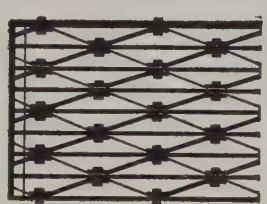
Standard mesh for all floors and stair steps. All bars equal depth. Maximum opening between bars 1 in. Rivets ¼-in. diameter, 6¾ in. on centers. See table for safe loads.

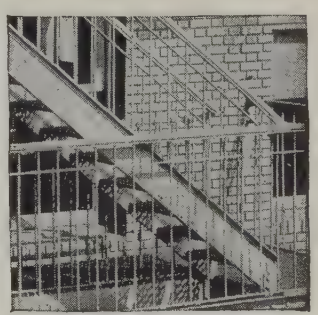




Kerlow Type "V" Stair Step

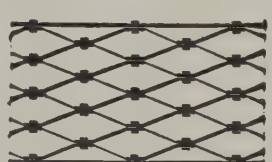
Standard Safety Stair Step complete with carrier ready to bolt in place. Made in 5¼, 7¾, 9 and 10¼-in. widths. See table for standard sizes and safe loads.

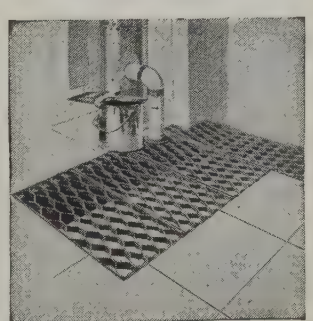




Kerlow Type "L"

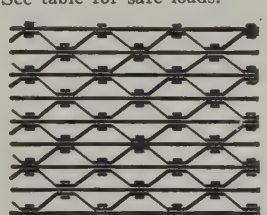
Open mesh for special conditions. All bars equal depth. Maximum opening between bars 2¼ in. All rivets ¼-in. diameter, 6¾ in. on centers.

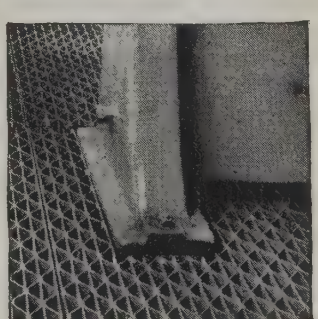




Kerlow Type "R"

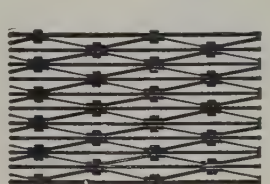
Close mesh for special floors and steps. All bars equal depth. Maximum opening between bars 1 in. Rivets ¼-in. diameter, 4 in. on centers. See table for safe loads.

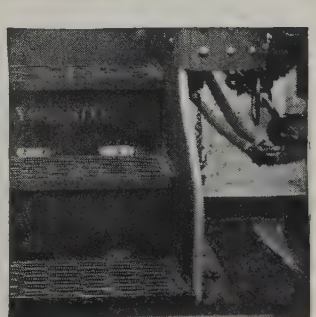




Kerlow Type "E"

Car mesh for railroad car steps. All bars equal depth. Maximum opening between bars ⅝ in. Rivets ¼-in. diameter, 6¾ in. on centers.





THE TRI-LOK COMPANY

Manufacturers of "Tri-Lok" Ventilated Steel Flooring and Tread

5531 Butler Street
PITTSBURGH, PA.

Product

TRI-LOK GRATING and TREAD, a ventilated steel flooring for purposes of transmitting light or air to areas above or beneath, or where extreme strength, durability, or fireproof construction is required with a minimum of weight.

Adaptations

In addition to the use of *Tri-Lok* as hereafter mentioned, it is excellently adaptable to the *reinforcement or surface armoring of concrete floors* wherever additional strength is required or wear is excessive.

A specialty is made of *safety stair treads and landings,* either in open form or concrete filled. The nosings, or front edges of these steps, are positively visible when ascending or descending the stairway. Style BD *Tri-Lok* Nosing is positively non-slipping (illustration C).

Accessories

Continuity bars for the purpose of joining sections of *Tri-Lok* Ventilated Flooring into a continuous span, thus making one integral floor with ample strength and no projections above the surface. *Tri-Lok fasteners* for making all attachments to supporting structures.

Construction

Consists of steel load bearing bars and load distributing bars, triple locked at right angles to each other (illustration A). The bearing bars are punched with curved slots exactly the same width and over-all depth as the cross or load distributing bars. In assembling, the bearers are set on edge with the slot uppermost, in a rigid steel frame which accurately spaces them and assures rectangularity of the finished unit. The bearers are arranged in such a way that the slots curve alternately right and left in adjacent bars. The cross bars are then started into the slots by hand to insure perfect alignment after which the entire unit is subjected to 1600 tons hydraulic pressure.

This drives the distributors to the bottom of the slots in the bearers and completes the triple or twist-and-turn lock, in other words, twists the lower edge of the distributing bars to the right and left at each side of the bearing bars.

Advantages

Strength and Deflection—*Tri-Lok possesses maximum strength per unit of weight of material.*

Since the bearing bars are not slotted or otherwise deformed below the neutral axis, and since all slots are solidly filled by the distributing bars forced into them, the carrying strength of the whole construction is the full equivalent of a solid of equal weight and depth. Deflection is a minimum.

Rigidity and Durability—The twisting of the distributors, alternately to the right and left as they cross the bearers, and the solid filling of the slots in the bearing bars by the cross bars, result in a joint which for rigidity, durability, and virtual indestructibility is unexcelled in this field.

Laboratory tests by Columbia University, the University of Pittsburgh, the Pittsburgh Testing Laboratory and Massachusetts Institute of Technology reveal that *Tri-Lok* joints remain absolutely unimpaired up to, and beyond, the failure point of the material.

Light Weight—Owing to the fact that every ounce of *Tri-Lok* construction represents the effective full strength of the steel, lighter materials may be used than when connections are made by means of rivets, bolts or welds. Comparison of safe load tables will disclose this fact.

Standard anchors, or fastening devices, which seem best suited to the conditions, are furnished with each installation of *Tri-Lok.*

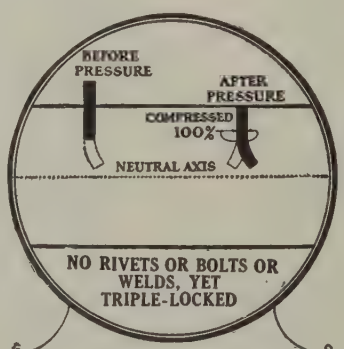
Illumination and Ventilation—*Tri-Lok* is approximately 90% open, thereby transmitting most effectively light and air to areas above or beneath, at the same time assuring absolute cleanliness.

Economy—Due to the triple lock construction a continuous flooring is assured and installation costs are reduced approximately 50% over other types.

In addition to the lower installation cost, the simplicity of *Tri-Lok* construction and its tremendous strength per unit of weight permits the accomplishment of a desired result with *Tri-Lok* at less cost than is usual.

Bent Over Cross Bars—Ask for our new bent over cross bars where edge bars are desired.

Our Service Department will gladly supply detailed literature and engineering data.



What a difference *three locks* make!

First, there is a right-twist lock in every other bar.

Second, there is a left-twist lock in alternate bars.

Third, there is the 1600-ton hydraulic pressure-lock, which is effected by *pressing* the cross bars into the two twist-locks.

Time nor wear can not open the three locks of TRI-LOK.

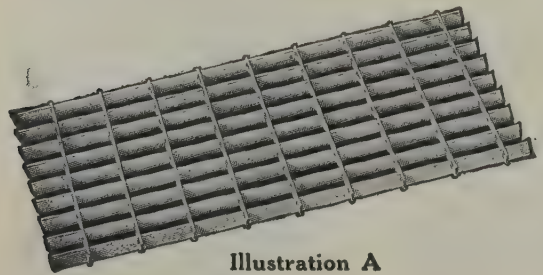


Illustration A

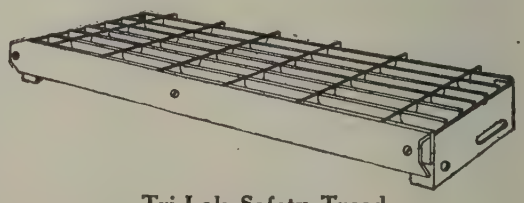
Some Uses for Tri-Lok

(1) "Tri-Lok" Ventilated Steel Flooring for—Area gratings, sidewalk doors, manhole covers, heating radiator guards, heating and ventilating grilles, automobile and truck radiator guards, conveyor walkways, boiler room walkways and platforms, window guards, cooling floors, fire escape landings, theater



Tri-Lok Safety Tread

Some Uses for Tri-Lok

(1) "Tri-Lok" Ventilated Steel Flooring for—Area gratings, sidewalk doors, manhole covers, heating radiator guards, heating and ventilating grilles, automobile and truck radiator guards, conveyor walkways, boiler room walkways and platforms, window guards, cooling floors, fire escape landings, theatre overhead walkways, flooring and walkways for power plants, pumping stations, waterworks, filtration and sewage disposal plants, chemical plants, oil refineries, foundries, cold storage plants, gas plants, etc. and sidewalk gratings for subways.

(2) "Tri-Lok" Concrete Armoring and Reinforcing for—Loading platforms, industrial floors, armories, stairs, roads and sidewalks.

(3) "Tri-Lok" Safety Treads for—Grain elevators, fire escapes, stairways in boiler rooms, power plants, pumping stations, waterworks, filtration and sewage plants, gas plants, etc., subway exits, street cars, railroad locomotives, freight and tank cars.

Some Users of Tri-Lok

United States Government for various departments
United States Steel Corp.
Delaware River Bridge Commission
N. Y. Board of Transportation for N. Y. Subway
Philadelphia & Reading R. R. Co.
West Virginia Pulp & Paper Co.
Consolidated Gas & Electric Co.
Union Light & Power Company
West Penn Power Co.
Dewey Portland Cement Company
Packard Motor Co.
Tidewater Oil Company
Aluminum Company of America
Essex Rubber Company
City of Cincinnati, Ohio
United States Gypsum Co.
Stone and Webster, Inc.
Dwight P. Robinson & Co.
Ford Motor Company
General Motors Corp.
The Toledo Furnace Co.
A. E. Staley Company
Pittsburgh Coal Company
Electric Bond and Share Co.
Phoenix Utility Co.

Standard Tri-Lok Safety Steps

The table of standard sizes as shown below, covers safety steps carried in stock for prompt shipment. Architects, engineers and designers are coming to realize the advantages in detailing their structures to conform with these standards as their building operations may be more effectively carried forward by the prompt service which can in this way, be given.

The cleanliness and simplicity of these safety steps may be seen from a study of illustration "C."

L—Safe load in lbs. per sq. ft. C—Deflection constant.

To obtain the deflection of any span, multiply the safe load figure by the deflection constant (L × C = Deflection). We do not recommend spans greater than those shown on the left of the heavy line in the table.

Type "GS"—Bearing bars 1″ apart; cross bars 2 7/16″ c. to c.
Mark "GS" 2¼ approved by Board of Transportation City of New York for Subways. Safe loads same as Type "G"

Type "GQ"—Bearing bars 1″ apart; cross bars 1 1/8″ c. to c.
Safe loads same as Type "G"
For use where 1″ square spacing is desired.

Other Types of Tri-Lok

Type "K"—Bearing bars 3/4″ apart; cross bars 4″ c. to c.
Type "KS"—Bearing bars 3/4″ apart; cross bars 2 7/16″ c. to c.
Type "KQ"—Bearing bars 3/4″ apart; cross bars 7/8″ c. to c. Gives 3/4″ square spacing.
For safe loads multiply Type "G" loads by 1.28.
Type "H"—Bearing bars 1 1/4″ apart; cross bars 4″ c. to c.
Type "HS"—Bearing bars 1 1/4″ apart; cross bars 2 7/16″ c. to c.
Type "HQ"—Bearing bars 1 1/4″ apart; cross bars 1 3/8″ c. to c. Gives 1 1/4″ square spacing.
For safe loads multiply Type "G" loads by .83.
Type "L"—Bearing bars 1 1/2″ apart; cross bars 4″ c. to c.
Type "LS"—Bearing bars 1 1/2″ apart; cross bars 2 7/16″ c. to c.
Type "LQ"—Bearing bars 1 1/2″ apart; cross bars 1 5/8″ c. to c.
For safe loads multiply Type "G" loads by .71.

For Car Steps and Running Boards

Type "F"—Bearing bars 5/8″ apart; cross bars 4″ c. to c.
Type "FS"—Bearing bars 5/8″ apart; cross bars 2 7/16″ c. to c.
Type "FQ"—Bearing bars 5/8″ apart; cross bars 3/4″ c. to c.
For safe loads multiply Type "G" loads by 1.42.

Especially for Concrete Armoring

Type "G"—Bearing bars 2 5/16″ apart; cross bars 4″ c. to c.
Type "GS"—Bearing bars 2 5/16″ apart; cross bars 2 7/16″ c. to c.
Type "GQ"—Bearing bars 2 5/16″ apart; cross bars 2 5/16″ c. to c.
For safe loads multiply Type "G" loads by .46.

Mitco Interlocked Steel Floor, Sidewalk and Driveway Grating; Mitco Shur-Site Stair and Ladder Treads and Mitco Armorgrids.

Also manufacturers of Window Guards, Perforated Metal Screens and Grilles.

MITCO
TRADE-MARK
Registered

Mitco comes in types and depths to fit openings of any size and shape. Panels of special widths for unusual conditions are furnished without additional cost. If you will give us an outline of the area to be covered, and indicate the location of supports, our engineers will gladly submit a suggested layout of Mitco panels with recommendations for depths and types.

With ample stocks of Mitco always maintained, we are in position to make prompt shipments of all sizes and types.

Write for new booklet, of particular interest to architects.

Mitco Interlocked Steel Grating

Mitco, the original interlocked steel grating, is fabricated from carefully selected square edge steel bars. No bolts, rivets or welding are used in its construction. Consequently, Mitco is high in strength and rigidity, as indicated by the accompanying table of safe loads.

TABLE OF SAFE LOADS AND DEFLECTIONS FOR "MITCO" GRATING
SAFE LOADS IN POUNDS BASED ON FIBRE STRESS OF 16,000 POUNDS PER SQ. INCH.
Loads can be safely increased approximately 50% without permanent deformation or undesirable deflection.

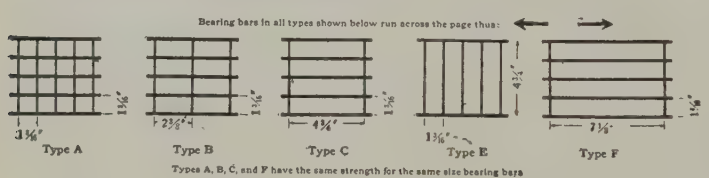
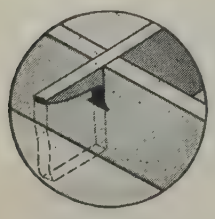
"D"—Deflection in inches for uniform live load.
Types C and E have same deflection for same spans.
Driveway can also be furnished in Type B having same strength as Type C and weighing approximately six lbs. per sq. ft. more.
For safe concentrated load at center of span multiply tabulated load by span and divide by two. This applies to both tables above.



Types A, B, C, and F have the same strength for the same size bearing bars

Mitco has rectangular openings, providing 90% open area maximum light and ventilation. Because of its rectangular openings with large open area, Mitco is non-clogging, easily cleaned and painted. Furthermore, Mitco surfaces are always smooth and uniform, making walking pleasant and trucking easy.



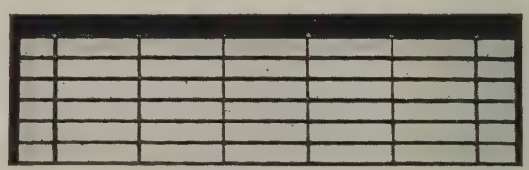
Mitco Lock Joints
Produced under hundreds of tons, hydraulic pressure, Mitco joints insure permanently locked panels, with flush and even surfaces

Mitco Shur-Site Treads

Made of 1-inch type C Mitco Grating, Mitco Shur-Site Stair and Ladder Treads have the same rectangular openings and the same non-clogging, non-slipping surface.

In addition, Mitco Shur-Site Treads have very clearly defined front edges—a deep nosing bar, bent back at an angle under the front of the Tread, makes the edge stand out clearly.

This nosing bar not only provides high visibility but also reinforces the Tread where the greatest strain comes, at the edge.



Mitco Shur-Site Tread
Note the high visibility and strength at the edge, provided by the deep nosing bar

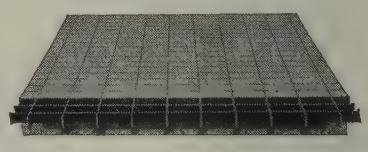
Furnished in five standard lengths and three widths, or in special widths and lengths to meet architects' requirements.

Carrier plates are applied, ready for attachment to stair stringers.

Send for booklet.

Mitco Armorgrids

Used for armoring, or reinforcing, surfaces of concrete or cement floors, platforms and driveways, Mitco Armorgrids insure a practically indestructible surface which will not crack out but will last indefinitely, even under heavy trucking or other severe service. Furnished in convenient sizes, Mitco Armorgrids are easy to install. Write for bulletin.



Mitco Armorgrids
Set on the rough slab, so that the finishing fill of concrete or cement brings the surface flush with the top of the Armorgrid panel, Mitco Armorgrids protect the surface and add greatly to its service life

H. V. BRIGHT

Manufacturer of Turnstile Equipment for Entrances and Exits

1104 Prospect Avenue
CLEVELAND, OHIO

Products

TURNSTILES, including Registering, Coin Controlled, Automatic Pattern and Non-registering Turnstiles.

METAL EXITS or BAFFLE GATES; also hardware for metal or wood Exits including ratchet, dogs, etc.

TICKET CANCELLING MACHINES.

Application and Service

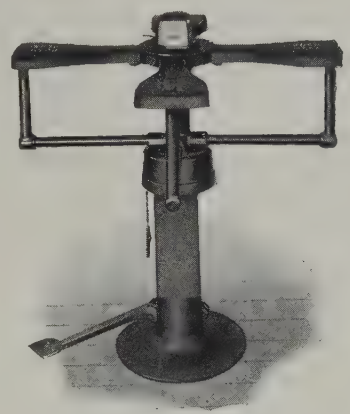
Can furnish turnstiles for any purpose desired, such as swimming pools, museums, libraries, pay-toilet rooms, self-serve groceries, stadia, baseball parks, university or high school athletic fields, amusement parks, expositions, fair grounds, railroads, ferry and boat landings.

This concern has been manufacturing and furnishing turnstiles for more than twenty-five years, and has furnished them for use at many different places including the baseball clubs of both the American and National Leagues, the Sesqui-Centennial and Municipal Stadium at Philadelphia, the Woodland Hills Park Swimming Pool at Cleveland, Grandstand at Illinois State Fair and others.

Suggestions and advice given for arrangement and building of entrances and exits. Write us what you have in mind.

The "Bright" Printing Register

The "Bright" Printing Register for turnstiles furnishes a printed record of the opening and closing numbers of the turnstile register on a record slip, in a convenient form for filing or reference. It eliminates the chance for error in reading and writing down the figures from the register.



Automatic Pattern Registering Turnstile "D"

Can be used for either cash or ticket admissions. It embodies especially desirable features particularly in that the patrons practically operate the turnstile themselves as they go through —the attendant or gatekeeper's duty being to collect the tickets or money. It is not a coin controlled turnstile.

It is equipped with air shock absorbers that check the arms at each quarter turn. Can always be under control of gatekeeper by use of foot lever.

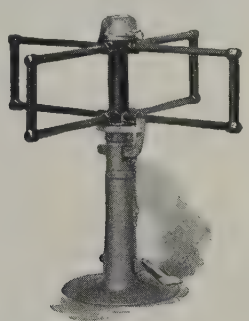
The top broad arms are aluminum, furnished any color desired, the aluminum making for both lightness and strength. The base and center are of gray iron. Both center and arms are black japan finish

Ticket Chopper "K"

The above is suitable for many places where it is desired to cancel the tickets.

This Chopper punches clean holes in the tickets and leaves their surface smooth so that they can readily be counted if desired. Plate glass with heavy brass trimmings is used for the top.

The cabinet can be furnished in any finish desired such as oak, mahogany, white enamel, etc.



Registering Turnstile "A"

This machine is more generally used in connection with tickets and is suitable for many places where a lower-priced Turnstile is desired.

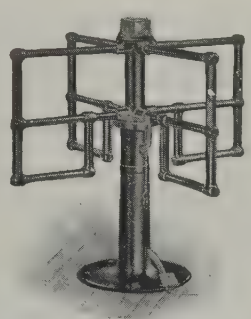
The base is of gray iron, levers of malleable iron, arms of steel tubing and iron castings.

Turnstile "A" is successfully used at many places. It is under control of the gatekeeper or attendant by use of the foot lever. Furnished with either the printing or plain register

Coin Controlled Registering Turnstile

With this Machine, the coin must be dropped into the slot of the Coin Machine cabinet before the arms of the Turnstile will revolve passing the person through. Can be furnished to operate with 50¢, 25¢, 10¢ or 5¢ piece. It is positive in its operation—does not require electric power.

Used by many of the Fair Associations where the admission is a single coin. Being automatic, can be used at entrance to Toilet Rooms.

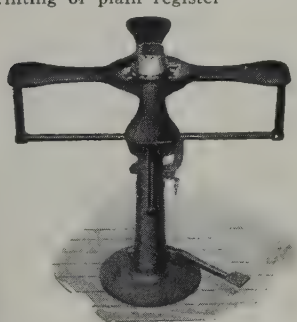


Registering Turnstile "B"

The above Turnstile is equipped with the Drop Arms, an added protection in that it makes it just that much harder for anyone to crawl under the arms of the Turnstile.

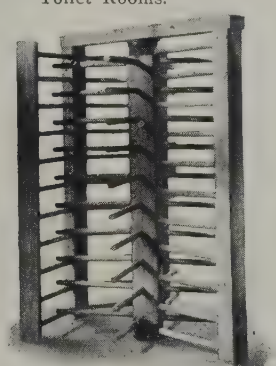
Is suitable for Libraries, Museums, Baseball Parks, Amusement Parks, Swimming Pools, Stadiums, etc.

Can be used for an inside Exit Turnstile if desired



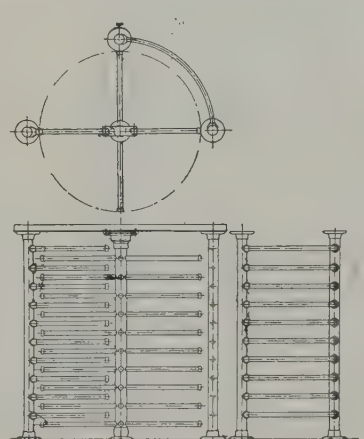
Turnstile "A" with Broad Arms

The above cut shows the Turnstile "A" equipped with the Broad Arms, the idea being to lessen the possibility of two people passing through the Turnstile on one registration



Wood Exit Turnstile or Baffle Gate

The above operates one way only and no attendant is necessary. The Hardware only is furnished for the above Exit, this consisting of the top and bottom castings, ratchet plate, dogs, etc. A blueprint is also furnished giving the dimensions, etc. of the principal wood parts used in the construction so that if desired the complete Exit Turnstile can be built in your own locality



All Metal Exit Turnstile or Baffle Gate

Center post of Turnstile of 4½ in. o.d. iron pipe with arms of 1⅞-in. o.d. iron pipe.

The outside posts carry the baffle and curved guard rails.

Will furnish complete shipped knocked down; or installed and ready for use on job —will furnish hardware only including ratchet, dogs, etc., if desired

PEREY MANUFACTURING COMPANY, INC.

Turnstile Systems and Mechanisms for Registering and Controlling the Movements of the Public

101 Park Avenue, NEW YORK, N. Y.

Where Perey Equipment Is Used

Perey Turnstiles, Passimeters and Baffle Gates are recognized as standard equipment in the following public places:

Swimming Pools, Natatoriums, Bathhouses, etc.—For entrances for collecting admission fees and accurately registering the number of persons entering. For exits, re-checking the number of patrons and preventing the removal of rented property. For interior control, directing the movement of patrons as desired without an excessive number of attendants.

Athletic Stadia, Baseball and Football Fields, Race Tracks, etc.—Perey Passimeters or Coinpassors for entrances and Non-registering Turnstiles or Baffle Gates for exits are regarded as standard equipment everywhere.

Amusement Parks, Expositions and Fair Grounds—Leading enterprises of this character are equipped with Perey Passimeters and Exit Gates at both main entrances and concessions.

Public Parks, Botanical Gardens, Zoos, Museums, etc.—Perey Passimeters are standard equipment for entrances where registration is desired or admission fees charged and Perey Non-registering Turnstiles and Baffle Gates for exits and points where control of the movements of the public most economically is necessary.

Railroads, Street Railways, Elevated Railways, Subways, Ferries, Boat Piers and Landings—Perey Passimeters and Coinpassors are widely used where flat fares are charged and collection can be made at pre-payment or post-payment stations. Perey Non-registering Turnstiles and Baffle Gates are used for non-attendant exits and control points.

Public Lavatories—In railway stations, bus terminals, hotels, baseball parks, arenas, dance halls, rinks, amusement parks, public buildings and elsewhere, public pay lavatories are controlled most effectively and made to pay their upkeep with Perey Coinpassors.

Architects Are Invited to Consult Perey Engineers

Our engineering staff is always ready to advise architects about systems and mechanisms for registering and controlling people in public places and for collecting fares and admission fees.

As originators of the Perey systems of personal registration and control, and fare and admission collection, we are in position to offer authoritative advice, for our experience covers all phases of the subject. As builders of Perey Turnstiles, Passimeters, Baffle Gates, Electric Fare Boxes and Registers, and the Coinpassor, the non-electrical coin controlled turnstile used throughout the world, we can furnish equipment to meet any requirement and any condition.

It is advisable for architects designing plants and structures of the types enumerated, where accurate mechanical registration of people or means of controlling their movements are desired, to consult us in advance of construction to ascertain the most suitable system and mechanism for the purpose, and to plan for its use in the most efficient way.

Illustrated below is a typical installation of the Perey Passimeter showing arrangement of cashier's booth, guide railing, etc. We suggest you write us concerning your propositions involving turnstile equipment and let us supply you with data.

A Swimming Pool Entrance Fitted with Perey Standard Passimeters

Here cashiers collect admissions and admit patrons directly without tickets or ticket takers. Every admission registers automatically and must tally with the cashier's receipts

POTTER MANUFACTURING CORPORATION

Manufacturers of the Potter Tubular Slide Fire Escape

107 West Washington Street, CHICAGO, ILL.

Product

POTTER TUBULAR SLIDING TYPE FIRE ESCAPE—inspected by the Underwriters' Laboratories, Inc., and listed as standard.

Description

The Potter Tubular Fire Escape is designed especially for schools and hospitals. It consists of a copper-bearing galvanized sheet steel straight tube with entrances from room through doors equipped with panic bolt hardware and exit from horizontal section at ground level. Supporting brackets every three or four sections. The incline of the tube for the school type escape is about 30° and for the hospital type about 35° to horizontal.

Advantages

It is safe, rapid, strong, durable and economical.

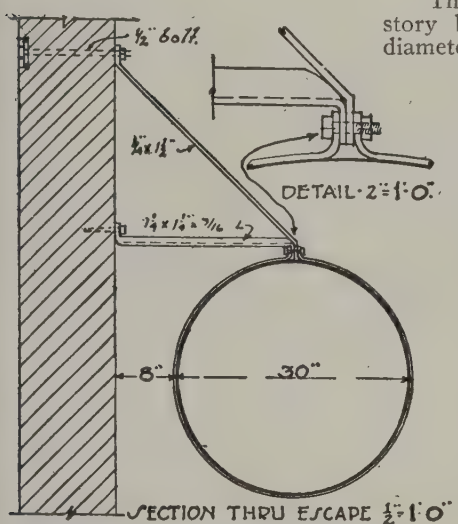
It can be entered direct from the schoolroom, thus permitting quicker exit.

There is no possibility of any one who uses it getting hurt. Slipping, falling, stumbling, pushing and confusion are all eliminated. Being enclosed, the occupants are fully protected from falling obstacles, flames, smoke, ice and snow.

Sizes

The school type for two-story buildings is 30 in. in diameter; for three-story buildings it is 30 in. in diameter from the third floor and 36 in. in diameter from the second floor to the ground.

The hospital type is 36 in. in diameter. This size is recommended for hospitals, as it will accommodate bed-ridden patients on mattress.



Specifications

School Type—Entrance to the escape to be 30 in. wide, 42 in. high; sections to be 30 in. in diameter and not more than 38 in. long and have 1¼x⅛-in. angle iron bands riveted to each end and be joined together by bolting the outside faces of the angle iron rings together with ¼x1-in. stove bolts. A channel iron band is placed over the top of the angle iron bands to make the joint watertight. The elbow shall have a sweep of 8 in. The easement or lower end breaks from the 30° angle to horizontal, is about 6 ft. long, flares from the 30 in. diameter to oval shape 36 in. high by 30 in. wide and rests on a concrete base 16 in. high. The incline of the tube is about 30°.

Lower End of Hospital Type Escape

The lower entrance for the double opening escape is the same size as the upper entrance. The increase in diameter from 30 in. to 36 in. is made in the "Y" joint where the lower entrance connects into the main tube.

Escape is secured to the building with brackets, at least one set for every four sections or fraction thereof, exclusive of the entrance, elbow and easement. Entrance on inside of building to be closed with double doors 15 in. wide, 42 in. high, equipped with panic bolt hardware, operated with push bars on each door, door to swing into the entrance of the escape. An all-metal entrance unit—including doors, casing, threshold, etc.—can be furnished at a slight additional cost.

A horizontal swing bar shall be placed near the top of the entrance, just outside the door, for the occupants to grasp with hands when entering the escape. Swing bar to be ¾ in. in diameter.

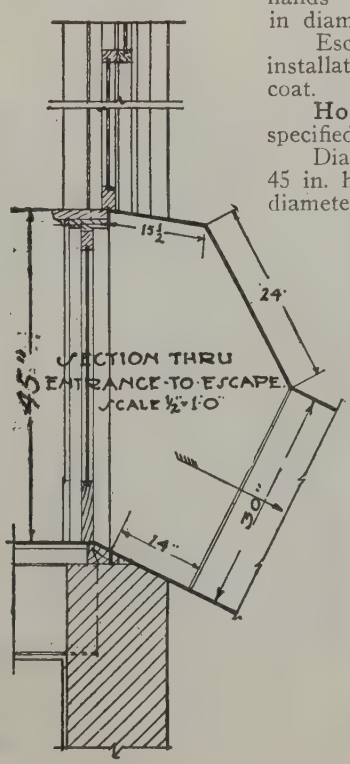
Escapes shall be painted one coat in factory and, when installation has been completed, they shall be painted a second coat.

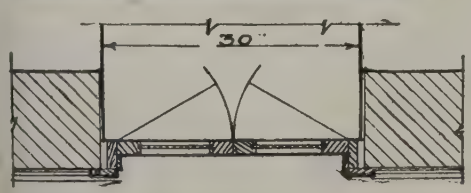
Hospital Type—Same as for school type, excepting as specified below.

Diameter of tube to be 36 in. Entrance shall be 40 in. wide, 45 in. high at inside wall line of building and flare to 36 in. diameter at the outer extremity. No increase in diameter is made where additional floors are connected into the tube. Elbow shall have a sweep of 40 in.

The easement, or lower end, breaks from 35° angle to horizontal and is about 9 ft. long. The easement rests on a concrete base about 4 in. high. The incline of the tube is about 35° to horizontal.

Complete detailed specifications on request.





ACME WIRE & IRON WORKS

Manufacturers of Standard Wire Mesh Partition Panels and Window Guards

TELEPHONE
HOGARTH 4616

12340 Cloverdale Avenue
DETROIT, MICH.

Products

Manufacturers of STANDARD RED RIBBON WIRE MESH PARTITIONS and ENCLOSURE PANELS.

WIRE MESH ENCLOSURES for Cashiers and Clerks.

Also Square Mesh Wire Window Guards; Wire Mesh Guards for Skylights; Steel, Brass and Bronze Grilles and Wickets; other products in Wire Mesh and Light Ornamental Iron Work and manufacturers of Brass, Bronze or Nickel Tubular Railing.

Standard Products

Red Ribbon partition and enclosure panels are carried in stock in sufficiently large quantities to permit a good sized order being shipped in twenty-four hours. They are designed to meet varying conditions and being in standard sections they are *100% salvageable*. They can be added to, from time to time, with the assurance that the new parts may be mingled with the old, with no field work to make parts match.

Being manufactured in quantities, all economies in the way of labor and the machine method of construction is used, keeping costs to a minimum.

It will be noticed that the multiplicity of parts has been avoided, enabling erection in the field by inexperienced help.

Construction Specifications

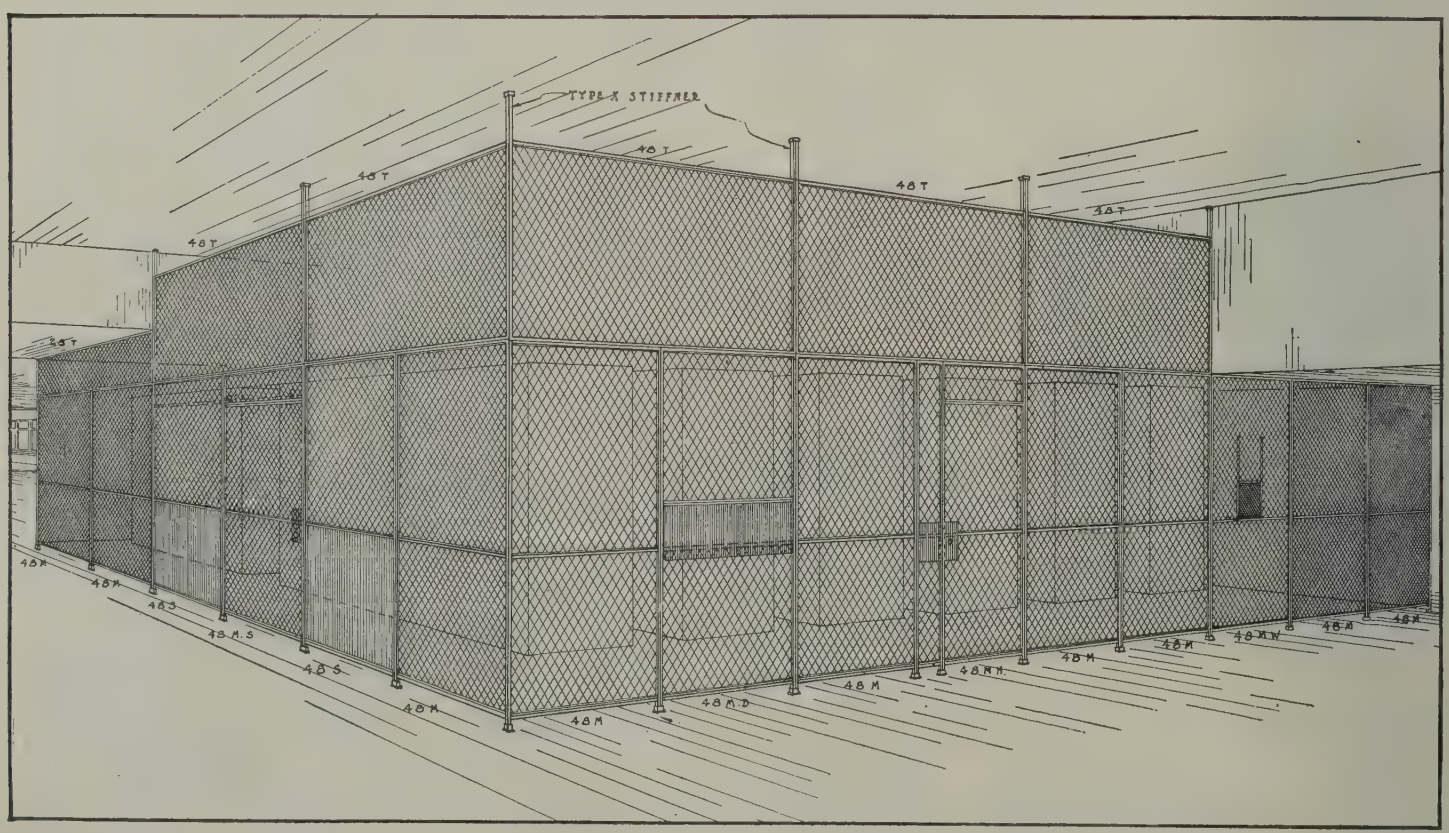
General Specification—Wire is No. 10 W&M gauge, crimped and interwoven to 1½-in. diamond opening mesh, measured parallel with the wire. Mesh is securely clinched into 1x½x⅛-in. steel channel frame. Crossbars are composed of two 1x⅜x⅛-in. channels, riveted together through the mesh; 3-in. sweeping space is provided at the floor.

Standard partition panels with mesh full height are designated as Type "M."

Type "S" panels have No. 16 gauge sheet metal base. Base is welded to the channel framing surrounding it.

All standard panels measure 4 ft. wide and 8 ft. high, excepting at the ends of partition, where a special panel can be provided to fill in the balance of the space.

If height greater than 8 ft. is required, top panels designated as Type "T" are provided, which panels usually span two of the standard partition panels.



Continued on next page

Doors—Sliding doors are equipped with special roller bearing hangers and flat bar track and will fit between any two panels. They have stops, guides, lock protecting plates and receiver for locks. Doors come in 4, 6 and 8-ft. widths. All doors are 7-ft. high opening, and have transom panel. 4-ft. wide doors are arranged to lock with a special bronze flat key claw lock. Because of the width, 8-ft. doors are arranged to lock with padlock (padlock not included).

Hinged doors lock with a Yale No. 042 R night latch with lock-protecting plate. Three steel tight pin butt hinges. Stock doors are 3 ft. wide by 7 ft. high and have a transom panel and side panel arranged to fit into a 4-ft. wide opening.

Windows—Type "SD-MD" is a drop shelf window panel 4 ft. wide, 8 ft. high and will also fit any other panels. The shelf which folds up, closes and locks the opening, is No. 10 gauge steel and has folding arms to stiffen same when used as a shelf.

Type "SW-MW" is a sliding window for use in passing requisitions or other papers through; can also be used for small tool passing, can be locked open at various heights or locked shut.

Top Panels—Type "T" panels are in various heights and designed to cross two base panels acting as a stiffener to the entire partitions. These panels are to permit higher partitions to the ceiling. They will receive the bulk of the cutouts for sprinkler, steam and water pipes for cross beams, etc., eliminating cutting into the more expensive base panels, and when partitions are rearranged are the only panels that it may be impossible to use in a new location because of cuts, etc.

Cap Bars—Cap bars are 1¼x¼ in. and can be fitted to the top of any partition; they act as an excellent stiffener to any partition. No drilling is required to make them fit—they are started in the center of a panel and always end in the center of a panel.

Stiffener Braces—Two types are shown, one for a wooden ceiling, another for concrete. The one for the concrete ceiling recommends itself particularly because it lowers the entire erection cost. A ½ or ⅝-in. hole is punched into the concrete, the bar pounded into the hole and tightened to the vertical member of the partition; no lag screws, bolts, shells or lead packing is used.

In some cases, a type "D" flat bar is desirable to stiffen panels. Where this is done $\frac{5}{16}$ in. must be added to the length for each bar so used.

Floor Shoes—Of cast iron, can be used on any floor; designed to keep partition from shifting. Are placed after entire partition is lined up. On concrete floors partition can also be anchored or cemented into the floor.

Paint—Standard paint is one dip coat of black asphaltum. Other finishes special.

ACORN WIRE AND IRON WORKS

Wire Mesh Enclosure Panels, Wire Cages and Wire Window Guards

TELEPHONE
NORMAL 1895

5906 Lowe Avenue
CHICAGO, ILL.

Products

Manufacturers of ACORN WIRE MESH ENCLOSURE PANELS; CAGES for Banks and Offices; DIAMOND MESH WINDOW GUARDS; COLLAPSIBLE FOLDING GATES; CLOTHING RACKS.

Also manufacturers of Skylight Guards, Machinery Guards; Elevator Enclosures, Wickets and Grilles; Railings for Stairs, Porches, Balconies and Windows; Area Gratings and Sidewalk Doors; Wire Signs.

Complete catalogue sent on request.

Important Recommendation to Architects

It is suggested that architects secure our quotation direct. Copies thereof will be gladly furnished to contractors when this work is to be included in another contract. To be protected against inferior service and workmanship, the architect should include in his specifications:

"As made by the ACORN WIRE AND IRON WORKS, Chicago, *or equal.*"

Acorn Wire Mesh Enclosure Panels

A fireproof partition which allows free circulation of air and unobstructed light is a requisite for every industrial plant.

Acorn enclosure panels give systematic effectiveness—the aim of every factory executive; they eliminate loss of tools and supplies, and do away with petty thievery.

They are 100% interchangeable. They can be rearranged, added to or moved quickly and by inexperienced workmen. They permit the forming of a corner at any intersection and the placing of doors between any two panels.

Material Specifications—***Height***—7, 8, 9 and 10 ft. carried in stock; other heights to order. Can also be increased to any height by adding special panels at top.

Width of Panels—Standard panels are 5 ft. wide. This extra width is used to eliminate the weakness caused by too many connections. It also saves from 15% to 20% installation cost. Special width panels furnished to fill in where necessary.

Cut-outs and Special Panels—Cut-outs, or special size or shape panels furnished to meet special conditions.

Door Sections—Standard door sections are 3 ft., 3 ft. 6 in., and 4 ft. wide, and of height to match partitions. Doors are 6 ft. 6 in. high with transom panel overhead. Door sections interchangeable with other sections. Either sliding or swinging types furnished. Sliding doors up to 4 ft. wide made self-closing without extra cost. Special sizes when necessary.

Locks—Made of brass, operated with pin tumbler cylinders from outside, and recessed knob from inside. Master-keyed locks furnished at slight additional cost. Doors equipped with hasp for padlock instead of regular lock with reduction in cost.

Combination Service Window and Shelf—Shelf swings up, closing opening, and is locked from inside with improved dead locking push bolt. 2 sizes: "A," 15 in. wide, 9 in. high; "B," 24 in. wide, 15 in. high. Each fitted with metal shelf extending about 2 in. on outside, and 9 and 15 in., respectively, on inside. Special service windows furnished to suit requirements.

Hangers—All sliding doors equipped with ball bearing hangers.

Wire, Web and Mesh—No. 10 (⅛-in.) open hearth steel wire used. Entire web in one piece with wires passing through center stiffening bar, eliminating unnecessary joints. Mesh is 1⅝-in. diamond mesh.

Framing and Stiffening Bar—Framing, 1x½-in. steel channel. Center stiffening bar, 1x⅜-in. steel channel securely riveted to frame.

Capping Bar—2x$\frac{3}{16}$-in. steel channel extending from center of one panel to center of next, thereby breaking joints.

Bracing—While capping bars will carry a reasonably long partition, simple methods of bracing can be effected by use of wire strands from top of partition slantwise to ceiling.

Floor Sockets—2½ in. high to allow for adjustment where floors are uneven.

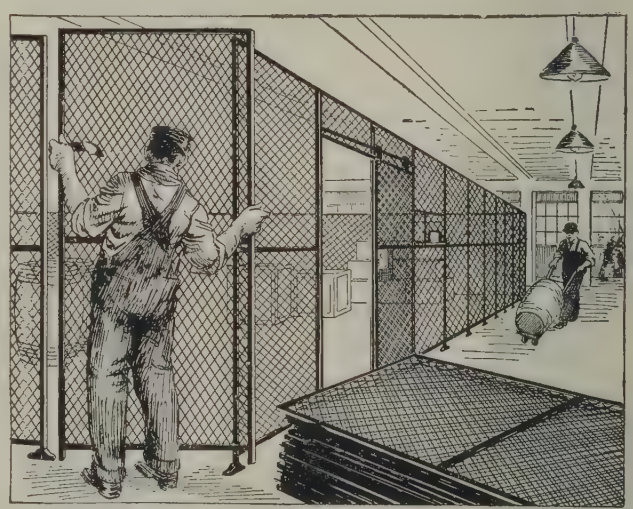
Corner Posts—1x1-in. steel angle with floor socket. This permits the making of corner at any intersection.

Connecting Toggles—In addition to the regular bolts furnished for bolting panels together, 3 special toggles are furnished at each intersection to prevent channels from telescoping or overlapping, thereby overcoming the difficulty otherwise experienced in erection.

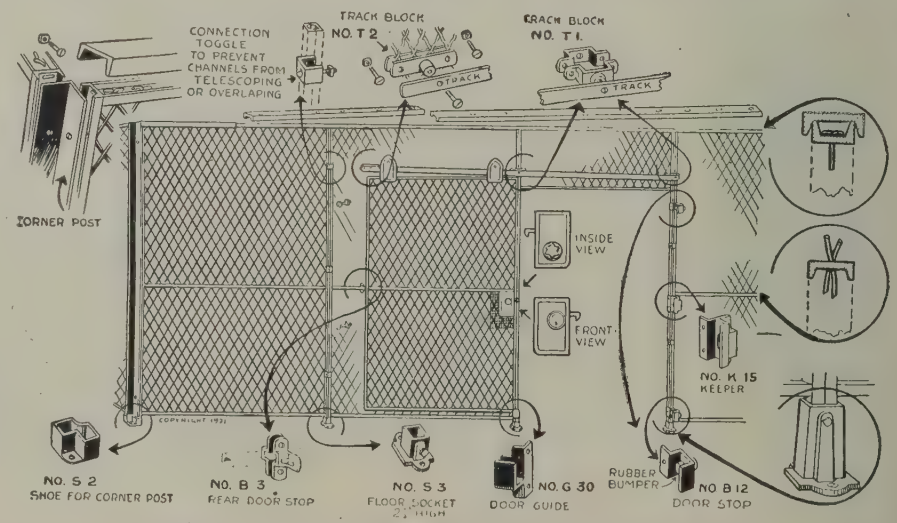
General Hardware—All hardware that is subject to strain is made of malleable iron or wrought steel to prevent breaking. The balance is made of soft gray iron.

Paint—Standard factory green unless otherwise specified. Special colors may be had at slight additional cost.

Erection—Many original and exclusive features make Acorn partitions extremely easy to erect. No experience or special skill is necessary. Diagram and complete setting instructions sent with each order.



Acorn Unit Wire Mesh Enclosure Panels



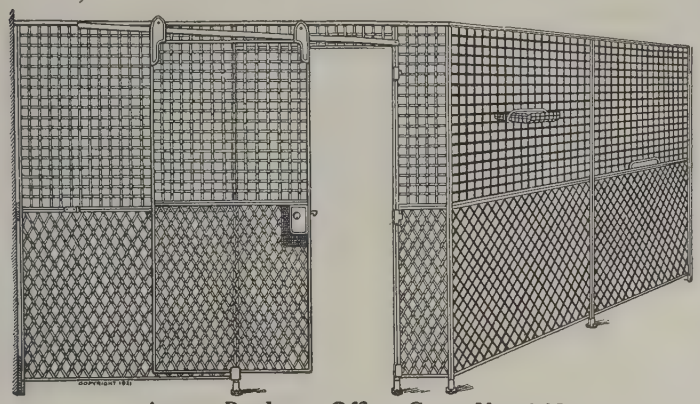
Details of Acorn Unit Sectional Diamond Mesh Partitions

Continued on next page

Cages for Banks, Offices, etc.

The Acorn Wire and Iron Works have developed and are using the press crimp type of construction in bank and office cages (see detail). This type of crimp adds much to the character and distinctiveness of the work. The old type double crimp can still be furnished when it is necessary to match old work.

Press crimp can be furnished in either square or flat wire, but because of its greater utility and rigidity, square wire is recommended (see typical specification below).

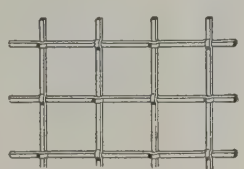


Acorn Bank or Office Cage No. 142

No. 142 cage is commonly used in offices and small banks.

The upper part is made either of ⅛-in. square wire or ¼-in. flat wire, 1½-in. square mesh. The ⅛-in. square wire is preferable because of its greater strength. Wires are pressed at each intersection, making a neat and pleasing appearance. The lower part is made of round wire, 1½-in. diamond mesh.

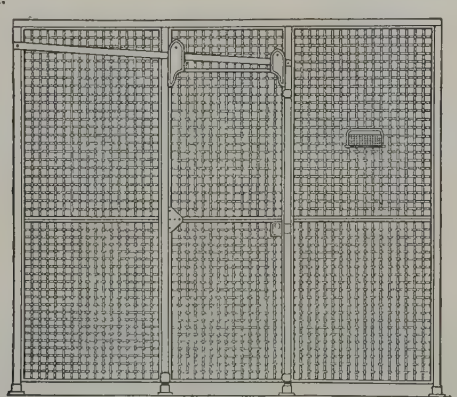
Doors furnished either sliding or swinging type; sliding doors being made self-closing unless otherwise specified. Doors fitted with cylinder locks operating with key from outside and knob from inside.



Detail of Press Crimp Construction

Typical Specifications—Cages shall be of a height to conform to front fixture and shall be made of ⅛-in. square wire, 1½-in. square mesh of press crimped type. Framing to be of 1x½-in. channel, tenoned and riveted at corners. Posts at doors and at each intersection shall be of 1¼-in. square Shelby tubing No. 14 gage in thickness. The same tubing shall be used to finish top of cages. (See Design No. 144, Catalogue 201, Acorn Wire and Iron Works, Chicago.)

Note: If flat wire is specified, ¼x⅛-in. wire, 1½-in. square mesh is recommended.



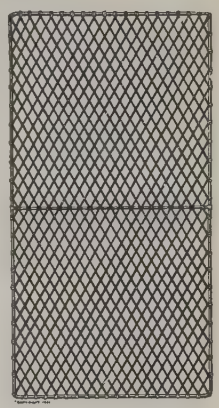
Acorn Bank Cage Design No. 144

Doors to be of sliding gravity, self-closing type hung on ball bearing hangers and fitted with Yale master-keyed cylinders; master keys to be of series different from balance of building.

Pass baskets 8 in. wide, 10 in. long shall be included for each division. Pass baskets 8x8 in. shall be included for the rear of each cage. Basket to be fitted flush with outside of cage.

Acorn Diamond Mesh Window Guards

They permit the opening of windows for ventilation without danger of burglary or damage to material or tools, and safeguard windows against accidental or intentional breaking.

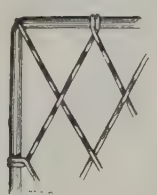


No. 121. Window Guard

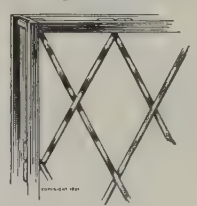
Material Specifications—Made of three principal specifications: 1¼-in. mesh, No. 12 wire; 1½-in. mesh, No. 10 wire; 2-in. mesh, No. 8 wire. The 1½-in. mesh, No. 10 wire is most used, being the meeting point of burglary and glass protection. Guards can be furnished in any wire or mesh desired.

No. H-5 hinge and No. H-6 hasp, of malleable iron, are recommended. They afford an excellent means of fastening and are adaptable to any style window frame by reversing same where necessary. Hinges are fastened to window by lag screws making it difficult to remove from outside. Hasps are locked to a heavy screweye which can not be removed when padlock is in place.

H-5 Hinge and H-6 Hasp



No. 121



No. 122

Details Showing Construction of Screens

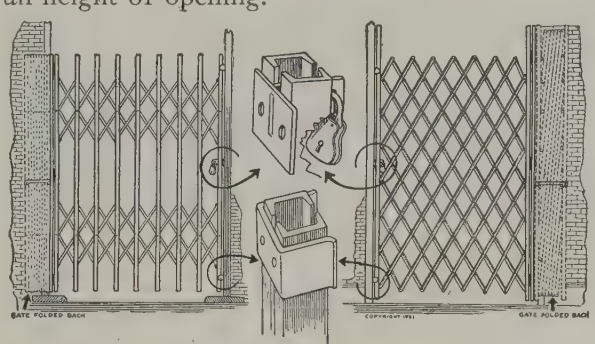
No. 121 guard has round steel frame of ⅛ or ⅜-in. diameter according to size of guard. Furnished in either stationary or hinged type. Hinged type permits washing windows.

No. 122 guard has channel frame varying from ¾ to 1 in. wide. These are satisfactory when designed to fit opening, but are not recommended when outer grooved edge is exposed to view.

Collapsible Folding Gates

These gates form an excellent means of closing off doorways and other openings. They offer protection without interfering with light or air, and when not in use they may be folded back out of the way.

When ordering, give measurement of full width of the opening the gate is to occupy. Always give height of gate from floor. It is also well to give measurement of full height of opening.

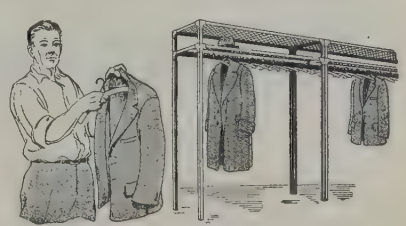


No. 157. Folding Gate **No. 156. Folding Gate**

Note: Gate No. 156 increases in height at the ratio of 1½ in. to each foot in height when gate is folded together. When measuring, be sure that sufficient head clearance is available to take care of additional height. Gate No. 157 remains the same height whether open or closed.

Sani-Robe—The Sanitary Coat and Hat Rack

A sensible, practical, and sanitary coat and hat rack. Made of steel framing with wire mesh shelves. Units are 5 ft. long, 18 in. deep, and 74 in. high. Each provides for 10 garment hangers.



The Sani-Robe

BADGER WIRE & IRON WORKS

1210-1226 25th Avenue

MILWAUKEE, WIS.

Products

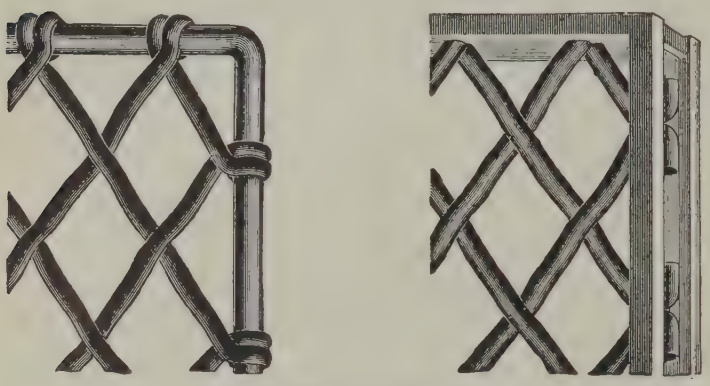
ORNAMENTAL IRON AND WIRE WORK:

Window Guards, Wire Partitions, Railings, Tool Room Enclosures, Fences, Grilles, Panels, Wire Signs, Skylight Guards, Iron Gratings, Folding Gates, Balcony Railings, Sidewalk Doors, Marquises, Fire Escapes, Iron Stairs, Elevator Enclosures, Fireproof Stairway Enclosures, Entrance Gates, Flagpoles and Lawn Furniture.

Service

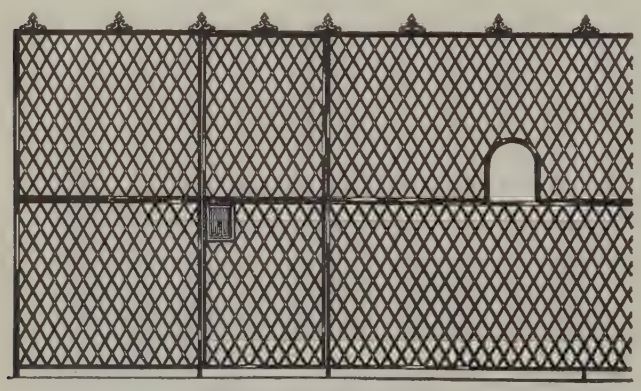
Ornamental iron and wire work according to design to be submitted, or this Company will furnish details of their standard construction. Inquiries will be given prompt and careful attention.

BADGER WIRE & IRON WORKS own and operate a new plant, where, with ample space and facilities, they will be able to give prompt and satisfactory service.



Wire Window Guards

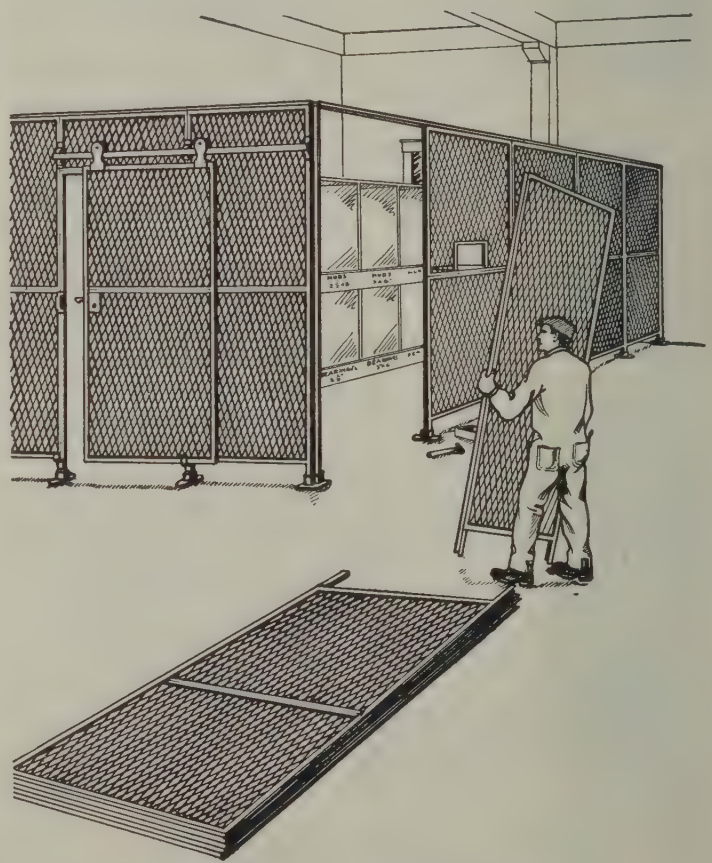
A particular specialty is made of the manufacture of wire window guards and these can be furnished at minimum prices. Inquiries should specify quantities and sizes, as well as gauge of wire, size of mesh and style of frame



Wire Partition

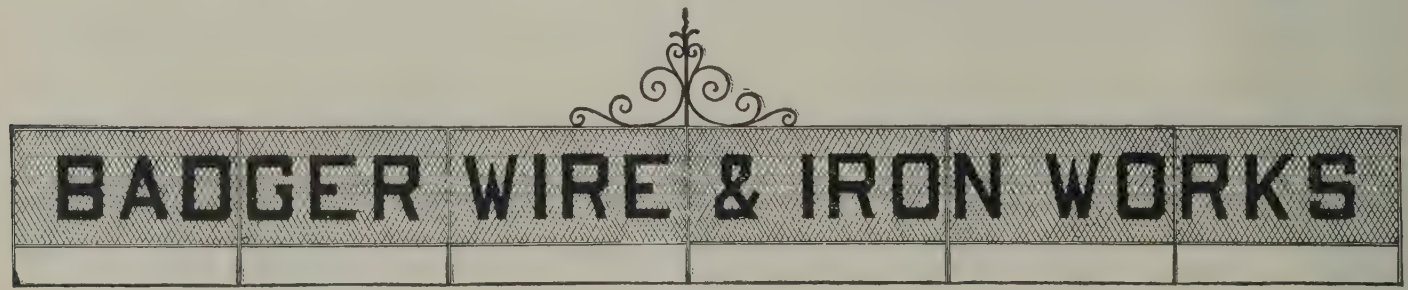
Used extensively where it is desirable to enclose a space effectively without obstructing the light.

Generally made of No. 10 wire, 1½-in. diamond mesh, 1x½x⅛-in. channel frames; cover bar and cast pickets at top as shown



Standard Sectional Wire Partitions

Principally for tool and stock room enclosures. Interchangeable, so that re-arrangement is possible without drilling or fitting. Standard partitions are made 4x7, 5x7, 4x8, and 5x8 ft. They are made of No. 10 wire, 1½-in. diamond mesh, 1x½x⅛-in. channel frames, horizontal bar through center, 1½-in. channel cover bar at top; swinging or sliding doors; also service windows, equipped with necessary hardware



Wire Sign

A specialty is made of the manufacture of wire signs and BADGER WIRE & IRON WORKS have furnished some of the largest in use. In writing for price state length, height and lettering wanted, also the position of the sign so that the proper bracing may be figured. Complete specifications will be submitted in quoting

General Wire Work, Especially Bank Wire Work Equipped with No-Track Door Hangers

30 Church Street
NEW YORK, N. Y.

Products

General Wire Work of Brass, Bronze and Iron such as Store Room Enclosures, Stock Room Partitions, Window Guards and particularly Bank Wire Work equipped with No-Track Door Hanger.

Experience

We have been in the wire work business for over 30 years and can refer to leading architects and contractors.

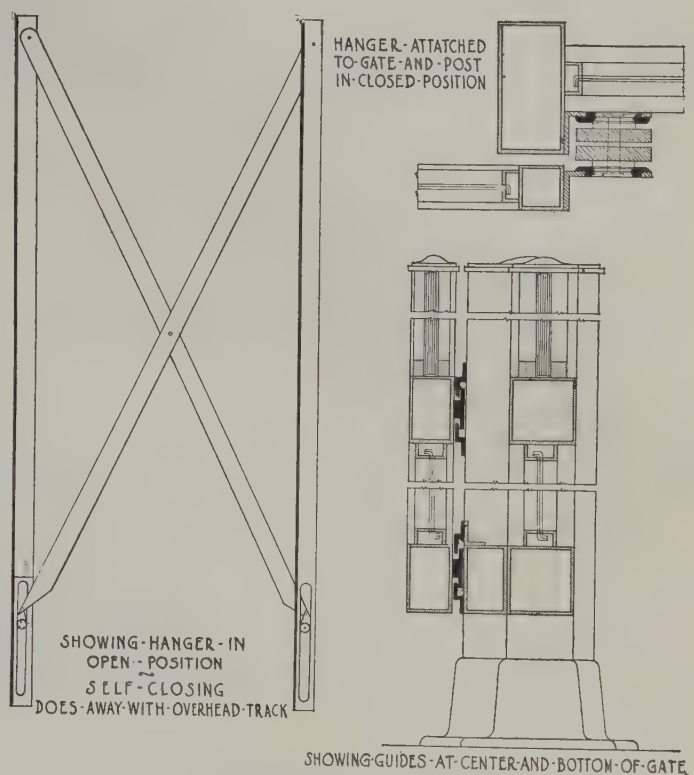
Bank Cage Work a Specialty

We specialize in cage work for banks. We solicit an opportunity to estimate.

No-Track Door Hanger (Patented May 7, 1919 and Feb. 16, 1920)

A new product that does away with the top track of the low type of bank cage work. It is the only thing of its kind in the market. It is self-closing, noiseless, vibrationless and positive in action. Posts cannot be loosened by action of the hanger and there is no cracking of glass. It holds the door firm and rigid up against the posts. When the door is closed the hanger is invisible. See illustration below.

Made for any height door.

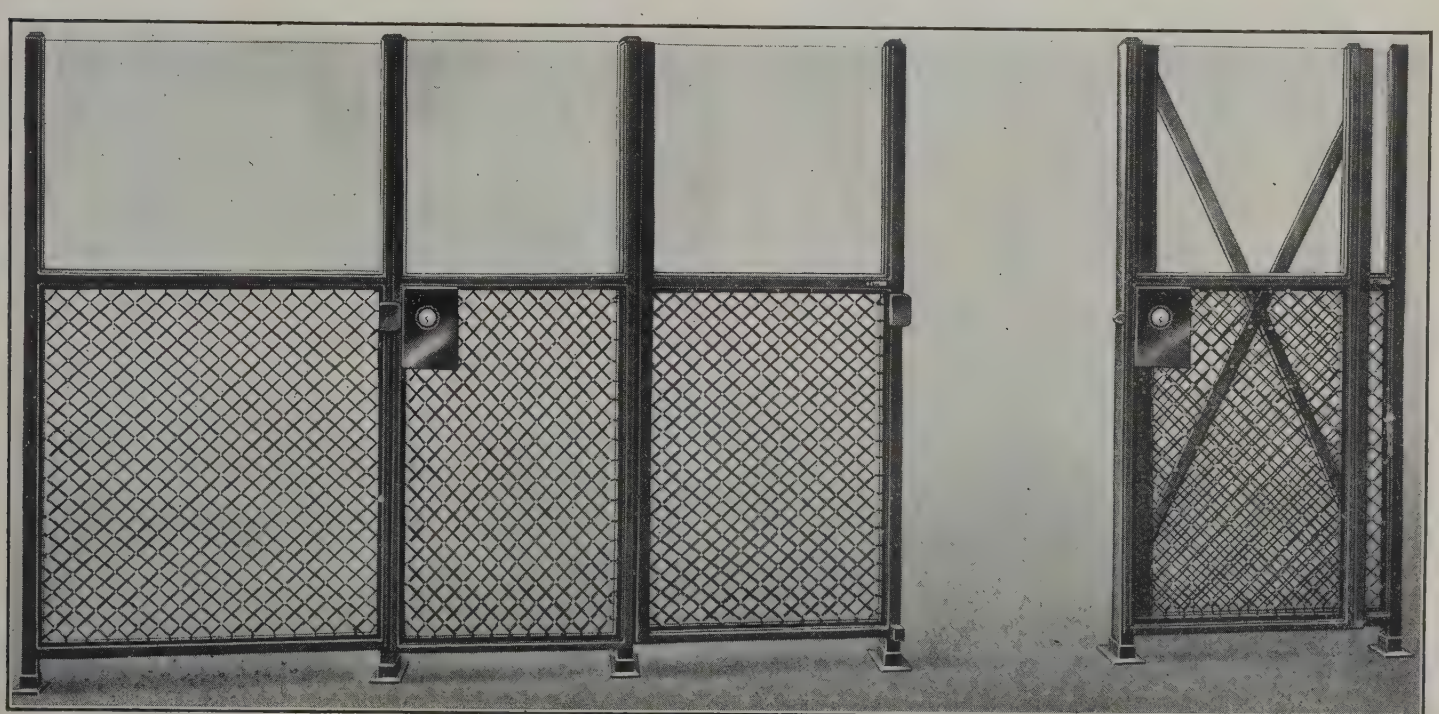


Details of the No-Track Door Hanger

A Few Recent Wire Work Installations

We recently installed the wire work in the following New York, N. Y., banks and trust companies:

Equitable Trust Co.
Bank of the United States.
Liberty National Bank
Chatham & Phenix National Bank
American Exchange Irving Trust Co.
Public National Bank
Farmers Loan & Trust Co.
Staten Island Savings Bank
Bank of Hawaii



Door Closed — Door Open

No-Track Door Hanger (Patented) for Sliding Doors in Low Type Cage Work, Installed in Chemical National Bank, 165 Broadway, New York, N. Y.

THE COLUMBUS WIRE & IRON WORKS CO.

Ornamental and Architectural Wire and Iron Work

MAIN OFFICE AND PLANT
Poplar and Michigan Avenues
COLUMBUS, OHIO

Products

ORNAMENTAL and MISCELLANEOUS IRON and WIRE WORK: including Stair, Balcony and Porch Railings; Grilles; Wire and Iron Window Guards; Entrance Doors and Gates; Steel Folding Gates; Bank Screens; Spiral Stairs; Fire Escapes; Pipe Railings; Area Gratings; Columbus Standard Wire Partitions; Wire Signs; Skylight Guards; Cold Air Screens; Flagpoles, Flag Stands; and many other Light Steel and Wire Products.

We are craftsmen in wrought iron.

Facilities

We will gladly submit designs and specifications for special work. We also furnish estimates on architects' plans and specifications, giving complete estimate on all work required for entire building as covered by ornamental iron specifications.

Our plant covers 22,000 sq. ft. of floor space and is equipped with best of modern metal working machinery. We employ mechanics of long experience.

Wrought Iron Railings from Stock

Send for circular showing railings, panels and posts which we can furnish from stock at prices more reasonable than many designs in wood.

Specify iron rails for porches on residences and apartments. They are neat and durable, and easy to erect.

Additional Plates of Stock Designs

For additional plates of our stock designs, refer to your files under "Ornamental Iron and Wire Work," A.I.A.-15d.

"Garcy" Metal Work Combines Beauty with Permanent Utility

Every installation of "Garcy" metal work, whether in banks, department stores or offices, reflects credit upon the excellence of our grilles and wickets both from the standpoint of beauty as well as strength.

Many of these installations have been in for many years and retain the same luster now that they did the day they were installed—for "Garcy" grilles and wickets will not rust or tarnish.

While offering the utmost in strength and utility, our grilles and wickets show those fine points of expert craftsmanship that add the distinctive dignity so essential to the institution in which they are installed.

Only the very best material of suitable durability and wearing qualities enters into the manufacture of "Garcy" grilles and wickets to safeguard your investment and the "Garcy" reputation.

Folding Gates and Guards a Specialty

This company is the original manufacturer of the "Bostwick" gate, and the originator of most of the standard folding gates, developing their uses through specialization.

This department is therefore, by training, experience and facilities, prepared to meet the demands of architects, builders and the iron trade.

"Pitt" gates are internationally famous for their quality, and are found in every state and many foreign countries.

The initial cost is not high. They are strong, durable and easy working and take up very little space when not in use.

Quality of Work

Every "Pitt" product is of the highest grade workmanship and materials, economically produced under modern conditions.

ESTABLISHED OVER 25 YEARS

L. E. JONES, Prop.

L. E. JONES WIRE & IRON WORKS

321 North Calvert Street
PLANT 318-322 DAVIS STREET
BALTIMORE, MD.

Products

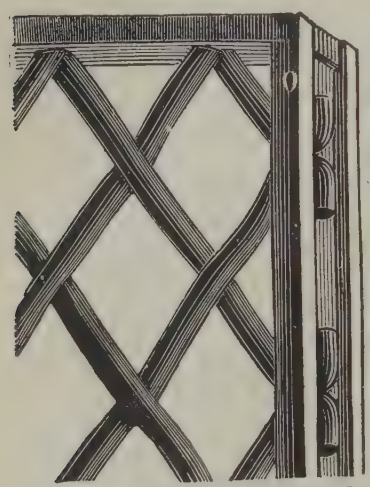
ORNAMENTAL IRON and WIRE WORK: including Window Guards, Elevator Enclosures, Grilles, Folding Gates, Elevator Cars, Sieves, Sand and Coal Screens, Machine Guards, Wire Partitions, Railings, Iron Gratings, Sidewalk Doors, Fire Escapes, Railings and Entrance Gates.

Also Fine Mesh Wire Cloth, Diamond Mesh Fabric, Galvanized Wire Mesh Cloth and Steel Stack Netting.

Facilities and Service

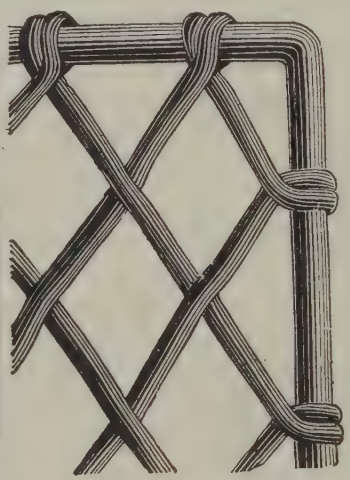
Our plant is fully equipped with facilities to handle any type of ornamental iron work. Our service is prompt and satisfactory.

We are prepared to work up any special designs submitted to us or will be glad to offer our own suggestions when desired. Inquiries are given prompt and careful attention. We have a number of special catalogues covering the various types of work which will be sent on request.



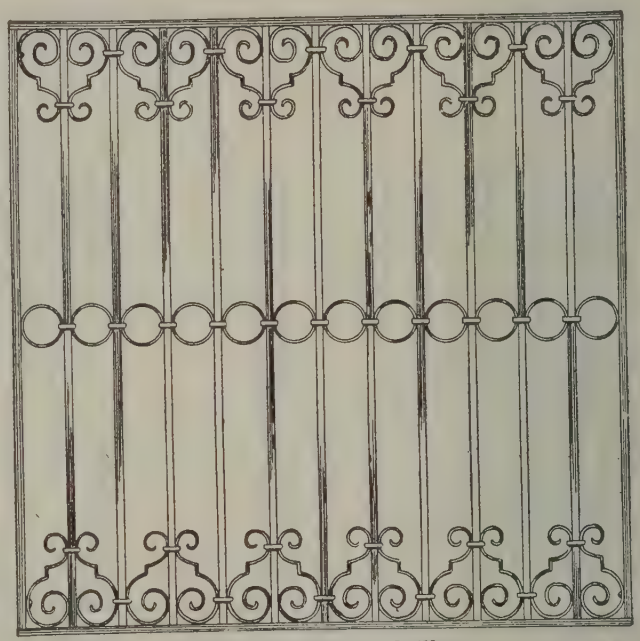
No. 25 Wire Window Guards

These guards are made with channel iron frames. They are strong and substantial, and made to screw in the window jamb, but can also be made to fasten to the outside of frame if so desired



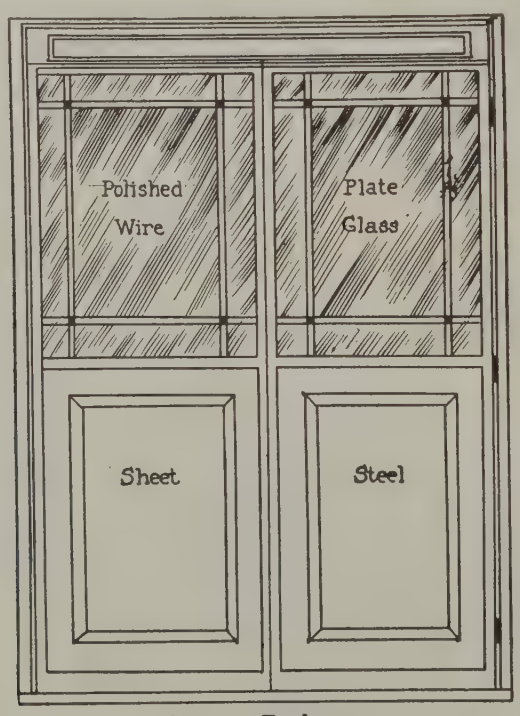
No. 26 Wire Window Guards

This type of inexpensive guard is usually fastened with staples, but they can be furnished with lugs for screw attachment if required.



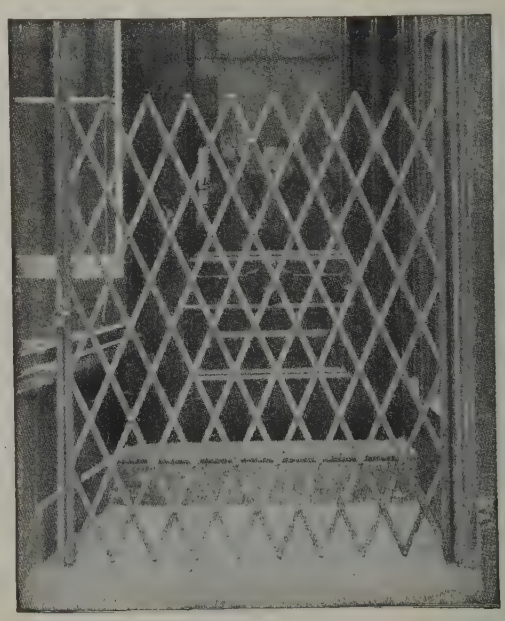
Bank and Office Grilles

Made of iron, steel, brass, bronze and oxidized copper and in any finish. Plain flat grilles, with or without frames for sundry purposes to the more elaborate ornamental types for office, banks, etc. Made to designs submitted to us or specially designed to harmonize with other fixtures



Elevator Enclosures

We make a specialty of all types of elevator enclosures and have equipped some of the largest office buildings in this field. Your inquiries for this class of work are solicited. A special catalogue will be sent on request



Folding Gates

All types and sizes of folding gates. Can be made to fit any opening. For store, factory, elevators, passageways and office entrances, as well as for other miscellaneous uses.

Steel and Bronze Folding Gates

We have developed an improved vertical bar type of folding gate which is especially suited for school hall corridors and extra wide openings and public spaces.

Fig. 1 shows half elevation of gate both extended and collapsed, also detail of wall connections, locking arrangement and top track. Bottom track is similar. Note compactness of gate and top and bottom tracks when gate is collapsed. Gates are hinged to allow same to swing back against wall or into recess, whichever is desired. Angle hinge bars run from floor to ceiling

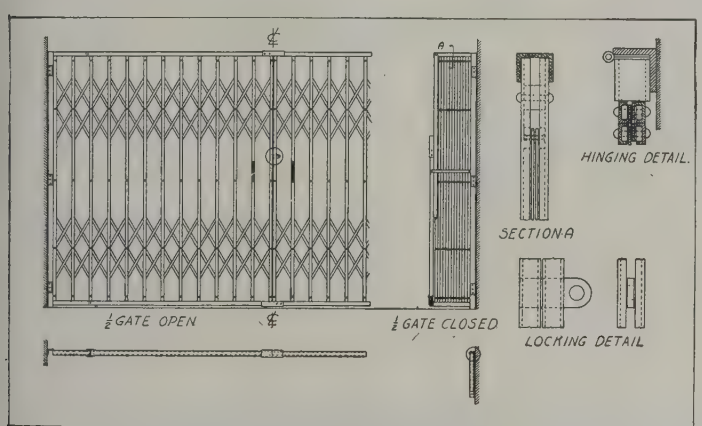

Fig. 1

affording secure anchorage. Top and bottom tracks insure excellent rigidity and prevent swaying when gates are open. Widths up to 22 ft. can be accommodated. Heights up to 7 ft.

Gates can be furnished made of steel, brass or bronze with steel or bronze tracks.

One man can operate gates with ease.

We also manufacture diamond lattice folding gates made of either flat bars or channels.

Construction—Vertical bars consist of two ¾x⅜x⅛-in. channels, riveted together with cast iron separator blocks between. Lattice bars are ⅝x⅛ in.; top and bottom tracks are 1¼x1x⅛-in. channels and hinge bars are 1½x1½x¼-in. angles.

Specification for Folding Gates—Furnish and install double hinged vertical bar type folding gates with folding top and bottom tracks, as manufactured by WESTERN WIRE & IRON WORKS, INC., Chicago, Ill., or equal. Vertical bars to consist of double ¾-in. channels spaced not more than 5 in. o.c. when open. Hinge bars must be securely anchored. Gates to be made of bronze throughout, including bronze top and bottom tracks, and to be polished and lacquered. (Specify steel or bronze for gates or tracks, whichever is desired.) Leave all gates in first class working order.

Wire Mesh Skylight Guards

We present herewith a practical construction of wire mesh skylight guards for ventilated skylights which reduces to a minimum danger of early corrosion usually caused by allowing places for moisture to accumulate.

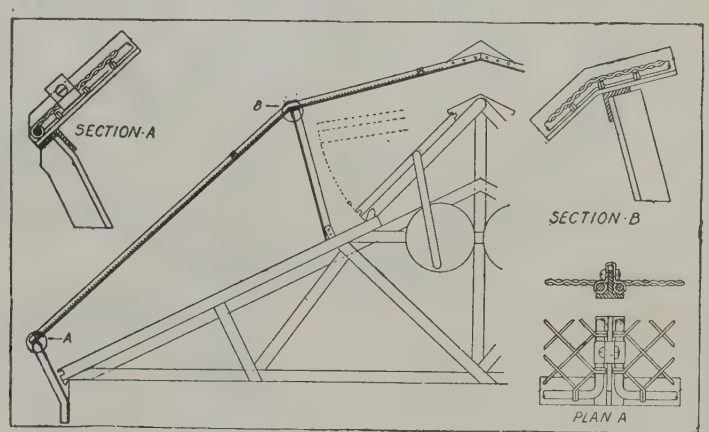

Fig. 2

By referring to Fig. 2 you will notice that supporting angles and tees are placed so that no moisture may collect. Guards are made with ⅜-in. round frames, securely bolted to tees by means of clips which make guards easily removable for repainting and give access to all points.

Be sure to specify whether guards and framework are to be made steel painted, galvanized material, galvanized material painted, hot galvanized after, cadmium plated or bronze wire and frames on painted steel framework. For an enduring job, bronze throughout is recommended.

Specification for Skylight Guards—Furnish over all skylights wire mesh guards made of 1-in. diagonal mesh No. 12 W&M gauge wire with ⅜-in. round rod frames. Weld stiffening rods through center of guards containing over 20 sq. ft. No panel to be larger than 5x8 ft. All guards to be supported on 1¼x1¼x$\frac{3}{16}$-in. angle and tee iron supporting framework as detailed, held not less than 8 in. from glass by means of 1½-in. angle struts at ends and sides and 2x$\frac{3}{16}$-in. flat bar standards over skylight, bolted to lugs placed in skylight construction by skylight contractor. All as made by WESTERN WIRE & IRON WORKS, INC., Chicago, Ill., or equal.

Specific Information

Complete information, including estimates and preliminary designs for any of the products illustrated, or listed under products, will be promptly supplied on request.

Catalogue sent on application.

Service to Architects and Engineers

We offer to architects and engineers the service of our Engineering Department to advise with them or aid them in any railing problem or in any other problem involving the use of pipe and fittings in construction work.

We Manufacture and Erect Complete Pipe and Bridge Railings

It is not our policy to furnish fittings alone.

For over 25 years we have been manufacturing and erecting pipe railings and bridge railings in all localities.

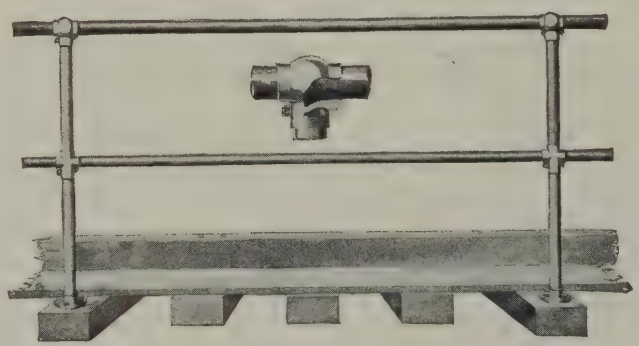
We design railings for any purpose or make them up from architect's specifications.

In many cases these railings are made entirely of pipe and fittings, whereas in other instances they are made of a combination of pipe with bars or other structural shapes.

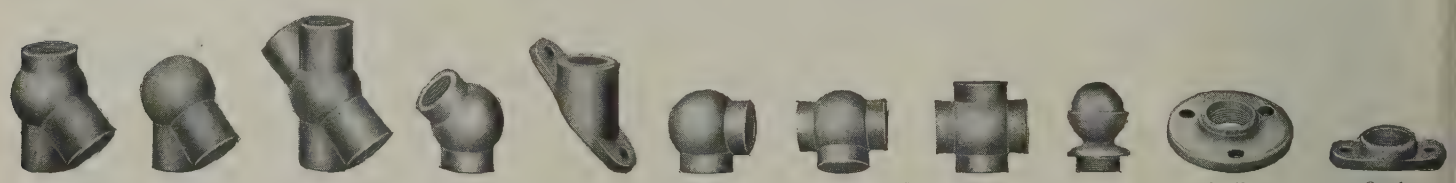
Facilities

Our main plant at Maspeth, N. Y., and branch shops at Pittsburgh, Pa., are both fully equipped to manufacture railing products, having a trained force of skilled and experienced workmen, which insures prompt and efficient execution of all orders.

Both plants are located on main line railroads and have private sidings.



Elevated Railroad Railing Constructed with Special Malleable Iron Fittings Equipped with "Vulcan" Anti-rattler Wedges to Prevent Loosening of Railing Due to Vibration of Structure



"Vulcan" Standard Railing Fittings

Boardwalk Railing with Lamp Posts

Typical Bridge Railing

Continued on next page

In the railings made solely of pipe and fittings a great variety of conditions can be met and a varied effect can be produced by the use of different types of posts. Some of these different posts are indicated on the following page.

A few different types of railings suitable for use on bridges and approaches and made of pipe and steel shapes are indicated on second page following.

We are, as our name states, a pipe rail manufacturer and a construction company. We will undertake the complete design, manufacture, fabrication and erection of any pipe railing job. We will guarantee that all materials will be as specified, and that the finished job will be the highest quality possible in pipe railings, as regards fit and erection. In addition, all work is guaranteed to give the service for which it is installed.

Contracts executed in any part of the United States or Canada.

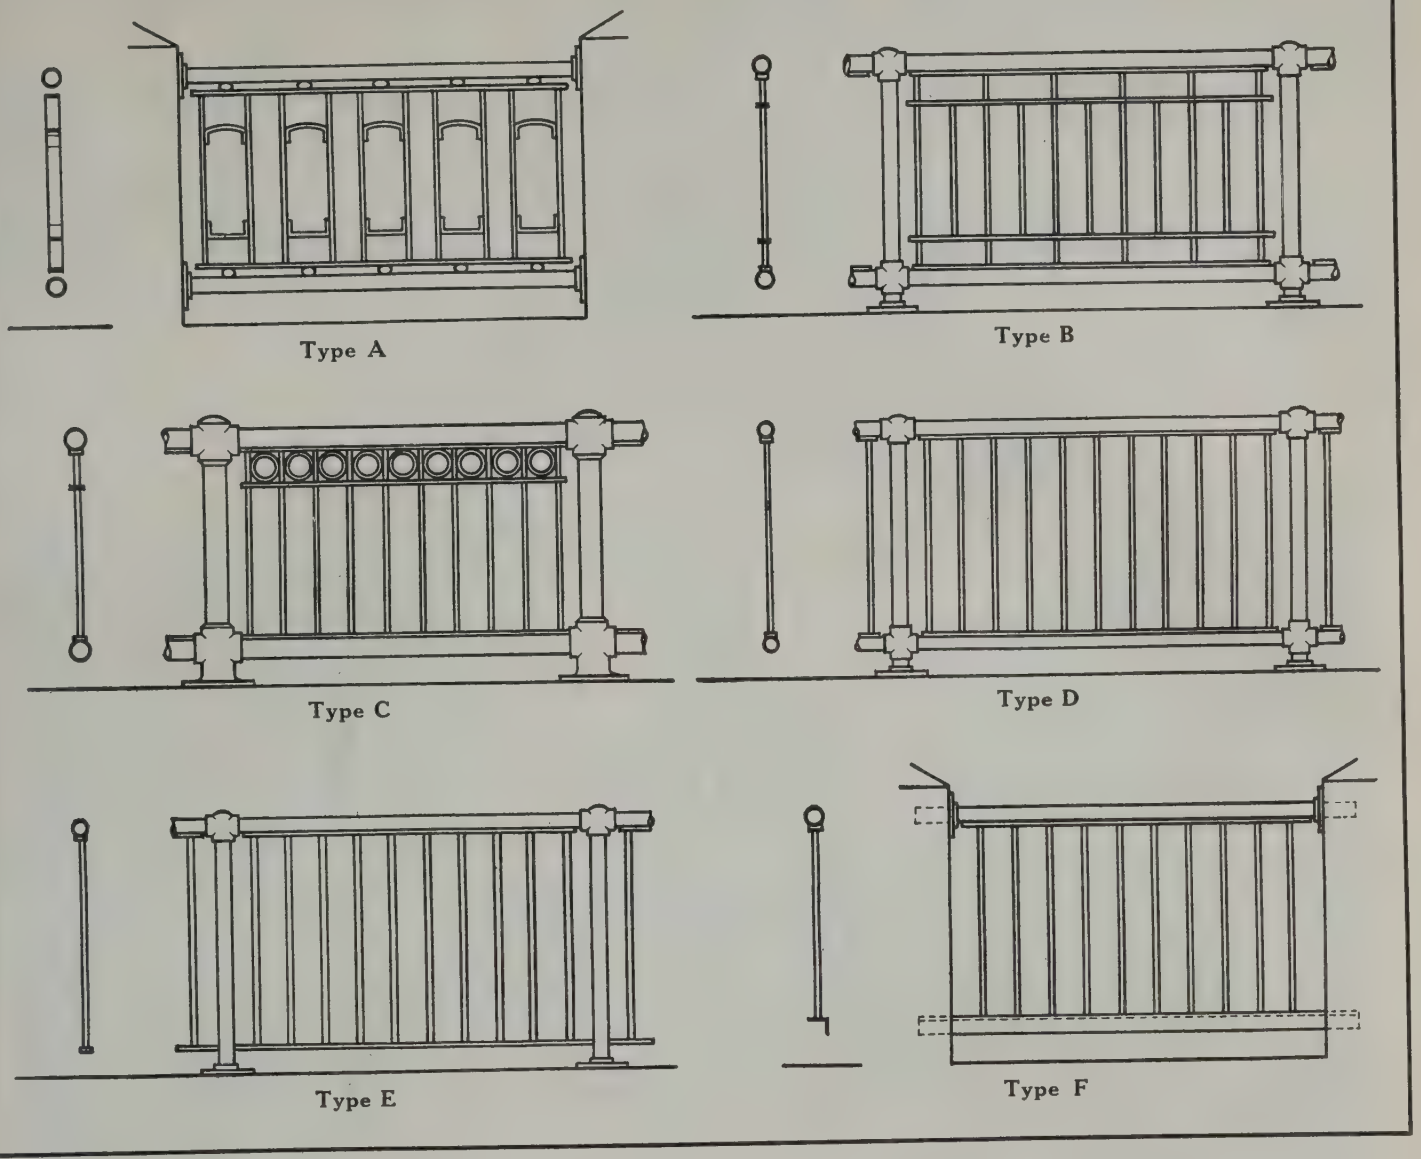
Typical Railing Posts Made with Pipe and Standard "Vulcan" Fittings

Shown above is a group of posts of the types most frequently used in the construction of pipe railing. Although these sketches show posts for one, two and three horizontal rails, the two-line railing is most generally used. However, railing can be made with any number of horizontal rails.

Fig. 1. Level end posts.
Fig. 2. Level line posts.
Fig. 3. Level corner posts (note plan of post).
Fig. 4. Stair landings or platform posts (similar to illustration on our first page).
Fig. 5. Stair starting and landing posts.
Fig. 6. Stair line posts (similar to illustration on our first page).
Fig. 7. Stair landing posts (with side outlets, right or left).
Fig. 8. Stair landing posts where the railings continue level.

Railings with any of the above posts and many others can be quickly made up from the large stock of Standard "Vulcan" Pipe and Fittings continually on hand.

Continued on next page



Various Types of "Vulcan" Bridge Railings

To attempt to show in a small space any considerable number of bridge railing designs is practically impossible, as the various combinations that can be made by the use of pipe, fittings, bars (square and round), flats, channels, angles, etc., is well-nigh inexhaustible.

The designs shown above vary from that in which square or round rods are used for the pickets with a channel top-bar directly under the pipe, and a bar or channel for the bottom member, to more elaborate designs using cast iron posts and introducing rings and other shapes into the railing panels.

Special designs to suit architects' and engineers' requirements will be submitted on request.

Queensborough Bridge, New York, N. Y., Showing Outside Footwalk Railings

We furnished and erected 42,000 ft. of railing, also lamp posts, used along footwalks and car tracks on this bridge

Manhattan Bridge, New York, N. Y., Outside Footwalk Railing

REPRESENTATIVES IN PRINCIPAL CITIES

Fences and Gates of Standard and Special Design

This company offers a wide and complete choice of designs in standardized fences and gates both of iron picket and chain link wire types. In addition, it is prepared to execute special-design fences and ornamental iron work from architect's designs. Some of our work of this kind is pictured here.

Iron picket fences, because of the infinite possibilities of ornamental design work, are standardized only in respect to the general use of certain "plain" picket fences of the designs detailed on the following page. Ornamental work, special gates, etc., are executed in infinite variety.

Chain link wire fences, however, are a standardized product, as per specification details presented on the following page.

Catalogues, installation views, and blue prints of stock and semistandard designs of iron or wire fence are available for reference. We gladly assist in preparing specifications that enable the economical production of special designs from standard size materials.

AFCO
TRADE-MARK

Other Products

Tennis court enclosures, poultry and kennel runs, arbors and trellises, window guards, interior wire partitions and industrial property chain link fences.

An Afco Design Special Gateway

With double gates 12 ft. wide, 7 ft. high at sides, 9½ ft. high in center; and side gates 4 ft. wide, 6 ft. high. Pickets throughout are ¾ in. square and spaced approximately 5 in. apart, with scrollwork of appropriate size

Estimates and Service

Estimates on either fence materials or fences plus erection will be given, either by this office or local representatives throughout the Eastern, Central and Southern States. The fullest measure of co-operation is available.

Information regarding standard practice in the size of members, dimensions of concrete footings and other such practical data is made available to any who will find it helpful.

Fig. 7, Afco 300 Fence and Matching Double Walk Gates

Iron Picket Fences and Gates

The standard iron fences are built in varied sizes of pickets, proportionate to specified heights and the duty intended.

Standard designs can be given simple ornamentation to harmonize with the fence's architectural background, such as the row of rings in detail Fig. 10.

Special design work originates with the architect, often with the co-operation of our organization in so far as the specification is prepared to enable the utilization of members in sizes readily available.

Detail Fig. 8	Detail Fig. 9	Detail Fig. 10	Size pickets, in. square	Channel rail size, in.	Height, ft.
No.	No.	No.			
300	200	350	⅝	1½x½	3, 3½, 4, 4½, 5,
301	201	351	¾	2 x⅝	3, 3½, 4, 4½, 5, 6
302	202	.....	⅞	2 x⅝	3, 3½, 4, 4½, 5, 6

Pickets spaced on 5-in. centers.

Afco Chain Link Fences

Standardized fences in heights from 3½ to 10 ft., for the varied requirements of homes, estates, institutions, schools and playgrounds, etc. All are built with Afco Chain Link Fabric of rust-resisting *copper-bearing steel* wire, *galvanized after weaving* by a special hot dip process.

"Guardian" Fence—A medium weight structure for general use either without or with (as Style 913) barb-wire overhang.

Specification—End, corner and gate posts 2½ in.; line posts 2 in.; top rail 1⅝ in.; all outside diameter measurement, standard weight galvanized pipe. Fabric 2-in. mesh chain link of No. 6 or 9 copper-bearing steel wire. Heights, 4, 5 and 6 ft. Set with drive anchors, or in concrete post footings.

Style 913—Same as above but with 3 strands thickset barb-wire on post arms.

Fig. 8, Detail of 300 Fence

Fig. 9, Detail 200 Fence
1-in. square posts with back brace and ornamental top

Fig. 10, Detail 350 Fence
No. 16B posts, 2-in. square. Ball top

"Bulwark" Fence—A heavy weight standard for schools, institutions or extra high fences.

Specification—End, corner and gate posts 3 in.; line posts 2½ in.; top rail 1⅝ in.; all outside diameter standard weight galvanized pipe. Fabric 2-in. mesh chain link of No. 6 or 9 copper-bearing steel wire. Heights 5 to 10 ft. Set in concrete footings 36 in. deep.

Single and Double Gates

Are of rigid frame construction, being built of tubular members welded at all joints. Standard sizes for either fence, to meet all normal conditions.

Tennis Fence

Two specifications, for private, and for club and professional courts. Either complete enclosure, backstop or backstop and wings, of standard 10-ft. height or to order.

Specifications—***Private Courts***—End, corner and gate posts 2½ in.; line posts 2 in. spaced 8 ft. apart; top rail 1⅜ in.; all outside diameter measurement standard weight galvanized pipe. Fabric 1¾-in. mesh chain link of No. 11 wire. Set in concrete footings 36 in. deep.

Professional Courts—Same as above, except end, corner and gate posts 3 in., line posts 2½ in. outside diameter spaced 10 ft. apart, top rail 1⅝ in.

Afco Chain Link Factory Fence

The heaviest chain link fence, used as a non-climbable barrier where absolute protection is essential. Built on steel angle posts, with integral overhanging arm carrying 3 strands of heavy barbed wire. Set in concrete. Described fully in SWEET'S ENGINEERING CATALOGUE, or printed specification sheets can be had on request.

TRADE-MARK

Nation-wide Sales and Erecting Service

A chain of Anchor offices located in principal cities in all parts of the United States insures immediate attention to the requirements of architects. We maintain trained crews of erectors who erect fences under the supervision of our main office and branches, thus insuring good workmanship and an economical job. If desired, we will make surveys for grades and measurements and take entire charge of the work. When a customer prefers to do the erecting, tools and necessary instructions are furnished.

Estimates and Catalogues

Estimates given for products delivered and set complete in any part of the country. In requesting estimates, send, if possible, a diagram giving dimensions, location of gates, ends and corners.

For the convenience of architects and their specification writers we have prepared a special folder according to specifications for A.I.A. filing system. It contains a complete set of catalogues, specification sheets with scale drawings, details and dimensions on Anchor Fences, Railings and Gates.

The nearest Anchor office will gladly send you one of these handy folders. Just write for folder "A.I.A. File 14-K."

Surrounding residence of H. C. McCrady, Pittsburgh, Pa.

Iron Railings and Entrance Gates

Long experience enables this company to manufacture railings and ornamental gates properly proportioned and designed, and correctly made in all details. Special or stock designs furnished.

Anchor-Weld Railings and Gates

The ANCHOR POST FENCE COMPANY has secured the right to manufacture railings and gates by the *electric-weld process.* As shown in the illustrations, we use grooved square bars: ½, ⅝ and ¾ in. square. The rails consist of these bars in horizontal pairs the length of a panel. Welded between these pairs, and at right angles to them, are the pickets. All welding is done on the flange sides of rails and pickets.

The strength of this type of construction is enormous. Not only does it permit the making of panels as long as 10 ft., but the center support—so necessary with ordinary railings—is dispensed with entirely.

Even when supporting an additional weight of several hundred pounds at the center, the rails show little or no deflection. Pickets can not loosen and fall. Gates, made in the same manner as the railing, require no disfiguring diagonal braces to maintain rigidity.

Elaboration is possible: circles, scrolls, ellipses, and other special features may be introduced, double top or bottom rails may be used, and highly ornamental iron posts or brick, stone, concrete, or cast iron columns may be employed.

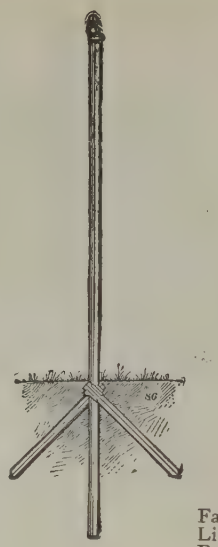
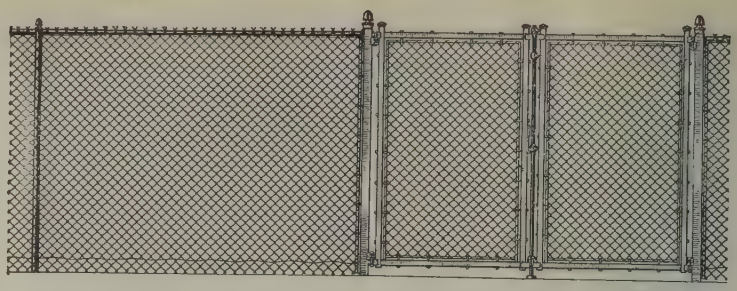
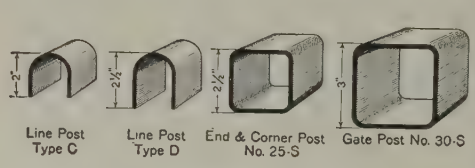
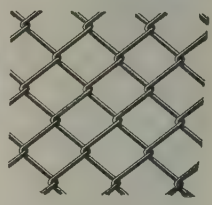
Section of Anchor-Weld Wire Gate with Anchor Square Terminal Post









Chain Link Steel Fence

Fabric.....Copper-bearing steel wire, galvanized *after* weaving
Line posts..High carbon steel, Type C or D, U-bar, spaced about 10 ft.
End, corner and single gate posts.....No. 20-S or 25-S
Double gate posts.....No. 25-S

Anchor Chain Link Fences

It is our contention that a chain link fence should be not only enduring in construction, but attractive in appearance as well. Anchor Chain Link Fences have been designed with these points in mind. Their four exclusive features—(1) high carbon steel U-bar line posts; (2) square terminal posts; (3) drive-anchorage; (4) Anchor-Weld Wire Gates—contribute materially to their exceptional strength and distinction.

Anchor Chain Link Fabric is of best quality copper-bearing steel wire, *galvanized after weaving.* Made of No. 9 and No. 6 gauge wire, the latter being more commonly used. Heights up to 10 ft. The small mesh affords no foothold for climbers and the three strands of barbed wire at the top provide an additional safeguard.

Both top rail of galvanized pipe and barbed wire topping are optional. All parts are heavily galvanized by the hot-dip spelter process.

Anchor Square Terminal Post

An exclusive Anchor feature recently introduced by this company.

Stronger—because of its square shape; unclimbable—no bands or footholds for trespassers to use as a stepladder; more protective—fabric can not be detached from post from outside; better-looking—has no disfiguring fabric-holding bands.

Anchor U-bar Intermediate Posts

These posts are made of heavily galvanized high carbon steel. Mechanical bending tests show that, weight for weight and size for size, these U-shaped posts offer a higher degree of resistance to bending strain across the line of fence than any other form of post.

Anchor Drive-Anchorage

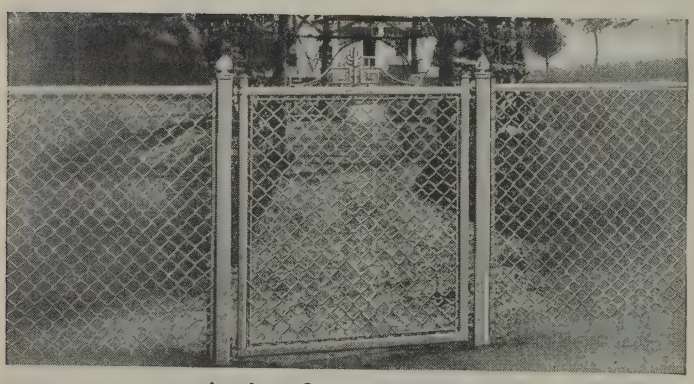
To insure permanent alignment of Anchor Fences we set the posts by our drive-anchor method, as illustrated. Neither frosts, thaws nor the heavy strains to which a fence is subjected can disturb a fence anchored by this method.

Anchor-Weld Wire Gate

The Anchor-Weld Wire Gate is the latest Anchor development. It marks an important improvement in gate construction.

For the frame of this gate we use square tubular steel, which contributes materially to the attractive appearance, strength and rigidity of the entire gate structure. The horizontal and vertical members of the frame are inseparably *butt-welded* together at the corners. So strong is this construction that no diagonal braces are needed.

Anchor-Weld Wire Gates are made in both single and double types, in a variety of widths.



Anchor Chain Link Fence
A lawn type of fence with Anchor-Weld Single Wire Walk Gate

Anchor Chain Link Fence
An installation of Anchor Chain Link Fence, including Double Anchor-Weld Wire Gate

Continued on next page

Anchor Chain Link Lawn Fence, Type AT-1

On the property of T. H. Hogsett, Cleveland Heights, Ohio.
Type AT-1 fences are made in heights of 3 ft. 7 in. and 4 ft. 1 in.

Anchor-Weld Iron Double Driveway Gate

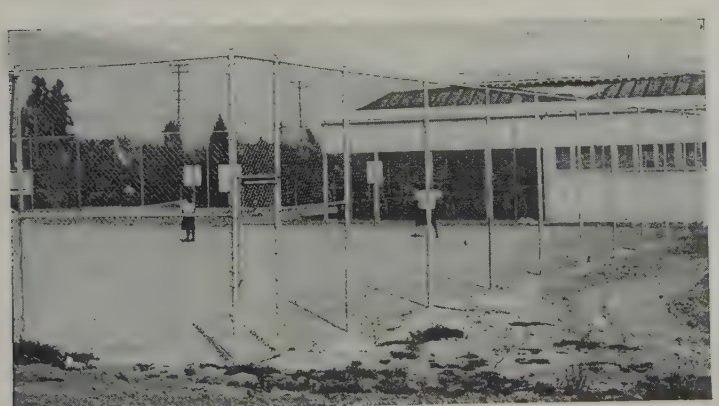
Anchor-Weld Iron Gates are made in both single and double types. Single gate opening: 3 ft. 8 in. Double gate opening: 10 ft.

Anchor Chain Link Fence, Type DO-1

Part of an installation of 2980 ft. at the Soldiers' Home, Noronton, Conn.

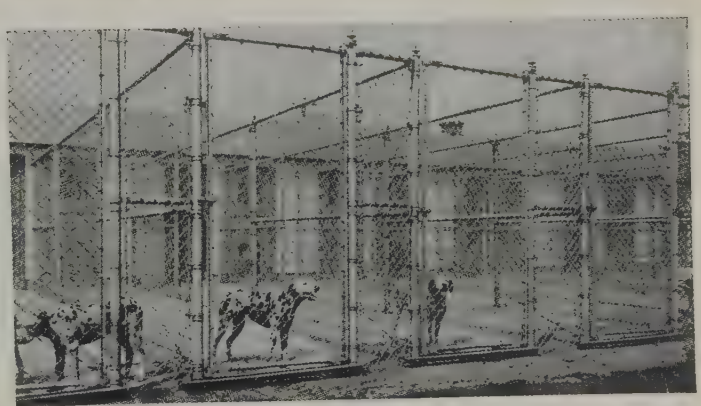
Anchor Chain Link Fence, Type DOA-1

Surrounding the estate of John D. Rockefeller, Sr., Lakewood, N. J.



Anchor Chain Link Tennis Enclosure, Type DT-1

Installed on grounds of high school, Pasadena, Cal. Built up to 12 ft. high, with adequate bracing of corners and firm anchorage. Narrow entrance gates comprised in enclosure proper



Chain Link Kennel Enclosure, Type DT-1

This kennel enclosure offers a clean runway, ample room for exercise and absolutely guards the dogs against escape, injury or theft. Can be furnished with or without covered top

Square Mesh Farm and Pasture Fence, Type CO-5

Similar to the high fence used to enclose cattle pastures.
Made in heights of 3 ft. 6 in., 4 ft., and 4 ft. 10 in. without arms or barbed wire

Chicken Run Enclosure, Type CT-4

Not only better looking but will last two or three times longer than those built with wood framework. Ratproofing is always advisable. A fine wire cloth is buried in the ground so that rats can not burrow under it; a slight charge is made for this addition.
Specification for any size enclosure can be furnished on application

ATLAS FENCE COMPANY

Protective and Ornamental Iron and Wire Fences

37 Verona Avenue, NEWARK, N. J.

Products and Service

ATLAS CHAIN LINK PROTECTIVE and ORNAMENTAL FENCING for every requirement.

Some of our Products:

Arbors	Garden Arches
Arches	Grilles
Tennis Backstops	Home Fences
Baseball Backstops	Iron Gates
Cashiers Cages	Factory Fencing
Cemetery Fences	Poultry Runs

Dog Kennels	School Fencing
Estate and Game Enclosures	Tennis Fences
	Tree Guards
Farm Fencing	Trellises
Flagpoles	Window and Skylight Guards
Flower Bed Guards	Wire Partitions and Gates
Folding Gates	Park Fences

ATLAS FENCE COMPANY engineers will be pleased to consult with you and assist in the solution of your fencing or protection problems. They will submit plans and estimates for the most economical handling of the particular difficulty. This service is, of course, without cost and without obligation. We aim to make this a real service and many times it has resulted in saving money to the prospective customer.

Catalogue and further details of any Atlas Fence will be promptly sent on request.

Construction

If a property is worth fencing, it is worth fencing well. Ordinarily fences do not last long enough. Wood fences are inadequate.

Atlas Fences are built for permanence and are not destructible by fire or vandals. Every detail is carefully planned.

Tubular Posts of High-carbon Open-seam—All intermediate posts are made of high-carbon steel (refined) stock in full weight post sections. This not only assures an exceptionally strong post but one that affords most sturdy, rigid and lasting construction. Many old installations attest to the actual fact that this quality post has stood eighteen years (and more) without painting without rusting away. In these old installations it is interesting to note that where they were used in connection with pipe (as top rail) that they far outlast any other material then used. This post is strong in every direction. Its open-seam prevents condensation and insures a dry post at all times. This tubular post makes at neat and attractive post. All posts are made to one of the most rigid specifications. They are real fence posts and are made to meet all requirements—strength, lasting qualities, and pleasing appearances.

End, Corner, and Gate Posts—Are full tubular and all full weight complete with all fittings to receive fabric. The size of post furnished depends upon the height of fence and for gate openings upon the height and width of gates. All bolts and nuts in the assembly of fittings at end, corner and gate posts are composition brass (40% zinc) and non-rusting.

Top Rail—High-carbon steel 1⅝-in. outside diameter full weight open-seam on fences 5 ft. high and over. On fences 4 ft. high (and under) 1⅜-in. outside diameter full weight open-seam top rail is used. Top rail is furnished in full random lengths connected with couplings to insure expansion and contraction. No threaded connections used. Rail passes through line post tops and clamped to end, corner and gate posts.

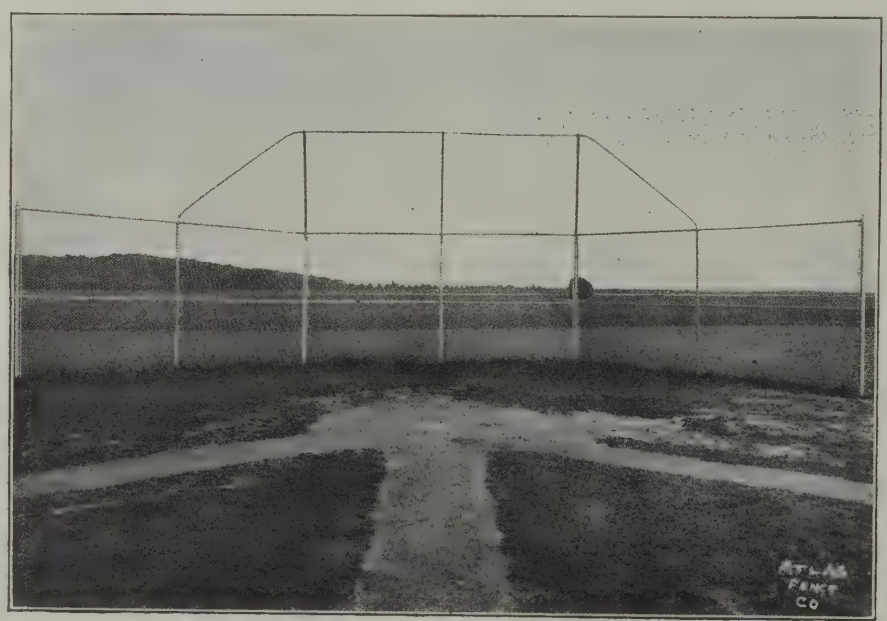
Reg. U. S. Pat. Off.

Braces—End, corner and gate posts neatly fitted with horizontal brace of 1⅝-in. outside diameter in one continuous length to first line post, complete with truss braces and all fittings.

Fabric—Chain link woven in all standard or special meshes and in Washbourne and Moen gauges with double twisted barbed top and bottom selvages for fabrics 5 ft. and over, and for lower widths one selvage is furnished with wire turned back forming smooth selvage and termed "knuckled edge." Attached with aeroplane (aluminum base) metal and non-rusting tie bands and clips.

Reinforcing Cables—A No. 6 coil spring wire cable is used along bottom selvage to which fabric is tied. Where top rail is omitted a coil spring cable of same size is substituted at the top to which fabric is tied.

Gates—Made of 2-in. outside diameter frame, with malleable gusset corners, brass riveted, and filled with fabric to match fence. Equipped with drop bolt combination double latching and locking device, and full heavy duty malleable hinges.



One of Several Backstops Furnished and Installed for the La Salle Military Academy, Oakdale, L. I., N. Y.

Galvanizing—Entire fence (except those parts of brass alloy, aluminum base, etc.) is hot-dipped galvanized.

The fabric can be furnished in two grades, "Special" and "Galvanized After." "Special" is a method of hot-dipping galvanizing wire before weaving but should not be confused with any other method of galvanizing. It is done by the Crapo method, insuring most ductile, uniform and pure zinc coated wire—a wire that can be twisted sharply without cracking or flaking of coating of zinc on wire. This result is very interestingly obtained, and is described in literature that we will be glad to send with samples to any interested inquirer.

"Galvanized After" is a method of weaving bright (ungalvanized) wire in fabric and then galvanizing by hot-dipping woven chain fabric into galvanizing bath. The result is a heavier coating but impossible to insure mechanically even coated fabric.

Concrete Foundation for Posts—All posts are set in round concrete bases composed of 1-3-4 mix. Foundations are 3 ft. deep for 3-in. posts and 4 ft. for 4-in. posts. After holes are dug the posts are set and concrete immediately poured. *Posts are then filled with cement grout to slightly above grade level.* Complete base neatly domed above grade to shed water.

Field Construction

ATLAS FENCE COMPANY maintains a field organization of expert erectors which guarantees complete satisfaction on all installation work. A fence set by them will be true to the survey line; to the grade given and correct in every particular.

Ornamental Fences

Atlas ornamental and protective fences are made in both wire and wrought iron in various styles. We will be pleased to send any further detailed literature illustrating how attractively the fence problem can be met, where both protection and ornamentation are desired. There are pleasing designs for all types of property. Wire, write or telephone us.

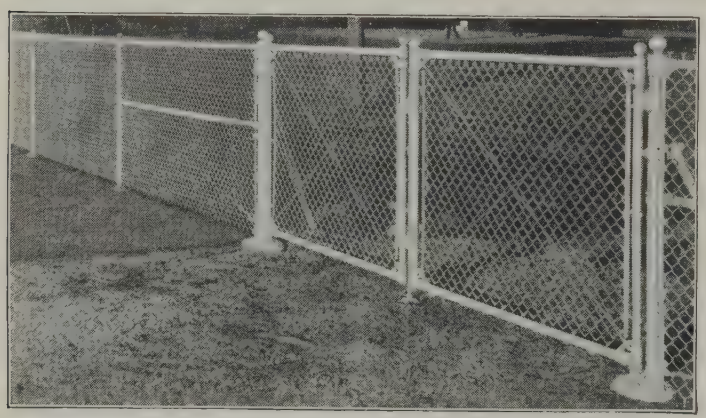
Cyclone Safeguard Chain Link Fence

Specifications—Standard height, 6 ft. Built in heights from 4 ft. up to and including 10 ft. Chain Link fabric is full height of fence.

Fabric—"Galv-After" Chain Link copper-bearing wire heavily zinc-coated (or hot-galvanized) by hot-dip process after weaving. No. 9 or No. 6 gauge wire woven in a 2-in. mesh. On heights 5 ft. and over, both edges of fabric have twisted and barbed finish. On heights 4 ft. and lower, one edge has twisted and barbed finish, the other has knuckled finish and it is recommended that the knuckled edge be placed at top of fence dressed below top rail with the barbed edge at the bottom.

Posts—Hot-dip galvanized. Of standard full weight tubular copper-bearing steel, made by the National scale-free process.

Line Posts—2½-in. outside diameter, weight 3.65 lb. per lin. ft. where fence is 6 ft. and over in height. Where fence is less than 6 ft. in height, 2-in. outside diameter, weight 2.72 lb. per lin. ft.



Cyclone Safeguard Fence

Beautiful and dignified property protection for country estates and homes—also golf grounds and clubs

End, Corner, Angle and Pull Posts—3-in. outside diameter, weight 5.79 lb. per lin. ft. where fence is 6 ft. and over in height. Where fence is less than 6 ft. in height, these posts are 2½-in. outside diameter, weight 3.65 lb. per lin. ft.

Gate Posts—The size and strength of gate posts for swinging and sliding gates have been carefully determined by our Engineering Department. Details upon request.

Post Spacing—Posts are spaced in line of fence not farther apart than 10-ft. centers.

Depth of Posts—Line posts for fence 4 ft. or lower are set 24 in. in concrete base; terminal posts 30 in. In 5-ft. fence, line posts are set 30 in., terminal posts 36 in. In Cyclone Safeguard Fence 6 ft. in height and over, all posts are set 36 in.

Post Setting—Concrete post bases are of proper mixture, size and shape to furnish a foundation and support sufficient to withstand any ordinary strain or shock. A liberal factor of safety is provided.

Post Tops—Hot-dip galvanized. All posts fitted with heavy ornamental ball post tops of malleable iron. The base of these tops fits into the post and a flange carries over the outside to cap the post against moisture.

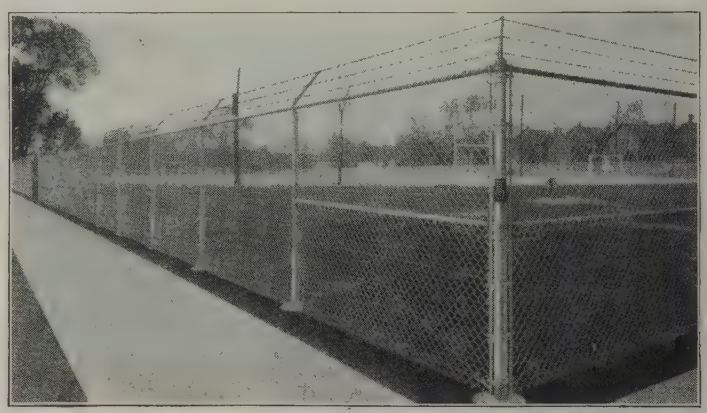
Top Rail—Made by the National scale-free process, hot-dip galvanized. Tubular copper-bearing steel 1⅝-in. outside diameter, weight 2.27 lb. per lin. ft. Provided with expansion rail coupling. Top rail passes through post tops and forms a continuous brace from end to end of each stretch of fence. Top rail is securely fastened to end, gate and corner posts by malleable iron or pressed steel connections.

Braces—Made by the National scale-free process, hot-dip galvanized. End, gate and corner posts are braced by tubular copper-bearing steel braces 1⅝-in. outside diameter, weight 2.27 lb. per lin. ft. Braces are spaced midway between the top rail and ground and extend to the first line post, fastened by malleable iron or pressed steel connections, then trussed from line post back to end, gate or corner post.

Fittings—All copper-bearing materials, hot-dip galvanized. All fittings used in connection with Cyclone Safeguard fencing and gates are malleable, wrought iron, pressed steel or aluminum.

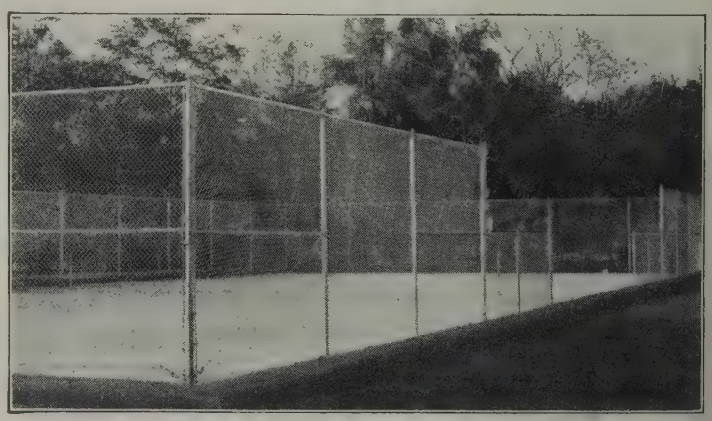
Fabric Bands—Aluminum. Fasten the fabric to line posts and top rail, spaced approximately 14 in. apart.

Finish—All materials entering into the fence construction, except aluminum bands, are heavily galvanized.



Cyclone Invincible Chain Link Fence

Standard height, 7 ft. All copper-bearing materials. Built in heights up to and including 11 ft. Fabric, "Galv-After" Chain Link, heavily zinc-coated (or hot-galvanized) by hot-dipping process after weaving. No. 9 or No. 6 gauge wire woven in a 2-in. mesh. Extension arms carry 3 rows of 4-point barbed wires, 12 in. in or out from fence line. Posts and framework, full weight tubular steel, hot-dip galvanized



Cyclone Tennis Court Enclosures and Back Stops

Framework, tubular copper-bearing steel, hot-dip galvanized. Fabric "Galv-After" Chain Link No. 11 gauge copper-bearing steel wire woven in a 1¾-in. mesh. Standard height, 10 ft.

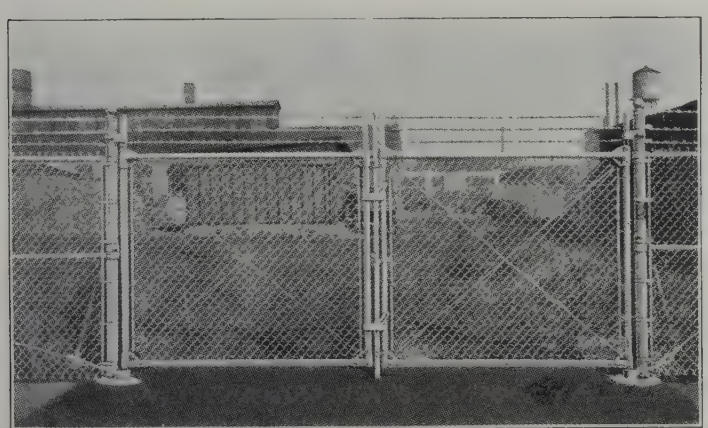
Continued on next page

Cyclone Colonial "Complete Fence"

Standard heights: 36, 42, 48 and 54 in. Framework, tubular steel, hot-dip galvanized. Fabric, style "F." Pickets spaced 3 in. apart at top, 1⅝ in. apart at bottom

Safeguard Fence with Wrought Iron Gate

Standard heights: 36, 42 and 48 in. Framework, tubular copper-bearing steel hot-dip galvanized. Fabric "Galv-After" Chain Link copper-bearing Steel No. 9 gauge. 2-in. mesh



Cyclone Swinging Gates

Either single or double, for Safeguard or Invincible Fence

Wrought Iron Entrance Gate, Pattern No. 501

Cyclone wrought iron fence and entrance gates are built in a variety of heights and handsome patterns from which fencing appropriate for any purpose may be selected

Specifications, Cyclone Swinging Gates

Standard Sizes—Single swinging walk gates built standard for 4-ft. opening. Double swinging gates for driveways built standard for 14 and 18-ft. openings. The standard size for railroad entrance is 18 ft. Where conditions are such that standard sizes can not be used, gates are built to meet requirements.

Frames—Hot-dip galvanized, tubular copper-bearing steel; made by the National scale-free process. On fence having barbed wire top, the end members extend 1 ft. above top horizontal rails, and carry 3 strands of barbed wire.

Stays—Hot-dip galvanized, tubular copper-bearing steel. Made by the National scale-free process. Stays, together with ⅜-in. adjustable truss rods, keep gate absolutely rigid; prevent sagging, buckling and side weave.

Fabric—Cyclone "Galv-After" Chain Link to match fabric used in fence furnished.

Hinges—Hot-dip galvanized. Made of malleable iron. Exceptionally large bearing surface for clamping hinge on gate post. Cyclone swinging gate hinge equipment will carry 100% overload. Bottom hinge is ball and socket pivot type.

Latch and Lock—Hot-dip galvanized. On swinging gates of all types, latch is of the plunger bar type, arranged for padlock locking. Railroad and drive gates are equipped with catch posts to hold gates in open position.

Specifications, Cyclone Sliding Gates

Either single or double, for Safeguard or Invincible Fence.

Standard Widths—14 to 20-ft. opening for driveway. Standard overhead clearance 14 ft.

Overhead Track Support—5-in. channel, weight 6½ lb. per lin. ft. Fastened to gate posts by means of combination special ornamental ball post top cap and channel support.

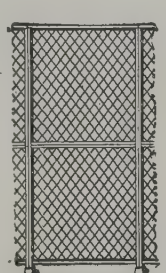
Trolley—Double truck roller bearing type. Very easy to operate. Track completely enclosed.

Wire Work of All Kinds

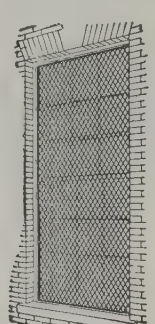
Partitions (Built-in-Sections)—Standard size sections 4 ft. wide by 8 ft. high. Frames are 1-in. channel iron. Fabric is No. 10 gauge wire woven in 1½-in. diamond mesh. Furnished with either swinging or sliding gates. Handholes or wickets provided where needed. Floor flanges furnished for either wood or concrete floors. Sections are interchangeable, movable; can be taken out and used elsewhere—no refitting—no loss. Quick changes in departments can be made at any time.

Send blue print or layout of partition work wanted.

Window and Skylight Guards—Frames are 1-in., ¾-in. channel, or ⅜-in. round iron. Fabric is usually No. 10 gauge wire woven in 1½-in. diamond mesh. Channel iron frames fit into openings. Round iron frames usually allow ¾ in. on all sides for lap. Special guards built with either channel or round iron frames, using size of wire and mesh desired.



Partition Section



Window Guard

Complete Responsibility—Nation-wide Fencing Service

Engineering Counsel—Cyclone Engineers will make a complete study of your fence requirements and submit recommendations, layouts, and estimates of cost.

Cyclone Erection Crews—There are more than 100 erection crews constantly at work installing Cyclone Fence. One of these crews is available for your installation and will handle the work quickly, correctly and economically.

However, if you prefer to have your own workmen install the fence, a Cyclone erection superintendent will be furnished at nominal charge, to direct them.

Diagram, Prices, etc.—When writing for information, prices, etc., send simple diagram of proposed fencing. Give measurements of each stretch and total measurements. State whether single or double swing, or sliding gates are wanted and give size of opening.

J. W. FISKE IRON WORKS

Ornamental Iron, Brass, Bronze, Wire and Zinc Work

69-71 Park Place

NEW YORK, N. Y.

Products

Ornamental Metal Work and Fencing as follows: Ornamental Entrance Doors, Window Guards, Lamps and Lamp Standards; Metal Stairs; Memorial Tablets; Fountains; Iron Railings and Entrance Gates; Woven Wire and Climbproof Chain Link Fencing; Sanitary Stable and Barn Equipment.

Also Brass and Bronze Railings; Andirons and Fire Sets; Fire Escapes; Flagpole Bases; Balls and Trucks; Folding Gates; Leader Shoes; Marquises; Garden and Park Furniture; Sundials; Tree Guards; Wire Partitions.

Fiske Quality

The quality of Fiske products is best evidenced by installations for the United States Government, States, cities and leading commercial organizations, and upon many of America's largest private estates.

Co-operative Service

The J. W. Fiske Iron Works will submit estimates for products either delivered or erected complete. A well organized engineering staff is maintained, and contracts for designing and erection complete are made when desired. Co-operation with the architect, contractor or owner in executing unusual specifications is a specialty.

Entrance Gates, Fencing and Ornamental Iron Work

This company will carry out any design in ornamental entrance gates, iron fencing, window guards, metal stairs and similar work, or will prepare and submit designs for such work.

Sanitary Stable and Barn Equipment

In most of the finest stables in this country Fiske Sanitary Stable and Barn Equipment has been installed. This includes both the privately owned and commercial stables. Hundreds of architects have specified our equipment because they have felt that by so doing they best served the interests of their clients.

On this page a few standard details are shown, the result of more than 70 years of specialized experience in this class of construction. You will find us ready to co-operate when unusual conditions require special treatment.

Our complete catalogue of stable equipment will be sent on request, as well as any special information that may be required.

SCS A FEW OF J.W. FISKE IRON WORKS SPECIALTIES AUG 1928

ENTERPRISE IRON & WIRE FENCE CO.

Manufacturers of Fencing and Ornamental Iron

Yandes and 24th Streets

INDIANAPOLIS, IND.

Products

WROUGHT IRON FENCES and GATES.
ORNAMENTAL IRON WORK.

Factory

The factory is divided into two departments. The *fence shop* is equipped with modern machinery and Enterprise patented *caulking* machines for quantity production of standard and special designed wrought iron fences. The *gate shop* is manned by craftsmen experienced in the fabrication of hand-wrought ornamental iron.

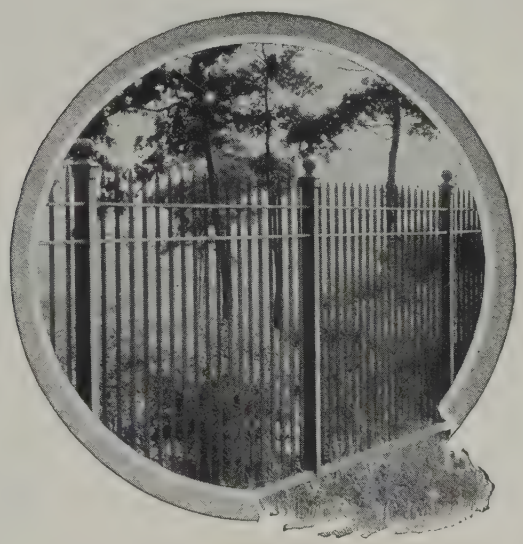
Experience

An experience of over 45 years covers the fabrication of delicate entrance doors, balconies, etc., gates large enough for six motor cars to go through at one time and single contracts for as much as 3½ miles of iron fencing.

Construction

Construction is of wrought iron or common soft steel, at the option of the purchaser. Fittings are the best grade of cast or malleable iron.

Pickets are locked in place by the Enterprise patented *caulking* machines and other joints are mortised and tenoned.



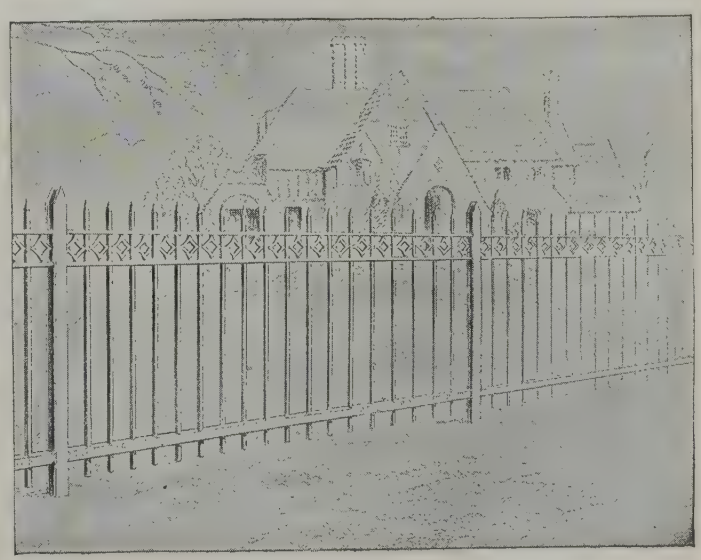
Erection and Installation

This is done by this company or by one of its regularly appointed agents.

Blueprints and Specifications

Will be furnished with the estimates without any charge.

Architectural sketches, such as the one shown below, can be made upon request, at a nominal charge of the actual cost of making such drawing or sketch.



THE STEWART IRON WORKS COMPANY

INCORPORATED

Manufacturers of Iron and Chainlink Fences and Gates

780 Stewart Block

CINCINNATI, OHIO

Products

PLAIN and ORNAMENTAL IRON GATEWAYS and FENCES; CHAINLINK WIRE FENCE.

Also Iron Railings, Iron Grilles, Bronze and Iron Lanterns and Lamp Standards, Lawn Furniture, Folding Gates, Window Guards, General Ornamental Iron and Wire Work.

For Jail and Prison Construction, see page C4158.

Facilities

This company, "The World's Greatest Iron Fence Builders," with its unsurpassed facilities for the manufacture of iron fences and gates, has a factory containing 350,000 sq. ft. of floor space and covering an area of 8 acres; the equipment of the most modern machinery; an experience of more than 42 years; a complete organization of specialists in engineering and landscape architecture, and a large force of skilled mechanics and draughtsmen.

This equipment insures the highest standard of work and enables THE STEWART IRON WORKS COMPANY to give prompt service at proper prices.

Specialties

This company specializes in the building of high grade ornamental iron fences and entrance gates, either from the designs of its own draughtsmen or from drawings and specifications submitted by customers or their architects.

They give particular study to the correct designing, proportioning and construction of enclosures and entrances of country houses and estates, as well as the simpler or more pretentious town house.

Special attention has also been given to designing simple and artistic enclosures for yards in the rear of city and suburban dwellings, providing security and eliminating the feeling of confinement produced by solid fences; with the added advantages of maximum sunlight, elimination of dark corners which conceal rubbish; and making the many small plots of green into a community garden for the enjoyment of all.

From its experience, this firm is qualified to advise as to the type of fence best adapted to particular conditions, and to aid in the most satisfactory and economical solution of fencing problems.

All types of plain and ornamental fences and gates, light or heavy, in iron or chainlink wire, for factories, public institutions, etc.

Decorative Iron Work

At innumerable points in the modern home the architect and builder find the use of interior stair railing, balconies, solarium grilles, terrace railing and other decorative iron work as developed by this company necessary to give the final touch of beauty as well as utility to the interior and exterior.

Designs

The illustrations here are but a few of the many designs shown in this company's catalogues. Plain stock designs are featured in their Catalogue; special ornamental designs in "Book of Designs C."

These catalogues will be sent to architects and prospective purchasers on request.

The diagrammatic illustration on this page depicts the barbed-wire topped non-climbable type Stewart Fence. Except for the barbed-wire arms and barbed-wire, the same general construction is standard, and the same type fittings are used for Stewart Style O T H Fences.

Stewart's Chainlink Wire Fence and Gates

Our product is the result of proven principles of construction which produce a quality unexcelled. We offer a service that has demonstrated its value to a clientele in all parts of the United States and many foreign countries. Our organization of factory salesmen and erecting representatives located at advantageous points affords quick and efficient co-operation to those who place their orders with us.

Fabric, including barbed wire overhang, is hot-dip galvanized *after* weaving; posts, top rail, bolts and other fittings are also hot-dip galvanized, which insures complete rustproofing. The arms for supporting barbed wire overhang lock the strands securely in place and at the same time provide for contraction and expansion.

Standard Type 3T Fence—This type of fence is very generally used where maximum property protection is desired. It is usually 7 or 8 ft. high over all, including either 3 or 5 strands of barbed wire above the fabric. Fabric is either No. 9 or No. 6 gauge wire, 2-in. mesh, with barbed selvages at top and bottom. Intermediate posts are tubular steel, 2½-in. outside diameter or 2½x2x¼ in. angle bars for setting 10 ft. apart, 2 ft. 6 in. below grade. We recommend concrete footings for permanence. Top rail is 1⅝-in. diameter and connected by expansion sleeve couplings. Fabric is attached to posts and top rail with special zinc bands. Bottom of fabric is reinforced with No. 6 gauge coiled spring wire.

This fence is also furnished without barbed wires above (Style OT), in which case we use ornamental No. W-8 post tops. For the sake of economy the top rail is sometimes omitted, and in this case we use the coiled spring wire No. 7 gauge at both top and bottom of the fabric for additional reinforcement.

Stewart's Chainlink Tennis Court Fence—Fabric hot-dip galvanized *after* weaving; framework and fittings all hot-dip galvanized. Furnished in two specifications:

Heavy Construction—Chainlink Fabric 2-in. mesh No. 9 gauge or 1¾-in. mesh No. 11 gauge copper-bearing steel wire; intermediate posts, 2½-in. outside diameter tubular steel (weight 3.65 lb. per ft.) spaced 10 ft. apart, for setting 2 ft. 6 in. deep in concrete; top rail, 1⅝-in. outside diameter (weight 2.27 lb. per ft.); reinforcement wire at bottom of fence and about 4 ft. above grade No. 6 gauge galvanized coiled wire; end, corner, and gate posts 3-in. outside diameter (weight 5.73 lb. per ft.) for setting 3 ft. deep.

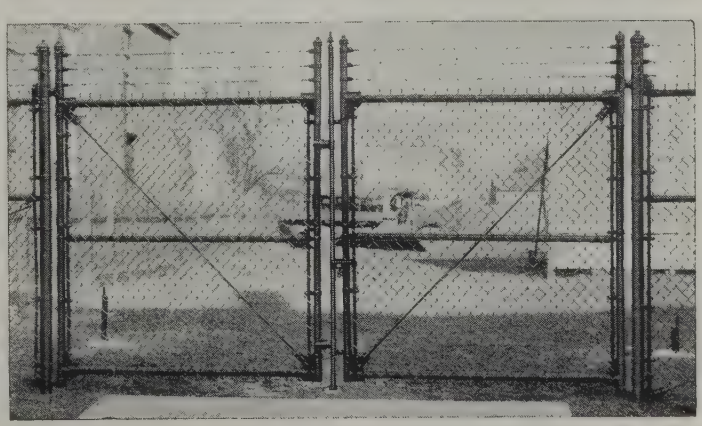
Light Construction—Chainlink Fabric 1¾-in. mesh No. 11 gauge copper bearing steel wire; intermediate posts 2-in. outside diameter tubular steel (weight 2.72 lb. per ft.) spaced 8 ft. apart; top rail 1⅜-in. outside diameter (weight 1.66 lb. per ft.); end, corner, and gate posts 2½-in. outside diameter. Specifications otherwise are the same as for the heavy construction.

Stewart's Chainlink Fabric—Woven of No. 6, No. 9, or No. 11 gauge copper-bearing steel wire hot-dip galvanized *after* weaving. This fabric has a galvanized coating which actually weighs between eight and nine per cent of the finished product, and the coating is approximately five times heavier than that of the regular grade of galvanized wire.

Stewart's Chainlink Lawn Fence—Far superior to the ordinary types of lawn fence. It is stocked in 36, 42 and 48-in. heights, in the 2-in. mesh No. 9 gauge fabric. Intermediate posts are 2-in. outside diameter, spaced 10 ft. apart, for setting 2 ft. 6 in. deep in concrete; end, corner and gate posts are 2⅜-in. outside diameter for setting 3 ft. deep.

Note: Often excellent artistic and practical results are obtained around residences by using the Chainlink Lawn Fence in combination with wrought iron entrance gates.

"Heavy Duty" Gates—Furnished in any width. We also furnish sliding gates. These have 1⅘-in. outside diameter steel tubular frames joined with pressed steel corners. They have horizontal cross member and ½-in. solid round steel brace rods. We guarantee them sagless. Hinges are forged steel, located below the bottom rail and above the top rail, thus rendering maximum efficiency.



"Heavy Duty" Gates

The Double Gate Latch Device—Very simple and effective. It permits opening the left-hand gate independently of the right. It is locked by means of a padlock which can be operated from either side of the gate.

Gate Equipment—Includes a center stop for setting in concrete and automatic backstops to hold the gates in open position.

Stewart's Road Guard Fence—For dangerous embankments, curves and bridge approaches. Woven of No. 6 gauge copper-bearing steel wire into 2-in. mesh fabric, 24 in. high, with knuckled selvages both top and bottom, galvanized *after* weaving. Furnished painted white if desired.

Products

Chain Link Fencing for protection and ornamental purposes of every description.

Wrought Iron Fencing for industrial, institutional and residential purposes.

Industrial Fencing for factories, mills, refineries, railroads, power stations, mines, yards, etc.

Fencing for city, state and national institutions, including schools, parks, playgrounds, prisons, hospitals, etc.

Enclosures for athletic fields, tennis courts, baseball grounds, amusement parks, aviation fields, automobile parking enclosures, etc.

Also manufacturers of Page "Hi-Way" Guard; Panel Partitions, made of Page Chain Link fabric, for factories, offices, warehouses, stockrooms, etc.; Fencing and Entrance Gates of copper-bearing steel for residences, estates, country clubs, etc.; Page Chain Link Specialties: Window and Skylight Guards, Display Signs, etc.

TRADE-MARK

The first wire fence ever made was designed by J. Wallace Page in 1883. For 45 years Page fences have been standards of good fence design

Only Page Drawn Wire Meets with Page Specifications

To assure the high standards for uniformity and strength set by Page engineers, every bit of wire used in Page products is rolled and drawn and galvanized in the Page mills. The most rigid inspection guarantees only perfect material being used.

All Page fabric is heavily galvanized after weaving by a special Page hot-dip process that assures a uniform coat of zinc—approximately five times heavier than ordinary galvanizing.

Tests, carried on both in the laboratory and in actual service, prove that the heavier coat of zinc results in a more durable fence, especially when the base metal is uniform and of high quality.

There Is a Page Distributor Near You

In each district of the United States and Canada there is a responsible firm of fence engineers that carries complete stocks of Page products and specializes in fence construction. This assures expert performance of the work all the way through, and gives the advantage of consultation with men of long experience in the erection of fences.

Estimates gladly furnished on receipt of rough sketches of proposed work, or complete detailed designs will be drawn up, if desired, and estimates supplied.

Get in touch with the distributor nearest you, as listed above, or write direct to Association Headquarters for interesting literature.

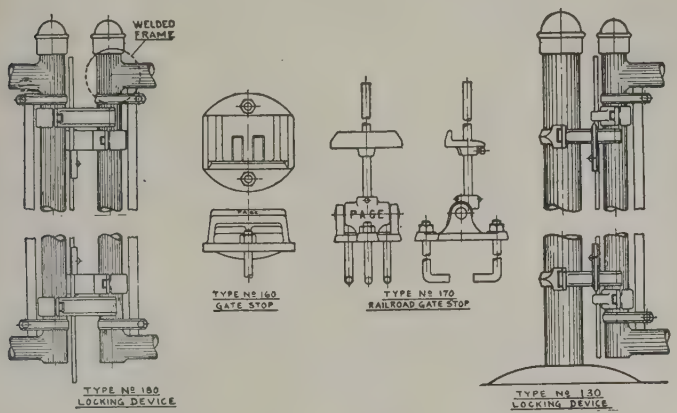
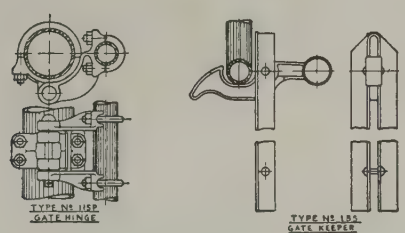
Complete Mechanical Drawings

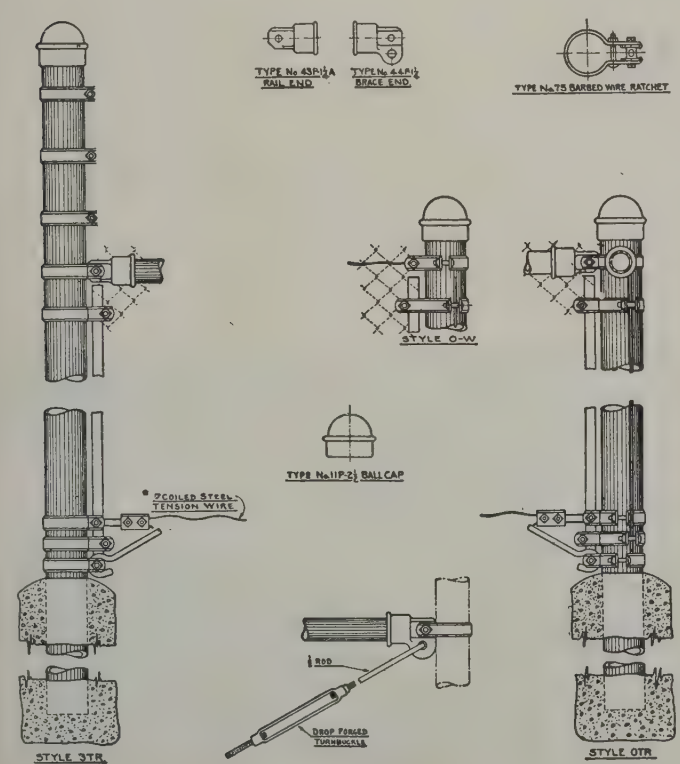
Complete mechanical drawings and specifications available to all who request them.

All fittings are heavily galvanized with best grade of zinc obtainable.



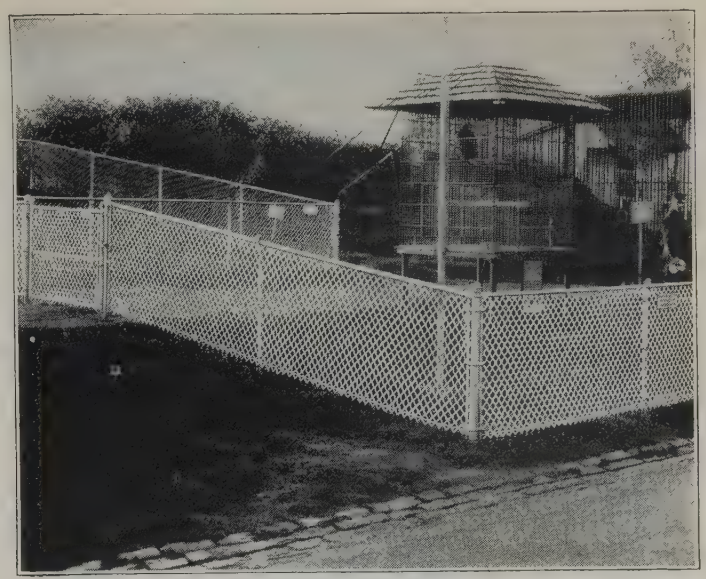


Our latest catalogue gives detail drawings and specifications for *all* Page Chain Link Fence Fittings. A copy will be sent on request.



Shown above are just a few of the fittings to Page Protection Chain Link Fence and detail drawings of only two of the six standard styles available.

Details of the six styles are shown by line drawings on the preceding page.



Page Chain Link Fence Offers Permanent Protection for Zoological Gardens and Other Park Property

Page Wrought Iron Fence

Shown below are the four most widely adopted styles of Page Ornamental Wrought Iron Fence. This durable fence is furnished in 8-ft. panels with ⅝-in. adjustment, and in six different heights ranging from 37 to 72 in. Pickets are spaced on 4 or 5-in. centers, and in ½, ⅝ or ¾-in. size; have forged points and are securely locked into wrought iron channel rails. Line posts may be either 3-in. I-beam or solid bar as specified. Standard sizes of drive gates are 10, 12 and 14 ft.; walk gates, 3, 3½ and 4 ft. All gates are fully equipped with attachments for lock, center stop, keeper, hinges, etc.

Wrought iron is "the most enduring of all metals" which results in Page Ornamental Wrought Iron Fence, made under Page supervision and in accordance with the high standards of Page craftsmanship, being desirable wherever dignified protection is needed.

Specifications for Page Chain Link Fence

Line of Fence

Chain Link Fabric—Shall be of copper-bearing steel containing not less than 20/100 of 1% copper and galvanized after weaving. Usual specifications for factory fence are 2-in. mesh No. 6 or No. 9 gauge (W&M). Residential, 2-in. mesh No. 9 and 2-in. mesh No. 11 W&M gauge. Tennis court construction, 1¾-in. mesh No. 11 W&M gauge.

Line Posts—Shall be of hot galvanized copper-bearing steel pipe and furnished in: 2-in. outside diameter, weight 2.717 lb. per ft. for fences under 6 ft. high and 2½-in. outside diameter, weight 3.652 lb. per ft. for fences 7 ft. high and over. Posts are spaced on 10-ft. centers and set 3 ft. deep in bell shaped concrete footings crowned at the top to shed water and prevent rusting.

Top Rail—Shall be 1⅝-in. outside diameter copper-bearing steel pipe hot galvanized, weighing 2.272 lb. per ft. in random lengths, the average of which shall not be less than 15 ft.

Expansion Sleeve—(No. 1027 P 1⅝.) Shall be extra long to give a rigid connection and to provide for expansion and contraction in connecting lengths of top rail. Shall be made of pressed steel heavily galvanized.

Intermediate Post Tops—(No. 15-24-25-30-45.) Shall be made of heavily galvanized malleable iron and fitting over posts to exclude moisture. To be used with top rail or tension wire, as specified. Post tops for styles of fence calling for barbed wire shall be provided with stamped iron extensions.

Fabric Bands—(No. 1020.) For attaching fabric to line posts shall be made of rustless zinc alloy. These can not be removed without a tool and leave posts free of drilling.

Tension Wire—To prevent forcing fabric between posts, all Page Fence shall be provided at the bottom with a No. 7 gauge double-galvanized high carbon steel coiled wire.

All "W" styles of fences shall be provided with this same type of wire at the top to support the fabric instead of the top rail.

Terminal Posts

3-in. outside diameter—weight 5.79 lb. per ft.—end, gate and corner posts.

4-in. outside diameter—weight 9.10 lb. per ft.—gate posts.

6⅝-in. outside diameter—weight 18.97 lb. per ft.—gate posts.

All the above shall be hot galvanized copper-bearing steel pipe and of sufficient length to set 3 ft. in bell shaped concrete footings. End and gate posts for styles of fence provided with barbed wire shall extend 1 ft. above fabric—to provide support for barbed wire.

Gate, End and Corner Post Tops—(No. 11-26-31-46.) Of same design as intermediate post tops. Terminal posts for fences with barbed wire shall be supplied with top equipped for barbed wire.

Brace and Tension Bands—(No. 1001-1002-1006-1007.) Shall be of unclimbable beveled edge steel type provided with ⅜-in. square shouldered, hot galvanized carriage bolts which can not be removed from the outside.

Brace Assembly—(Rail end No. 43 P 1¼ A, brace end 44 P 1¼, and brace rod No. 1030.) All end and gate posts shall be furnished with one complete brace assembly as follows: 1 piece 1⅝-in. outside diameter copper-bearing steel pipe for brace, weighing 2.272 lb. per ft., which shall be used as a compression member, ½-in. diameter steel brace rod with drop forged turnbuckle, to be used as a tension member, 1 malleable iron rail and brace with necessary brace bands, and bolts for attaching to post. Corner posts shall be furnished with two complete brace assemblies.

Tension Bars—(No. 1046.) A tension bar of ⅜x¾-in. flat bar shall be run through the first spiral picket in a roll of fabric and secured to the post by means of tension bands. This method of terminating the fabric is to distribute the strain evenly over its entire length, and thus avoid the distortion of the fabric at the bolts.

Gates

Frames—Shall be of 2-in. outside diameter copper-bearing steel pipe construction weighing 2.717 lb. per ft. with intermediate braces of 1⅝-in. outside diameter copper-bearing steel pipe weighing 2.272 lb. per ft. All joints shall be welded making a rigid and watertight frame.

Gate Filler—Frames shall be filled with fabric to match that in the line of fence and shall be furnished with or without barbed wire—as specified. When barbed wire is specified, ratchets shall be furnished on the gate extension to provide a means of keeping the wire taut at all times.

Hinges—(No. 115.) Shall be of the double clamping offset type allowing the gates to swing back parallel with the line of fence and shall be made of malleable iron and forgings heavily galvanized.

Latches—(No. 130 and No. 180.) Shall be of the eccentric double locking type which engages stops securely bolted to gate frame at both top and bottom. Lever handle is drop forged steel insuring the greatest strength possible without additional weight. Lock bars are of steel, the lower one sufficiently long to extend down when locked, engaging an extra heavy malleable iron non-freezing gate stop for drive gates and a disappearing type of stop for railroad gates. Either stop shall be securely fastened to a large concrete footing in the center of the opening.

Keeper—(No. 155.) Each gate frame shall be furnished with a keeper, the purpose of which is to automatically catch and hold the gate when swung open.

Auxiliary Brace—(No. 1047.) With all gate posts for single gates 12 ft. wide or double 24 ft. wide and over, there shall be furnished a diagonal or strut brace of 2-in. outside diameter copper-bearing steel pipe with necessary brace end and band for attaching to post. This brace shall be set inside and at right angles to the fence line to relieve the strain on the gate post when the gates are in an open position.

All gate fittings shall be heavily galvanized with the best grade of zinc.

The Nonclimbable Barrier Provided by Page Chain Link Fence in This Typical Installation Affords Ample Protection

Page Chain Link Fence with Barbed Wire Attached Insures Outlying Property Against Trespassing

MICHIGAN CEDARCRAFT COMPANY

Manufacturers of Rustic Equipment

GREENBUSH, ALCONA COUNTY, MICH.

Products

"CEDARCRAFT" RUSTIC FENCING.

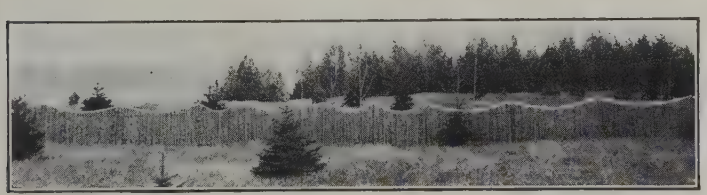
Also, Bird Homes, Bridges, Cabins, Ferneries, Rose Arbors, Summerhouses, Swings, Golf Covers; Furniture for the lawn, porch, home and club; all manufactured from Michigan White Cedar.

"CEDARCRAFT"
TRADE-MARK

"Cedarcraft" Fence Primitive

The aristocrat of all fencing. Pronounced by landscape architects the most beautiful fencing on the market.

Left in the natural bark, no other fence offers just that same blending effect with nature's background, and the curved top of this fence which is brought into relief by the soft silver gray tone of the sharp edged (not pointed) tops of the pickets presents a graceful appearance obtainable by no other means.



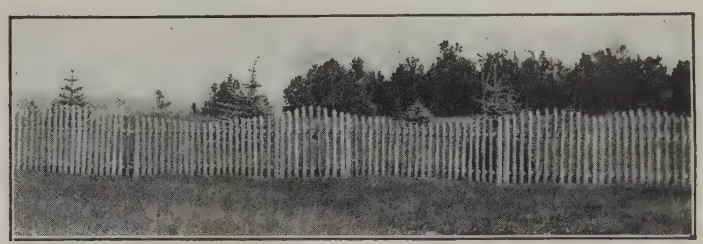
"Cedarcraft" Fence Primitive

Produced in three designs, under-curve, over-curve and alternate over-curve and under-curve sections, with several different type gates from which to choose.

Height of under-curve sections: maximum, 48 in.; minimum, 39 in. Height of over-curve sections: maximum, 57 in.; minimum, 49 in.

"Cedarcraft" Picket Fence

Posts, rails and pickets used in this fence are without the bark and the natural wood develops through weather seasoning into the well-known silver gray tone.



"Cedarcraft" Picket Fence

For one who desires a stained fence, either Forest Brown or Forest Green may be ordered.

Produced in under-curve, over-curve and alternate under and over-curve sections.

The illustration shows an assembly of under-curve and over-curve sections.

Height of under-curve sections: maximum, 42 in.; minimum, 36 in. Height of over-curve sections: maximum, 48 in.; minimum, 42 in.

Service and Catalogues

All fencing shipped complete with posts, ready for erection by inexperienced labor.

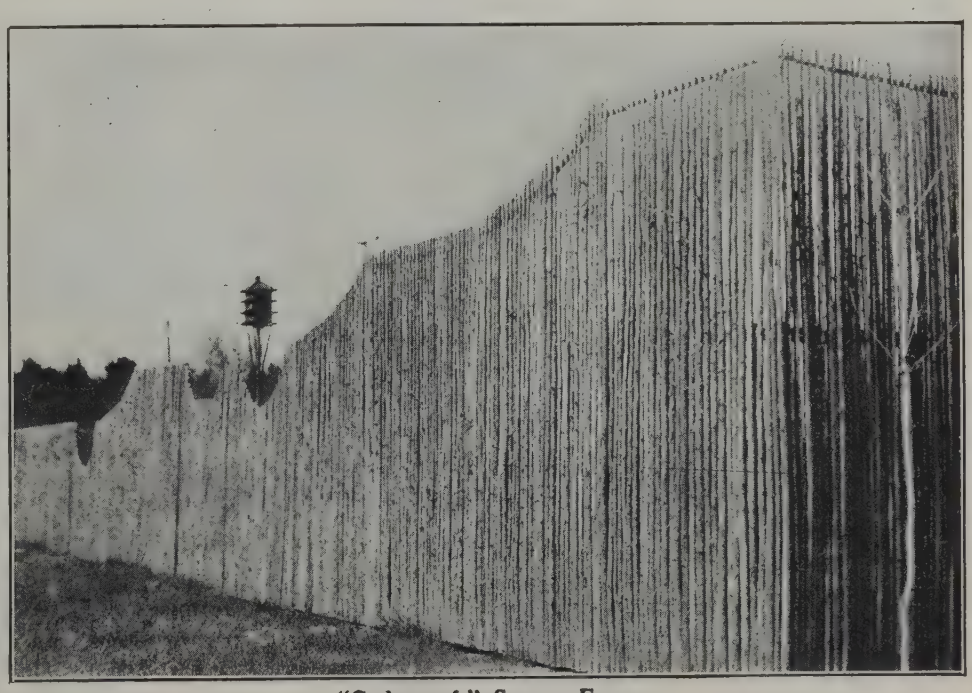
Take up your fencing problems with us. Illustrated catalogue will be gladly sent to you.

Illustrated catalogues on our other products also furnished upon request and estimates submitted on special designs.

"Cedarcraft" Screen Fence

A fence in the natural bark. Illustration shows a composite view of 6, 8, 10 and 12-ft. heights, with graduated sections. Note the screen effect. Produced in straight top or under-curve design.

Similar in construction to the "Cedarcraft" Fence Primitive, its obviously durable construction (which causes it to sturdily withstand the elements) combined with its individual appearance have solved many fencing problems. In addition to being a distinct embellishment to the grounds, it affords privacy and can be used to eliminate disturbing or unsightly views on one's own or a neighboring property, and it is as effective in winter as summer. Among the purposes to which individuals and clubs have adapted it is its use at tennis courts.



"Cedarcraft" Screen Fence

ESTABLISHED 1860

ROBERT C. REEVES CO.

Manufacturers and Distributors of Wooden and Wire Fences

Products

Dubois Woven Wood Fence—a closely woven fence made in France of split chestnut saplings.

Cleft Chestnut Fence—similar to Dubois, with saplings spaced 1 in. apart.

Reeveshire Hurdle Fences and Gates.

Old-fashioned Post and Rail Fence.

Copperweld Chain Link Fence.

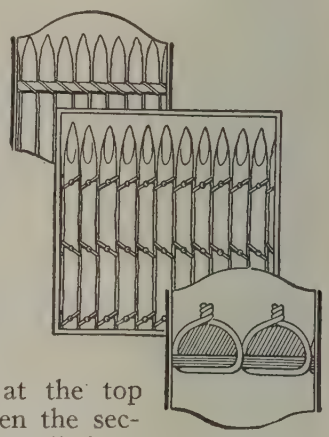
Dubois Woven Wood Fence

No other fence is quite like this one. It is made of split, live, chestnut saplings, closely woven together and bound to horizontal bracings with heavy, rust-proof Copperweld wire. The work is all done by hand. So perfectly are the saplings matched that outsiders cannot see through.

Its uses are many and varied. Originally it was designed to give privacy and seclusion to old French gardens and to hide famous estates from the public's gaze. But today it serves in all sort of ways, from screening a neighbor's garage, or shutting off a laundry yard or service entrance to making a metropolitan roof garden look like the real thing.

Dubois is not only extremely serviceable, but it adds a touch of rustic charm wherever used. It is a beautiful fence, harmonizing with almost any type of architecture. The saplings are a natural brown in color, which mellows as time goes on to a lovely silver-gray.

One of the great advantages of Dubois is its extreme economy over a long period of years. It literally lasts a lifetime, and you do not have to paint it as you do other fences. Nor does it require other forms of upkeep expense. This makes it an ideal choice for practically any type of duty: country, suburban, or city. It is also moderate in cost.



Sizes and Erection—Dubois is now made in four sizes, 6 ft. 6 in., 4 ft. 11 in., 3 ft. 10 in., and a special 18-in. height for trimming flower beds and garden paths. It comes in sections 5 ft. wide, and is shipped ready to erect against a framework of posts and cross-pieces which any carpenter can supply. The posts should be placed about 8 ft. apart. The stringers are fastened at the top and 1 ft. above ground. Then the sections of Dubois are simply nailed to them. It is a job almost anyone can do.

A special framework of mortised and tenoned posts and cross pieces made of Michigan cedar, finished to harmonize with the sylvan aspect of Dubois, can be supplied when desired. Gates, either curved or straight at the top, are furnished to match the fencing.

Cleft Chestnut Fence

Like Dubois, except the saplings are spaced 1 in. apart. Meets the demand for a fence both artistic in character and very moderate in price. This style of fencing comes in 16-ft. rolls, in three heights, 6 ft. 6 in., 4 ft. 11 in., and 3 ft. 10 in. It does not afford the same degree of privacy as Dubois, but there are many places where it can be used, and at a desirable saving in cost.

Literature

For further details, send for free album of Dubois illustrations specially prepared for architects and landscape architects. Folders describing other Reeves fences with prices also sent free on request.

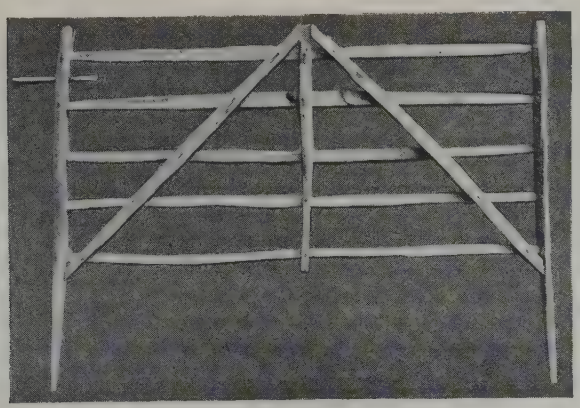
Reeveshire Hurdle Fence

An adaptation of the cleft chestnut hurdle fence which has been used in England for centuries. It is made of split chestnut timber, constructed in sections or hurdles, each hurdle being 8 ft. 3 in. long. At each end is a 6-ft. post which extends 18 in. into the ground,



A Section of Reeveshire Hurdle Fence

making the fence 4 ft. high. The posts of one hurdle lock easily with those of adjoining hurdles by means of wooden pins which are supplied. This makes for exceeding strength, as no one post is required to support alone a strain on its particular hurdle.

The hurdles are made in three styles, 4, 5 and 6-bar, all of which are the same length and height, the difference being in the spacing between the bars.

Uses—Reeveshire Hurdle Fence is something more than an enclosure—it is decidedly an artistic fence, possessed of unusual rustic charm, and blends well with

A Strong Pasture Fence

many types of architecture. Recently there has been an increasing demand for it as a boundary fence for large estates, a division fence in the suburbs, or to accentuate the setting for a residence of the English farmhouse or similar type.

The 4-bar hurdles are suitable for enclosing pastures for cattle where a close fence is unnecessary.

The 5-bar hurdles make an ideal fence for paddocks or pasture for spirited horses and are used for this purpose on the estates of many of the leading horsemen of this country. Hurdle fencing is easily seen by colts and they will not injure themselves by running against it.

The 6-bar hurdles make a very close fence and are particularly suited for enclosing pastures or pens for sheep or pigs.

Erection and Removal—Reeveshire Hurdle Fence is easily set, requiring no digging of post holes. Two men can place from one to two hundred sections in a day. A hole is made in the ground with a crowbar and the end posts are driven in. The hurdles are then locked together with the wooden pins. It is easily taken down and transferred from one plot to another, and during the winter months may be compactly stored.

Reeveshire Hurdle Fence Gates—Made with 4, 5 or 6 bars to conform to the three styles of fencing. Stocked in 10-ft. lengths with extra braces. Furnished to order in any desired length.

Reeveshire Portable Post and Rail Fence—Much heavier than Reeveshire Hurdle Fence though of the same length and height when set. Posts extend 2½ ft. in ground. Generally used as permanent fences in hunting districts.

Old-fashioned Post and Rail Fence

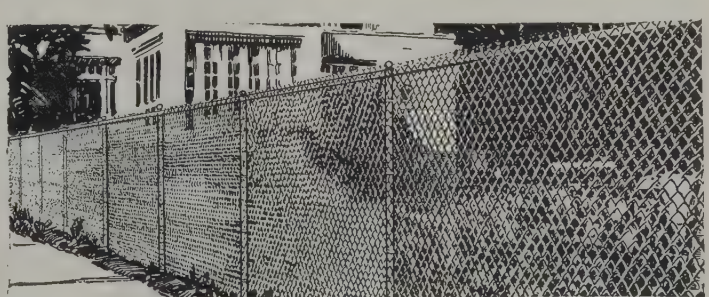
An authentic Early American post and rail fence for farm use. Made of split chestnut. Ideally suited for erection in hunting country.

Old-fashioned Post and Rail Fence

Copperweld Chain Link Fence

Enduring Copperweld Fence offers permanent protection and eliminates painting and the usual maintenance and replacement costs. Beautifies as it protects.

We are prepared to give you complete service—from the first plans to the final erection. Literature and prices on request.



Copperweld Chain Link Fence

Service to Architects

Our Service and Advisory Department will gladly assist in the solution of any fencing problem. Our 68 years of experience place us in a position to make specific suggestions as to the adaptability of fencing to special requirements.

ALUMINUM COMPANY OF AMERICA

Manufacturers of Aluminum and Aluminum Alloys

PITTSBURGH, PA.

Product

ALUMINUM for ORNAMENTAL METAL WORK.

For Aluminum Roofing, see page A508; for Aluminum Paint, see page B2034.

Aluminum for Ornamental Metal Work

Aluminum is applicable to ornamental metal work ranging from the finest grades to the commercial grades and forms. Because of its light toned permanent color, high resistance to corrosion, non-staining properties, light weight, uniformity, and easy working properties, it is finding increasing use in the architectural field for general sheet metal and ornamental metal purposes.

Aluminum Casting of Grille in Fifth Church of Christ, Scientist, Cleveland, Ohio

Physical Characteristics of Aluminum

Color—The permanent silvery gray color makes aluminum very desirable as a decorative material and the various alloys furnish a considerable range in strength and workability.

Resistance to Corrosion—The resistance of aluminum to atmospheric corrosion is very good, as is witnessed by installations of varied forms ranging in location from tropical to high latitude conditions.

Light Weight—Aluminum has a specific gravity of approximately 2.8 and weighs $\frac{1}{10}$ lb. per cu. in. As this is one-third the weight of other commonly used metals, ease of erection is a natural consequence.

Will Not Discolor Adjoining Materials—Aluminum forms no colored salts and does not discolor surrounding or supporting structures from drip or splash of watershed.

Strength—Specifications of aluminum range from fully annealed 2S0 pure metal (12000 lb. per sq. in. tensile strength, 25% elongation in 2 in., Brinnell hardness, 22) to special 17S alloy (65000 lb. per sq. in., 20% elongation in 2 in., Brinnell hardness, 92).

Easily Worked—Aluminum machines easily and is capable of taking and holding a high polish.

Two Aluminum Castings Like This Are at the Entrance to the St. Louis Civil Courthouse, St. Louis, Mo.
The castings are 11 ft. high, 19 ft. long and 12 ft. wide

Cost

The cost of installing aluminum is of course dependent on the design and quality of work, and compares with the cost of installing high grade materials.

Actual cost of aluminum per unit of weight is divisible by three for comparison by bulk with cost of other similarly used metals.

Marketable Forms

Aluminum and aluminum alloys are obtainable in the form of ingots, sheets, rods, bars, tubing, rivets, bolts, extruded moulding, and structural shapes for fabrication.

Products

ANACONDA from mine to consumer

ANACONDA ARCHITECTURAL BRONZE, BRASS AND COPPER for ornamental and structural purposes as used for over twenty-five years by leading fabricators of ornamental and structural metal work, including Cornices, Pilasters, Grilles, Wickets, Counters, Door and Window Trim, Screens, Hand Rails, etc.

For Anaconda Sheet, Roll and Strip Copper, see page A509; for Anaconda Brass and Copper Pipe and Anaconda Copper Service Tubes, see page C2701.

Extruded Architectural Bronze Shapes

In the extrusion process, a bar of bronze is forced under hydraulic pressure through a hardened steel die of the proper cross section. The resulting product obtained is of a homogeneous texture, very strong and durable, and in every way superior to a bronze casting. There are no pocked surfaces, porosities or any of the defects frequently found in castings.

The tensile strength of Anaconda Extruded Architectural Bronze is never less than 45,000 pounds to the square inch.

The edges are sharp and clean, so that the exact detail of the architectural design is obtained.

Standard Patterns and Special Designs

Recently a large number of dies made up during the past twenty-five years for the production of extruded bronze shapes from designs by many leading American architects have been released for general use. The availability of these dies saves the expense of special die making, thereby reducing the cost of fine bronze work.

We recommend a careful study of our catalogue of available standard shapes, a copy of which will be sent on request.

Cold Drawn Shapes

When light mouldings and shapes are required with walls 1/8 inch or less in thickness, the drawn process is used to produce Anaconda Bronze Shapes.

These cold drawn shapes are used for a great variety of architectural purposes, such as interior trim, window frames, showcases, store fronts, etc.

Colors

Anaconda Architectural Bronze Shapes, whether made by the extrusion process or cold drawn, have a natural golden color. After exposure the metal darkens and assumes the characteristic color of bronze. For interior use, the metal can be artificially colored to obtain any effect desired.

Estimates and Co-operative Service

THE AMERICAN BRASS COMPANY offers full co-operation in furnishing estimates and determining the suitability of Anaconda Metals for various uses. While estimates can usually be prepared from detailed blue prints and specifications, a representative of THE AMERICAN BRASS COMPANY will be sent at any time to consult with architects or fabricators whenever such consultation is requested.

Facilities

THE AMERICAN BRASS COMPANY is equipped for extensive production of Anaconda Architectural Shapes. The Company has complete facilities for serving the East from its mill at Ansonia, Conn., and the West from its mill at Kenosha, Wis.

Inquiries or orders should be sent to the nearest mill.

Manufacturers of Marquise

COVINGTON, KY.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

For Metal Covered Doors, see page A911

Marquise for All Classes of Buildings

Many years of experience in the manufacturing of marquise for all types of buildings have given us a great fund of practical knowledge on the subject. We design and construct marquise for theaters, hotels, banks, apartment houses, etc. We furnish and erect, any place in the country, all standard steel framing and use galvanized Armco ingot iron or sheet copper on all marquise furnished by us. We also build marquise according to architects' plans.

In our well illustrated marquise catalogue which we will gladly send on request, are shown many of our representative installations. Marquise suitable for buildings of all kinds are included. From these, suggestions of design and practice can be obtained.

Our engineering and architectural departments are composed of men who have specialized on marquise and are especially capable to solve any problem relating to their design or installation. They are at all times ready to submit sketches and estimates.

When making inquiries, give the following information: width of marquise across front of building and projection over sidewalk; select design from our catalogue or submit sketches; whether wiring is required on underside; specify reading of fixed letter signs; type of construction of building.

Signs, when furnished, are made as an integral part of the marquise with cornices, brackets and all mouldings applied. Wiring is complete with leads ready to connect to wiring in building. Letters furnished as follows:

No. 1 No. 2 No. 3

Interchangeable Letters for Marquise Signs

No. 1, a raised glass letter contained in a special frame, sizes from 4 to 12 in. No. 2 has a raised channel of metal outlining the letter, the metal being the only part removed for changing the reading. No. 3, similar to No. 2, either copper or zinc with bright facing on outline of letter. Nos. 2 and 3 in 8 and 12-in. sizes only.

Letters for interchangeable letter signs are furnished in sets of the proper assortment. "In," "and," "the," periods, quotation marks and sufficient blank spaces in assorted sizes are included.

Letters similar in construction to Nos. 1 and 2 and the exposed bulb channel type are furnished for signs having fixed letters

Designs and Catalogue

We have a very complete and comprehensive marquise catalogue which will be sent on request or, should it be preferred, our architectural department will supply a design which will fit the architecture of the building if a front elevation drawing is sent to us.

ESTABLISHED 1844

THE CINCINNATI MFG. CO.

Ornamental Bronze and Iron Work

MAIN OFFICE AND FACTORY
Corner Evans and Gest Streets
CINCINNATI, OHIO

Products

High grade ARCHITECTURAL and ORNAMENTAL WORK in BRONZE, BRASS and IRON, including:

Metal Work for Banks; Mausoleum Bronze; Memorial Tablets and Bronze Signs; Wire and Iron Work; Railings; Wickets and Grilles; Tubular Railings; Window Guards; Machinery Guards; Collapsing Gates; Wire Partitions.

For Kalamein and Hollow Metal Doors and Elevator Enclosures and Cars, see pages A932-933.

Experience

This company, organized in 1844, has had extensive experience in ornamental bronze and iron work. We are in position to handle any proposition in this field regardless of the size or the requirements of speed in delivery.

Facilities

Our plant and equipment is entirely modern and complete in every detail. It consists of foundry, machine shop, pattern shop, blacksmith shop, plating and polishing plants, baking and japanning ovens, drafting department, modeling and sculpture department, iron and wire working department, and chasing department.

Also compressed air and air brush equipment, sand blast, spot and acetylene welding, wood finishing on steel, draw bench work, heavy press work and heavy brakes and shears.

In addition, there is a large stock of materials, ample capital and skilled workmen at your service.

Bank Work

This is a big department with us. We can furnish everything in the way of bronze and iron ornamental work that is used in bank construction. Some of the work executed from architects' drawings and our designs is as follows: bronze doors and transoms, counter screens, grilles, railings, counter rails, deposit rails and grilles, vault rails, gates, wickets, hand rails and railings, guard rails, clock faces, calendars and check racks, desks and tables, directory boards, desk guards, teller cages, name plates, cast bronze signs and tablets and window guards.

Our illustrated bank catalogue No. 50 gladly sent on request.

Ornamental Uses

Brass and bronze are the standard metals for ornamental uses. They can be finished in various colors and require no painting or maintenance.

The scientific knowledge and practical experience of our Research and Building Service Departments are at your disposal. We will be glad to consult with you on all problems pertaining to the uses and applications of Copper, Brass and Bronze.

Literature

"Ornamental Bronze—Store Fronts and Entrances"—Thirty-two plates of contemporary work in ornamental bronze for commercial buildings. Sent to architects without cost. 8½x11 in.

"Coloring Copper and Brass"—Pamphlet-size booklet giving formulae for cleaning and coloring copper, brass and bronze. Sent free.

"Directory of Manufacturers"—Over 100 manufacturers of more than a score of brass and bronze products. Sent free. 6x7½ in.

Why Ornamental Bronze

The art of display is being employed to great advantage in modern American architecture, especially for commercial or semi-commercial buildings. Bronze grilles, decorative doorways, arches and figures are factors in determining the appeal of a building to prospective buyers and renters. The simplest elevation may be given great distinction by fine bronze work. In stores or shops a skillfully designed bronze entrance feature, such as the two illustrated here, will attract many shoppers.

For balustrades, bank cages, grilles, mail boxes, railings—in fact, for all ornamental features—solid bronze is the logical metal to use. Nothing else lends itself so well to the artistry of perfect craftsmanship—witness the fact that it was the metal chosen by the fine Italian workmen for those exquisite works whose beauty has never been even approximated until the present generation of American craftsmen. In bronze, details can be delicately wrought, sharply incised or crisply undercut. It is strong and permanent.

With no other metal is it possible to get the range of color that is possible in ornamental bronze. It remains beautiful after years of exposure and need not be painted for it does not rust.

In the last few years bronze craftsmanship in the United States has taken great strides. Today our work is the finest in the world. Architects have found it distinctly to their advantage to make use of this art wherever possible in the buildings they design.

We are constantly in touch with the newest developments in ornamental bronze work and have particularly valuable data on its finishing and maintenance. For full information consult the technical staff of the COPPER AND BRASS RESEARCH ASSOCIATION.

ESTABLISHED 1878

CROWN IRON WORKS COMPANY

Manufacturers of Ornamental Iron and Bronze Work

MINNEAPOLIS, MINN.

Products

ORNAMENTAL IRON and BRONZE WORK.

Scope

Ornamental iron and bronze of every description for buildings.

Facilities

Our plant consists of modernly equipped shops and departments: such as modeling, pattern shop, foundry, machine and finishing shops.

Territory

We are prepared to furnish and erect our work in the United States and Canada.

Service

The Engineering and Estimating Departments are always at the service of architects and contractors.

References

Half a century of uninterrupted business progress, with a reputation for fair dealings and high class craftsmanship.

Following are given a few of the many buildings and architects for which we have furnished ornamental iron, and additional references will be furnished on request.

DETROIT MAUSOLEUM EQUIPMENT WORKS

CHARLES BOVENSIEP, PROPRIETOR

Designers and Manufacturers of U. S. Standard Bronze Doors and Bronze Equipment for Mausoleums; Bronze Tablets and Honor Rolls

Fourteenth Avenue and Baker Street
(Post Office Box 574)
DETROIT, MICH.

Products

BRONZE DOORS for Public and Private Mausoleums.
CAST BRONZE TABLETS and HONOR ROLLS.
CAST BRONZE LETTERS for Building Exteriors in any style, size or shape.

Also manufacturers of Window Grilles and Frames for Glass; Catacomb Handles and Rosettes; Ceiling Hangers; Ventilators; Gates and all Bronze Equipment used in mausoleum construction; Decorative Bronze Work of all kinds; Bas-reliefs.

Bronze Mausoleum Doors

Construction—Doors are all of the "built-up" type construction. Standard thickness is 1 in., although they can also be made 1⅛, 1¼ and 1⅜ in., or thicker.

Bronze sheets not lighter than No. 14 gauge are riveted with $\frac{3}{16}$-in. bronze rivets placed 3 in. on centers to each side of a substantial core or framing of *solid bronze*. Rivet heads are perfectly countersunk on both sides and hand finished smooth with door surface.

Equipment—Cast bronze door frames or jambs are used occasionally, but doors are usually hung direct to granite jambs. Arranged to swing inward or outward as may be required. Hinges are of heavy cast bronze of the pivotal type.

Cast bronze threshold at bottom. Slam bar over center joint. Slide bolts at top and bottom of left-hand door. Heavy handle on each door.

Rear of grille openings is fitted with plate glass shutters fitted with hinges and turn button lockers. A device at bottom of shutters holds them securely at any angle when opened for ventilation.

Lock is of special heavy type, all-bronze, four tumblers, operating with flat german silver keys. Three keys are furnished.

All screws, bolts and expansion jackets are furnished by us.

Finish—Doors are usually finished in a light statuary bronze finish. The door stiles and all flat parts are hand rubbed with fine emery and pumice to a soft satin finish. The cast ornate parts are given a sanded finish with crevices and recessed portions in a darker tone. All outlines are hand tooled clean and sharp.

Workmanship—Doors are constructed by carefully trained skilled mechanics in a thorough, painstaking manner. Miters, joints, and all connections are neat and accurate. Applied ornaments are all secured from rear of door or "blind screwed."

Guarantee—These doors are constructed of best U. S. Standard Bronze. They are absolutely rigid, level and true, and beautifully finished. They are guaranteed to endure practically for all time.

All work is carefully boxed to insure safe delivery.

Service—All work is made to order, in any size or shape. Architects' special designs and ideas will be carefully followed. The usual time required for execution is 4 to 6 weeks.

Our many years' experience in this field is at your service.

Catalogue—On application.

U. S. Standard Bronze Doors for Mausoleums

Continued on next page

Cast Bronze Letters

The style letter illustrated is most generally used and we have adopted it as our standard.

When writing for prices send a scaled sketch showing size of letters desired and length of space where the letters are to be set.

Letters can be made flat face, rounded face, incised face, convex or with any other section.

Usually bronze letters are fitted with bronze washers on the rear, so the backs of letters set ½ to 1 in. from surface of wall.

Architects' details for special designs and shapes will be carefully followed.

General Specifications for Architects—Letters to be cast of best U. S. Standard Bronze of size indicated on plans. To be finished in fine sanded statuary bronze and fitted with substantial bronze anchors on rear for cementing to brick, stone, tile, etc. Special cement and liquid to be furnished for setting.

Spacing of letters to be approved by architect before setting.

-BRONZE- LETTERS-

Illustration No. SW1292

Individual Cast Bronze Letters for Buildings

Standard Roman architectural style. Pyramid section

Cast Bronze Tablets

We make a specialty of bronze memorial tablets. These are furnished in stock patterns or are made from architects' details.

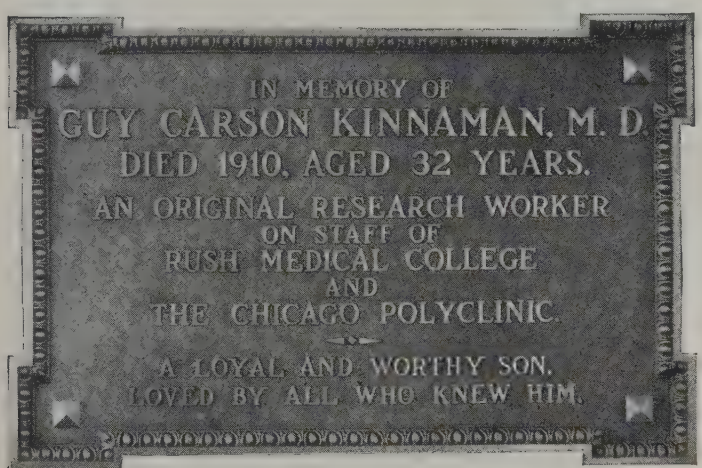

Illustration No. F1501

Typical Design for Bronze Memorial Tablet

Size was 24x18 in. Ornamental border

General Specifications for Architects—Tablets to be cast in one piece of best genuine U. S. Standard Bronze averaging not less than $\frac{3}{16}$-in. thickness in body. Lettering to be heavily raised and of appropriate size and arrangement. Rubbing or full size detail to be furnished for architect's approval.

Face and edge of border and face of lettering to be finished in a fine satin hand burnish. Background or lettering field to have a finely pebbled surface, finished in dark statuary bronze. The outlines of all lettering and borders to be carefully hand tooled clean and sharp. Furnish bronze expansion screws with non-corroding lead expansion jackets for attaching tablet to wall. Heads of screws to be covered with neat rosette with threaded stem entering head of screw.

Note: If tablet is placed indoors, specify "To be heavily lacquered with best quality lacquer." If placed outdoors, specify "To be waxed or oiled."

Note: Background of tablet can be finished in a "Hand Hammered" surface at additional cost.

Illustration No. SW1246

Typical Design of Bronze Tablet for Hotel

Flat raised border and raised lettering. Made in any shape or size desired. This tablet was 36x18 in.

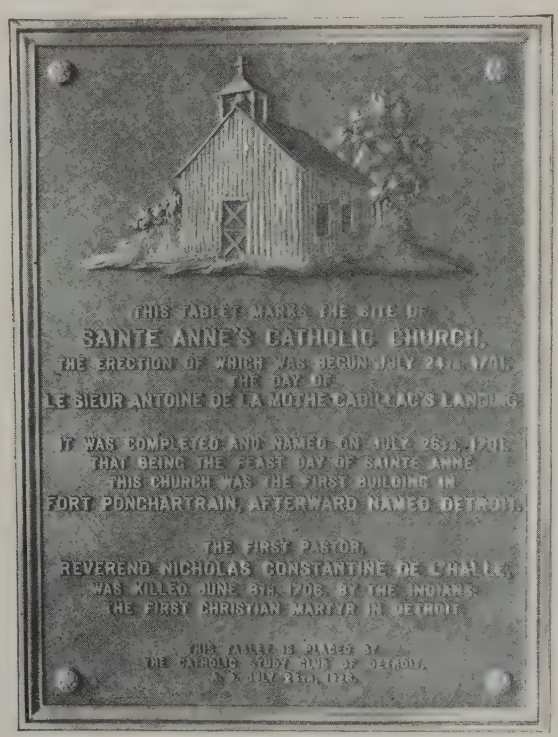

Illustration No. SW1500

Typical Design of Bronze Historical Tablet

Moulded border. Block style raised lettering. Bas-relief of old church. Size was 21x28 in. Any size or shape made to order

Equipment

Our equipment comprises a most completely equipped establishment, devoted exclusively to the manufacture of bronze products.

Facilities

These include designing, engineering and drafting departments, modeling and pattern departments for plaster, wood and metal patterns.

We have also a completely equipped foundry, machine shop, chasing and finishing departments, and a special hardware department.

This complete organization, covering a lifetime of experience and personal supervision, offers expert engineering and drafting service requiring a minimum of supervision on the part of the architect.

FEDERAL BRONZE COMPANY

Architectural Bronze Work of Every Description

TELEPHONE
ASTORIA 9400

Court and Ridge Streets
LONG ISLAND CITY, N. Y.

25 Years' Manufacturing Experience

There is no substitute for experience. This is especially true in architectural bronze work, because when an architect specifies bronze he is calling for the highest grade materials, and therefore requires and expects the highest quality workmanship.

For 25 continuous years the FEDERAL BRONZE COMPANY have been executing architectural bronze work for high class buildings of all descriptions, such as: banks, office buildings, private residences, etc.

Our work is executed from architects' details or from special designs submitted by our own designing department.

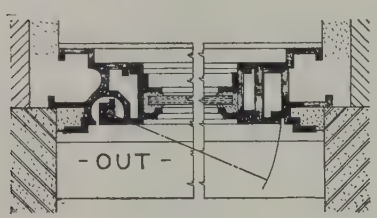
Architectural Bronze Work

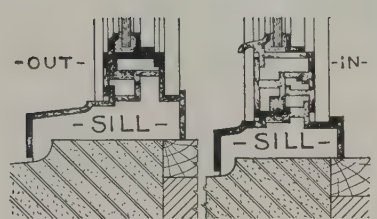
We have executed most every kind of difficult work in bronze for architects and especially solicit the following:

- Entrances
- Marquises
- Store fronts
- Grilles
- Elevator fronts
- Bronze letters
- Counter screens
- Check desks
- Tablets
- Directory boards
- Gates
- Vault grilles

Our Delivery and Erection Is Prompt

We are equipped for rapid production and delivery. Erection can be arranged whenever building is ready.





Typical Details of Federal Bronze Casements

Federal Bronze Windows (Patented)

Made of *heavy gauge extruded bronze* to meet any building requirement.

Our *three-point contact* construction makes these windows absolutely *weathertight and dust-proof.* Our patented *concealed hinges* produce a clean, flush surface, without projections—beautiful and distinctive.

Products

Architectural and Ornamental Bronze and Iron Work, including:

Stairs	Marquises
Railings	Electroliers
Elevator Enclosures	Lamp Standards
Elevator Cars	Gates and Fences
Store Fronts	Bronze Tablets and Signs
Entrances	Bronze Sash and Windows
Bank Counter Screens	Bronze Memorials
Grilles	Memorial Tablets

Facilities

Our plant is one of the largest and is equipped with every modern appliance available for our peculiar needs. Every step, from preparation of details, patterns, models, casting, fitting, assembling and finishing to erection and completion, is handled by our own organization. Only by such unified effort and control can a uniformly high standard for the final product be maintained.

Finishes

Suitable finishes for bronze have long been known and used, but iron has been merely a background or surface for successive coats of paint, to the detriment of its character as metal and the eventual obliteration of all ornamental detail. To obviate this we have developed various finishes in oven baked enamels which, being thin and translucent, protect the surface without obscuring its metallic character.

One of Seven Ambulatory Screens

The seven openings in the semicircular arcade, separating the sanctuary from the ambulatory in the Cathedral of St. Paul are filled with pierced bronze screens each some 10x25 ft. in size. These screens are composed of vertical stiles, transom bar and cornice surmounted by a rich crest. The seven transom panels form a frieze depicting events in the life and ministry of St. Paul, his martyrdom being shown in the illustration. The vertical panels below the transom bar, with four divisions each are filled with medallions representing prophets, apostles, martyrs and doctors of the church, the lower tier just above the choir stalls representing the angel choir.

THE GORHAM COMPANY

BRONZE DIVISION

Sculptural Bronze Founders and Fabricators of Fine Architectural and Memorial Work

576 Fifth Avenue, NEW YORK, N. Y.

EXECUTIVE OFFICES AND WORKS AT PROVIDENCE, R. I.

Products

FINE ARCHITECTURAL and ORNAMENTAL METAL WORK executed in Bronze, Brass, Monel, Silver, Gold and other metals.

Sculpture of any size cast in bronze and expertly finished.

Memorials and mausoleum equipment designed and competently executed.

A partial list of products includes the following:

Altars	Gates
Altar Rails	Guards (Window)
Balustrades	Lamps, Sanctuary
Bank Screens	Lamp Standards
Bulletin Boards	Lecturns
Candlesticks	Letters
Candelabra	Marquise
Canopies	Mausoleum Doors
Check Desks	Pulpits
Counterscreens	Railings
Crosses	Signs
Directories	Store Fronts
Doors	Tablets
Ecclesiastical Wares	Ticket Booths
Elevator Cabs	Windows (Casement)
Elevator Doors	Windows (Double Hung)

Estimating and Advisory Service

Architects and contractors may secure desired information regarding bronze and its uses, suggested treatments, prices, et cetera, upon request.

We will gladly incorporate our standard construction on any layouts sent to us.

Special Service

Architects are invited to use the great Gorham collection of die shapes and ornamental patterns from which desired effects may be secured without cost for special tools and models—usually from metal in stock.

Bronze Tablets

Gorham Bronze Tablets are made to a single standard of excellence. Each tablet is an example of true craftsmanship in bronze.

Fine Bronze Statuary

The Gorham Foundries are the largest in the world devoted to production of sculptural and ornamental bronze.

The Gorham Tablet Book

Contains much helpful information for the tablet designer and full data on colors, letters, borders, fastenings, and the care of bronze. A valuable book for the architect's library. Sent on request.

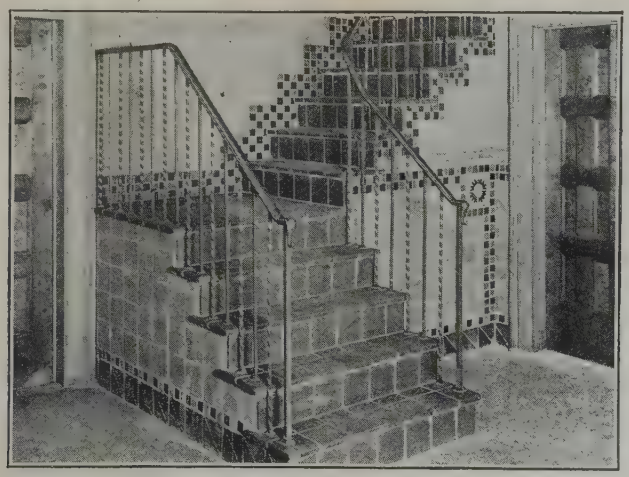
Elevator Enclosures and Cabs

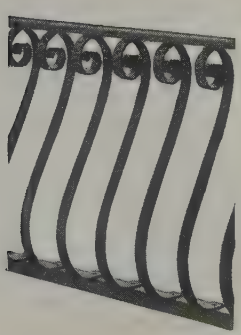
Made up to suit architects' design.

Pipe Railings

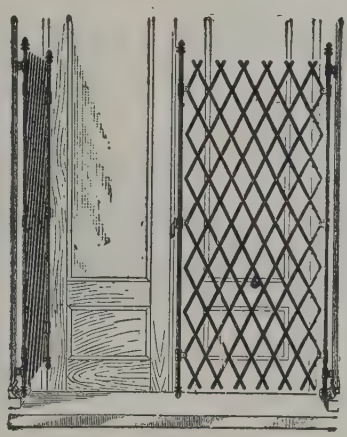
Made up either level or for stairs—of steel pipe or brass tubing.



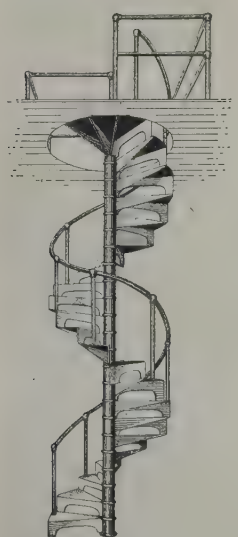
Logan Metal Railing



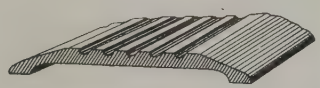
Logan Iron Fencing



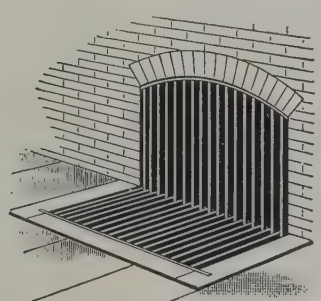
Logan Folding Gate



Logan Spiral Stairs



Logan Threshold
Made of iron, brass or bronze



Logan Sidewalk Grating and Window Guard

Wire Work

Wire Door and Window Guards—Are made any size and of either round iron or channel iron frames.

A special booklet showing different size meshes with wire shown to full size, sent on request.

Wire Partitions—These standard partitions, of No. 10 wire in 1½-in. mesh woven to 1-in. channel frames, are 4x8 ft. in size and are adapted principally to stockroom enclosures. Special sizes can be made.

Standard Step Fire Escapes

These fire escapes are made to comply with any city or state law. Give a sketch of arrangement and give location of windows to be connected.

Special catalogue and specifications of many types sent on request.

Logan Spiral Slide Fire Escapes

This escape, made entirely of steel, consists of a smooth galvanized spiral slide enclosed in a cylinder 5 ft. in diameter, equipped with automatic entrance and exit doors.

It rests on its own foundation and does not depend on the building walls for support. It may be erected either on the exterior of a building, as shown in the accompanying illustration, or incorporated within the walls of the building as detailed below.

Advantages—It has no steps; consequently there is no stumbling or falling.

Being wholly enclosed, it is impossible for rain or snow, smoke or fire to enter.

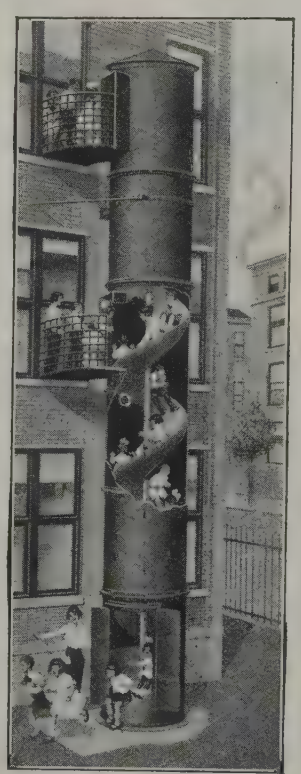
Capacity—Over 150 persons a minute, which is the equal of 3 ordinary stairways.

Specifications—The fire escape shall be the Logan Spiral Slide made by Logan Co., Louisville, Ky., or equal. It shall be placed on a concrete foundation.

The escape proper shall be entirely of steel, 5 ft. diameter, placed as shown on plans, and shall have one entrance at each floor above the first.

The cylinder shall be of No. 12 U. S. Standard gauge sheet steel, for the first 18 in.; the next 6 ft. of No. 14 gauge, and the remainder of No. 16. The spiral slide shall be of No. 16 gauge galvanized sheet securely attached to a center core of 3-in. inside diameter standard black pipe.

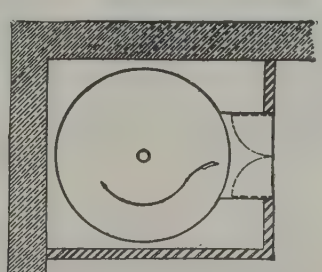
An enclosed vestibule shall be provided at each entrance with entrance doors in two leaves each, arranged to swing in, and provided with torsion springs of phosphor bronze. Doors shall be set away from cylinder far enough to clear same when swung open.



The "Logan Spiral" as Installed on Exterior of Building

Exit doors shall be in two leaves opening outward and provided with brass automatic inside latch with touch-plate to operate by pressure by the smallest child.

The entire escape shall be manufactured in assembled sections about 7 ft. high, with an angle ring at the top and bottom of each section. It shall be set up at the factory to insure proper fitting, and each section properly marked to correspond with a setting diagram to be furnished by manufacturers.



Entrance to Logan Fire Escape—Interior Installation

Makers of Fine Architectural Cast Iron

925 to 939 Broadway

ALBANY, N. Y.

Products

Architectural Gray Iron Castings; Front Work, Entrance and Window Frames; Spandrels; Fascias; Cornices; Marquises, Frames and Pendants; Stairwork; Balusters, Newels, ornamental and plain, Risers and Treads; Columns; Pilasters; Panels; Saddles, Door and Elevator; Cast Iron Grille Work.

Also miscellaneous Castings, such as: Cleanouts, Coalhole Covers, Wheel Guards, Gratings.

Also Ornamental Wrought Iron, including hammered and high lighted finish, required in architectural treatment of building as well as in connection with cast iron work.

Facilities

Fully equipped plant including drafting, engineering and designing department. Pattern department and foundry familiar with all kinds of carved pattern work, intricate cored work for all architectural purposes. Complete fabricating plant for fitting cast iron work with all necessary steel and iron work for shipping work ready for erection if required.

Service

Private siding and location of Albany on direct overnight water route to New York and South, and direct rail routes to New England, West, Southwest and South make delivery convenient and prompt to customers.

Large pattern stock of ornamental details effects economies in design. Ability to furnish plain and carved patterns, fitted as well as unfinished castings make for completeness of service.

Estimates from adequate blue prints quickly furnished and solicited.

Reputation

Over seventy years of experience, and pattern makers, molders and fitters trained for this special work, have made our products well known for the quality of their ornamentation and finish.

N.A.I.W. ELEVATOR DOORS and FRONTS.

Ornamental Metal Work

The NORTH AMERICAN IRON WORKS, INC., is equipped and prepared to produce ornamental metal work in iron, steel, brass, bronze, aluminum, etc., from the plainest to the most ornate designs. The architect is offered a foundry and general metal shop service that is unusual in its broad scope. Distinctive, exacting and quality work is produced as well as the usual routine items of such shops. Architects often desire an unusual piece of work made in a creditable manner, and this company has equipment which enables it to produce work that essentially embodies craftsmanship.

Low operating costs and the convenient location of the plant make for attractively moderate estimates. The combination of highest factory craftsmanship and reasonable cost has been highly favorable to the architect.

Items that have a common use are made in standard styles and sizes and are carried in stock. The company is also prepared to suggest and make up designs for various kinds of work. On request, the Engineering Department will gladly make a study of special conditions, and prepare drawings carrying out every detail with accuracy.

Inquiries and correspondence are solicited with architects, decorators and engineers on their problems concerning any design for any style of architecture or for special purposes.

Decorative Cast Iron Grille for Radiator Screens
Hotel Lincoln, New York

N.A.I.W. Elevator Doors

These doors are made of substantial material to resist heavy duty, are of good architectural design and are sold at a price conforming with the purpose for which they are to be used.

N.A.I.W. Doors are manufactured by a special process from a single plate of metal, formed with stiles, rails and panels to conform with the architect's designs.

Made of One Basic Piece—N.A.I.W. Doors are made in one basic section as shown in Section W, and in 3 basic styles.

Style A, flat face.
Style B, single panel.
Style C, double panel.

These styles can be varied in section to suit architects' designs:

(1) by attaching two sections back to back, panel lined with asbestos and stiles with cork (Section Y); (2) by applying, on the inside face, a steel panel with asbestos lining (Section Z).

Panel offset can be moulded.

Manufacturing Facilities

THE NEWMAN MANUFACTURING CO. has one of the largest plants in the United States devoted exclusively to the fabrication of ornamental brass and bronze. We manufacture anything from a bank installation to memorial tablets and brass theatre rails. Our workmen are highly skilled craftsmen who can take a blue print and materialize it into a work of art.

Estimates—Service

Prompt service on all estimates. Special attention paid to the needs of architects in the way of figures, photos and special data.

The company is always willing to co-operate with architects in the matter of suggesting suitable sizes, designs, etc., and for this maintains a splendid Drafting Department, which is always at your service. Glad to submit suggestive sketches with estimates of cost at any time.

Bank Installations

Newman bank fixtures of brass, bronze and electro plated steel are famous for their quality all over the world. Upon request, we will send blue prints of stock design counter screens with suggestions and estimates of cost. Or, we will quote in accordance with specification on such separate items as grilles, wickets, rails and gates, check desks, doors, safety deposit vault enclosures, cages, signs.

Send for our General Catalog No. 2, our Grille & Wicket Bulletin, Check Desk Bulletin and Marquise Bulletin. They contain a wealth of ideas for architects and general contractors.

Theatre Fixtures

Ornamental bronze ticket offices, extruded bronze and kalamein brass lobby frames, vent grilles, marquise of copper and galvanized steel and brass rails. Plush-covered rails, velour ropes with brass posts and beautiful bronze and brass balustrades. We have specialized in the manufacture of these for nearly a half century.

$20,000.00 Bronze Traffic Tower, Newark, N. J.
Nathan Harris, Architect

Bronze Tablets

Write for Newman's Bronze Tablet Catalogue illustrating and pricing cast bronze memorial tablets, bank signs, school tablets, letters, name plates, etc. This catalogue is a gold mine of suggestions and data for your files.

General Bronze Work

As specialists in designing and executing not only bank installations, but bronze entrances, theatre equipment, church supplies, memorial tablets—in fact anything from a threshold to a hundred thousand dollar installation of ornamental bronze, we welcome the opportunity to furnish suggestions for work that will adequately express the spirit of a designed environment. Our various catalogues will tell you more. Our Engineering Service Department will be glad to co-operate with you and design in detail any specific item you have in mind.

OREGON BRASS WORKS

Manufacturers of Bronze Drinking Fountains

Second and Everett Streets
PORTLAND, ORE.

Bronze Drinking Fountains

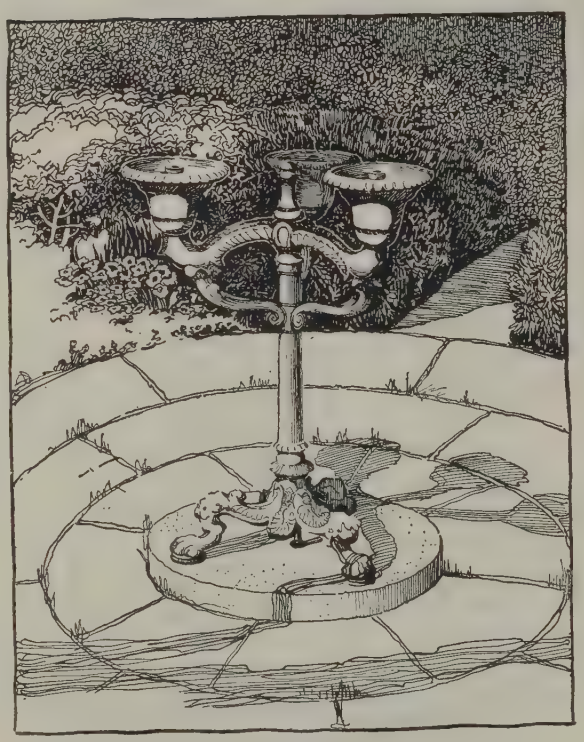
We produce the very finest bronze fountains at from one-third to one-half the normal cost of manufacturing a single fountain of special design.

This saving is effected by manufacturing in quantities, and by thus eliminating the modeling and pattern work (amounting to from one-half to two-thirds of the total cost) necessary in producing fountains each of different design.

It is thereby possible to work out the mechanical design and to improve patterns to give more satisfactory results when a design is being reproduced.

Materials

Only the best statuary bronze or yellow brass castings and brass pipe are used. No iron or steel is used. Castings are made from hand chased patterns to insure fine detail. All coloring is done by chemical processes.



Series P
Design 120

Finish

All standard hardware finishes can be matched. Sample of finish required should be furnished if possible.

Special Designs

Through our experience in specializing in the manufacture of fountains, we are in the best position to execute orders for fountains of special design.

Installation

All fountains are furnished with bolts for fastening and with brass pipe to extend below the floor. Installation should be done by the plumber.

Guarantee

Our fountains are guaranteed in every respect. If not entirely satisfactory, they may be returned at our expense.

Prices

Quotations given upon application. Specify finish desired when requesting quotation.

Also Electrolytic Impressions (Galvanoplastic); Ecclesiastical Fixtures in original designs and authentic reproductions of European Craftsmanship.

Facilities

We have the largest collection, available in the United States, of sculptured models and bronze replicas, enabling us to supply from stock or to order—at the same minimum cost.

Services

Our Service Department will execute from your drawings through all stages to the finished product. Co-operation is given in working up designs, in part or in whole, also in supervising sculptural commissions and in experimental and research work.

Manufacturers Ornamental Iron Work and Building Specialties

CHATTANOOGA, TENN.

Products

Ornamental Cast Iron, Wrought Iron and Light Steel Work for building construction, manufactured to architect's designs; and Standard Iron Building Specialties.

Territory

Location in the heart of the industrial South, with raw materials at hand and excellent railroad facilities, enables us to give quick and competent service throughout the Southern States.

Subcontracts

Much of our work, such as that shown in illustrations, is furnished under contracts covering the furnishing and installing complete in buildings of all ornamental and miscellaneous iron work called for by architects' plans and specifications.

Facilities

Plant consists of modeling and pattern shops, foundry, machine and fitting shops and forge shop, all conveniently arranged and modernly equipped for the manufacture of building iron work and devoted exclusively to this product.

RELIANCE FIREPROOF DOOR CO.

Architectural Ornamental Bronze

73 to 103 Dobbin Street and 80 to 110 Banker Street
BROOKLYN, N. Y.

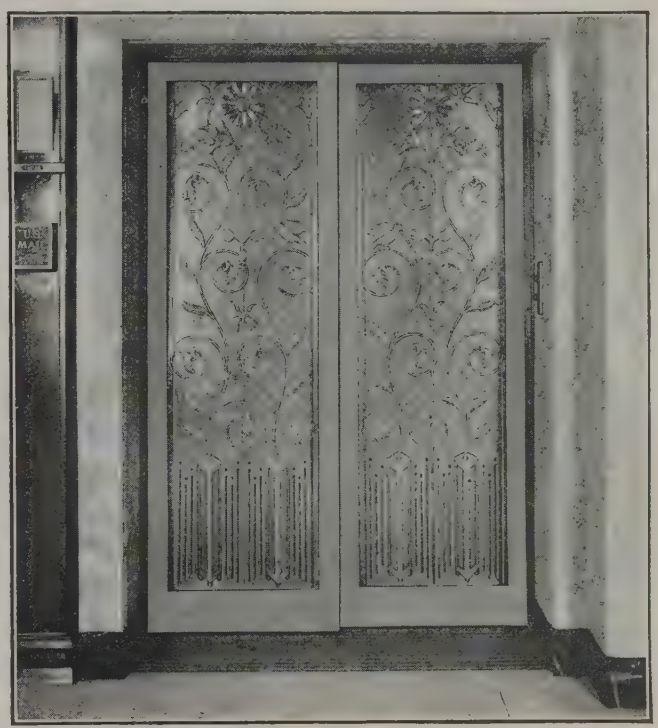
For Representatives, see page A980
For Metal Doors, etc., see pages A980-982

Architectural Bronze Products

We have ample facilities to produce all items of architectural and ornamental bronze work required in the building and allied industries. We have a sales and engineering force competent to handle work in this line of any scope, and our products are built by a force of skilled artisans. Our castings are produced in French sand from highly chased metal patterns or in the lost wax process, reproducing in minute detail ornament from models approved by architects; and we use drawn and extruded sections of heavy gauges only in the working of our architectural bronze products.

We have developed over a period of years types of windows, doors and store fronts, which we manufacture in heavy gauges of bronze and extruded metal and we specialize in the production of the following items:

"Reliance" Extruded Double Hung Windows
"Reliance" Extruded Casement Windows
"Reliance" Complete Elevator Enclosure Units
"Reliance" Extruded Doors and Frames
"Reliance" Extruded Store Fronts



Elevator Doors

Products

Non-climable Chain Link Fences and Gates.
Iron and Wire Fences.
Garden Furniture.
Weather Vanes, Silhouette and Copper.

Also Bank Guards, Builders Iron Work, Catch-basins, Cemetery Gates, Cesspools, Cow Barn Fittings, Fire Escapes, Folding Gates, Garage and Stable Fittings, Garden Ornaments, Sundials, Grilles, Iron Stairs, Spiral Stairs, Manholes, Marquises, Ornamental Balconies, Pipe Railings, Porch and Stair Railings, Roadway Grates, Sidewalk Doors, Steel Doors, Tennis Court Enclosures, Window Guards.

Non-climable Chain Link Fences and Gates

We manufacture all types of non-climable fences and gates of the chain link type. Quotations and further information will be submitted on request.

Iron and Wire Fences

Our iron and wire fences and gates are made in all types and styles and are applicable for all uses, such as factory enclosures, residence purposes, lawns, courts, stairs, porches, cemeteries, fields, farms, etc.

Garden Furniture

Our garden furniture is designed along graceful lines which make our patterns distinctive and attractive. Although ornamental, it is substantially constructed to stand the outdoor weather of any climate. It is all very nicely finished in a soft green but any color requirements can be furnished at a nominal extra cost.

ARCHITECTURAL BRONZE, BRASS, MONEL METAL, GERMAN SILVER and Allied Metals for Banks, Mausoleums, Theaters, Monumental and Memorial Buildings.

Service and Territory

We have a staff of experienced designers and sculptors who are ready at all times to co-operate either in carrying out your suggestions or in preparing original designs.

We are prepared to execute contracts in any section of the United States and elsewhere.

Facilities

We have a modern plant in every respect covering one and a quarter acres. It is fully equipped and organized for the manufacture of ornamental metal work, exclusively. Every known device that makes for mechanical perfection has been installed.

Two of our departments are worthy of special mention—the foundry and the finishing department. Our foundry is equipped to handle the most difficult castings in the false core and lost wax process. Our finishing department is manned with a staff of *specially* trained craftsmen who take particular pride in finishing work in a highly artistic manner and in strict accordance with specifications.

TRADE-MARK

Elevator Entrances and Cars

Made of all-metal fireproof construction throughout.

Can be supplied to suit the hatchway conditions in new or old buildings.

Two-panel Front, Two-speed Doors Open, Showing Car

Furnished in a wide variety of finishes, including: electroplate, enamel bronzes, solid baked colors or grained to match any kind of wood.

Also made in solid bronze.

We build all parts entering into the construction of entrances and cars, including all hardware and mechanism, in our own factory.

This insures perfect operation and undivided responsibility.

Door Construction

Made in single sliding, two-speed, center-opening and other types as required; capable of quiet, high speed operation.

Door panels are made of heavy gauge material, reinforced to withstand the peculiar strains and stresses to which they are subjected.

Engineering Service

The Company's engineers will gladly assist architects and owners in selecting the type of equipment best suited to any type of building. Designs and estimates will also be submitted when requested.

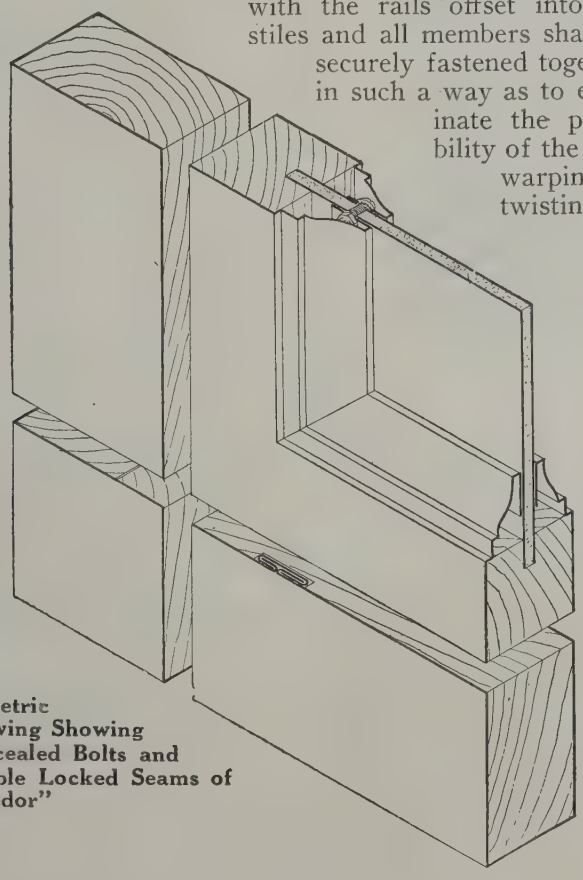
"Leedor" (U. S. Patent No. 1680221), an Improved Metal Covered Door

The "Leedor" is an innovation in metal covered door construction and has been pronounced one of the greatest improvements made since the inception of metal covered doors. Note illustration below showing stile covering and panel moulding formed from one piece of metal—the whole being so formed that when it is slipped over the wood core the moulding is forced tightly against the panel.

Specifications—The metal covered doors shall be "Leedors" as manufactured by the ARCHITECTURAL METAL PRODUCTS, INC., Covington, Ky.

Cores—The wood core shall be of the best grade white pine, thoroughly seasoned and free from loose knots, resin, shakes and dry rot. All core members to be run through a size moulder to insure absolute uniformity. The core members shall then be assembled with the rails offset into the stiles and all members shall be securely fastened together in such a way as to eliminate the possibility of the core warping or twisting.



Isometric Drawing Showing Concealed Bolts and Double Locked Seams of "Leedor"

Metal Coverings—The metal covering shall be of No. 26 gauge galvanized iron sheets. The stile and rail coverings shall be formed with the panel moulding as an integral part thereof. These coverings shall then be neatly fitted over the cores and the panel moulding shall be securely fastened to the panel by means of bolts concealed under the face of the moulding. No fastenings, such as nails, screws, etc., shall appear on the face of the panel moulding.

Gluing—After assembling the cores they shall be thoroughly covered with special glue before the metal covering is applied. After applying the metal covering the doors shall be put under heavy pressure, which is to be maintained for at least eight hours, so that all surfaces of the finished door will be absolutely free of buckles, blisters or waves. All finished doors to have perfectly flat and smooth surfaces and the metal covering must adhere securely and permanently to the cores.

Seams—Metal covering to be securely fastened together at the joints by flat locked seams, sweated with solder and scraped smooth to a flat even surface. In no case shall a seam in the metal occur over a joint in the core.

Painting—All finished doors to receive a shop coat of special gray primer sprayed on.

Underwriters' Label Service—The "Leedor" can be furnished either with or without the Underwriters' Label.

A.M.P. Doors

We also manufacture the A.M.P. Door which has the drawn kalamein moulding applied to the panels with nails or screws. These can be supplied when so specified, but we recommend the "Leedor" as it makes for better appearance.

Copper and Bronze Covered Doors

We are especially equipped to produce copper and bronze covered doors of the highest grade.

Intelligent and careful workmen are in charge of this department and they take pride in producing excellent products. These men are thoroughly experienced in the handling and fabricating of copper and bronze with the result that only the finest finished products are produced.

We have manufactured many entrance doors for some of the finest buildings to the complete satisfaction of the most particular architects.

Bronze doors are covered with No. 18 B.&S. gauge with extruded or hollow bronze mouldings, producing an effect similar to hollow bronze, at a much lower cost.

Hollow Metal Frames

We are producing formed steel frames and can supply them in connection with our doors when required. These can be furnished either with or without the Underwriters' labels.

ART METAL CONSTRUCTION COMPANY

Hollow Metal Doors and Trim

JAMESTOWN, N. Y.

For Branch Offices, see page C3784

TRADE-MARK

Products

HOLLOW METAL DOORS and BUILDING TRIM; ELEVATOR, STAIR and DUMBWAITER ENCLOSURES; CORRIDOR and OFFICE PARTITIONS and CABINET WORK in STEEL and BRONZE.

For Steel and Bronze Interior Equipment, see pages C3784-3787.

Facilities

Largest and most modernly equipped plants devoted to the manufacture of hollow metal products and building equipment.

Service

Main and branch offices maintain competent engineers, whose services are free to architects, engineers, and builders.

Materials

All materials used in Art Metal products are the best of their respective kinds, for their particular purposes. All steel and ingot iron are the best grades commercial furniture stock of U. S. standard gauge. All bronze is best grade commercial stock Brown and Sharpe gauge, of suitable hardness and uniform color.

Workmanship

Work is executed by craftsmen, employing the latest principles of construction and most modern methods of manufacture.

Standards

Our construction is in accordance with the "Simplified Practices" adopted by the industry and approved by the Federal Dept. of Commerce, effective August 1, 1928.

Art Metal Bronze Doors, Buckeye Savings & Loan Association, Columbus, Ohio

General Description of Steel Products

Doors and Sash—Stiles and rails are formed of No. 18 gauge stock with cold drawn panel mouldings securely keyed thereto. Stiles are provided with compressed cork inserts. Joints are fitted, reinforced, welded and dressed to produce invisible connections.

Metal panels consist of two plates of No. 20 gauge stock and ¼-inch heat retarding insulation.

Glass panels are retained by removable cold drawn moulding frames closely fitted and secured to panel mouldings by No. 6-32 countersunk oval head screws.

Muntins are constructed of cold drawn interlocking shapes fitted and welded to panel mouldings.

Astragals are of cold drawn interlocking shapes welded to stiles.

Jambs—For openings in walls up to 7½ inches thick, jambs are formed of No. 18 gauge stock; over 7½ inches No. 16 gauge with ½-inch plain or moulded stops for regular units and ⅝-inch for Fire Underwriters' units. Jambs are secured to bucks by No. 8-32 screws.

Casings—Of No. 18 gauge cold drawn shapes, corners accurately mitered, welded and dressed to produce invisible joints. Casings are secured to jambs by concealed method.

Pressed Steel Bucks—Of No. 14 gauge stock provided with anchor retainers and plaster bonds, corners accurately fitted, reinforced and provided with interlocking screw connections. Temporary spreaders are of wood and permanent spreaders of No. 14 gauge channels 2x¾ in. with No. 12 gauge gussets secured to bottom. No. 18 gauge corrugated adjustable anchors are furnished for each 25 inches of opening height.

Bucks for walls of plaster block construction are furnished with struts when called for. Struts are of ¼x3-inch bars having No. 12 gauge flanged gusset ceiling connections.

Bucks for opening more than 3 feet 6 inches wide in tile or brick walls are furnished with arched masonry supports when called for where lintels are not provided. Supports are of 4-inch by No. 12 gauge stock welded to head at ends.

Frames—Combination buck and jamb frames are formed of No. 10, 12, 14 or 16 gauge stock. Corners accurately fitted, welded and dressed to produce invisible rigid joints. Trim members are pressed into frames or of drawn shapes applied by concealed method. Frames are provided with spreaders, anchors, struts and masonry supports as specified for bucks.

Trim Mouldings—Chair rail, staff or scribe, picture and wire mouldings are of No. 18 gauge cold drawn shapes, secured to walls by concealed method.

Bases—Constructed of No. 18 gauge stock with plain or moulded profiles, and secured to walls by concealed method. When called for, bases are fitted with bronze sanitary coves.

Window Trim—Jambs and mullions are of No. 18 gauge stock, plain or paneled, and provided with adjustable moulded stops secured by No. 6-32 countersunk oval head screws.

Stools—Of No. 16 gauge stock with returns accurately mitered, welded and dressed. Stools are secured by No. 8-32 countersunk oval head screws.

Continued on next page

Casing and Aprons—Of No. 18 gauge cold drawn shapes with corners and returns accurately mitered, welded and dressed, and secured by concealed method.

Partitions—Of sectional type with units of sizes allowing for flexibility of arrangement. Units proper are constructed of formed and drawn shapes reinforced and so assembled as to produce invisible connections.

Owing to the perfected construction, installation is simple and can be performed economically and expeditiously.

Hardware—Hollow metal work is prepared and reinforced for the proper reception of all hardware and appliances. Ordinarily the hardware is furnished under separate contract, but applied at our plant.

Bronze Work

The foregoing description covers our standard products in steel. Bronze work is executed similarly, except that materials are two gauges heavier, joints are made by riveting, screwing and brazing, and finish is produced in accordance with standard methods for durability and desired effects.

Finish

Material is thoroughly cleaned, primed and filled, followed by subsequent coats as required to produce a durable finish of color selected. Each coat is uniformly applied, baked, and sanded, with final coat rubbed to an eggshell gloss.

The following finishes are standard and grouped according to class:

STANDARD FINISHES OF ART METAL DOORS

Class	Finish	Class	Finish
No. 1	Olive "F"	No. 3 (cont.)	White Ivory Cream
No. 2	No. 29 Brewster green No. 30 Stone green No. 51 Medium green No. 52 Brown No. 53 Tan Maroon Black	No. 4	No. 36 Dark mahogany, crotch grain No. 61 Brown mahogany
No. 2½	No. 1 Dull bronze, light No. 2 Dull bronze, medium No. 3 Dull bronze, dark French gray	No. 5	No. 57 Plain oak, medium No. 58 Quartered oak, medium
No. 3	No. 36 Dark mahogany, straight grain No. 36B Light mahogany, straight grain No. 54 Gold bronze No. 55 Silver bronze	No. 6	No. 59 Light American walnut No. 60 Dark American walnut Circassian walnut
		No. 7	No. 56 Verdigris green, stippled No. R-228 Mottled green, stippled

Fire Underwriters' Requirements

The National Board of Fire Underwriters have tested and approved Art Metal products, authorizing their labels for the following situations:

Class "A," Units in Division Walls Between Separate Buildings or Sections of Buildings—Limitations: swinging type; single doors for openings not exceeding 4x7 feet, and doors in pairs not exceeding 5x7 feet, all steel with approved hardware.

"Class B," Units in Enclosures to Vertical Communications Through Buildings—Limitations: swinging type; single doors for openings not exceeding 4x10 feet, and doors in pairs not exceeding 8x10 feet, all steel with approved hardware.

Class "C," Units in Corridor and Room Partitions—Limitations: swinging type; single doors for openings not exceeding 4x10 feet, and doors in pairs not exceeding 8x10 feet, with or without panels of standard wire glass. Exposed area of individual lights not exceeding 1296 square inches.

Class "D," Units in Exterior Walls Subject to Severe Fire Exposure—Limitations: swinging type; single doors for openings not exceeding 4x10 feet, and doors in pairs not exceeding 6x10 feet, with or without panels of standard wire glass. Exposed area of individual lights not to exceed 720 square inches, lights not to exceed 54 inches in height.

Also General Trim for office buildings, hotels, apartments, hospitals, schools, banks, theaters; Hose Cabinets and Switch Box Panels.

TRADE-MARK

Quality—Dahlstrom products are internationally known. Only the *expert* workmanship and first class materials entering into their manufacture can sustain this reputation.

Classification of Finishes—In order to make it clearly understood that the kind of finish required will affect prices, a list of standard classifications is given below.

Class A—Plain colors finishes such as: No. 10 dark green; No. 11 olive green; No. 15 Maroon; No. 17 chocolate; No. 19 dull black; No. 30 sea green; No. 33 statuary brown; No. 47 bottle green; No. 48 slate; No. 49 navy gray; No. 50 dark gray; No. 51 quaker drab; No. 52 medium brown.

Class B—Plain color finishes such as: No. 13 white; No. 18 French gray; No. 34 pearl gray, cream, light blue and light gray.

Class C—Grained and stipple finishes such as: No. 26A verde antique stipple; No. 28 green stipple; No. 42 medium brown stipple.

Class D—Grained and stipple finishes such as: No. 1 light mahogany; No. 2 tuna mahogany; No. 3 dark mahogany; No. 8 birch; No. 36 bronze stipple, statuary; No. 38 bronze stipple, black; No. 46 mottled Egyptian green; No. 53 gumwood; No. 54 American walnut.

Class E—Grained and stipple finishes such as: No. 4 medium oak; No. 5 light oak; No. 6 dark oak; No. 7 circassian walnut, light; No. 9 ash; No. 31 dark circassian walnut; No. 35 natural bronze stipple; No. 37 bronze stipple, mottled; No. 40 bronze stipple, mottled verdigris; straight oak and pine.

Class G—Grained and special finishes such as: fumed oak; silver oak; special crotch mahogany; Australian mahogany; teakwood; burl walnut; also marble, inlay work and special bronzes.

Dahlstrom Metal Doors and Trim

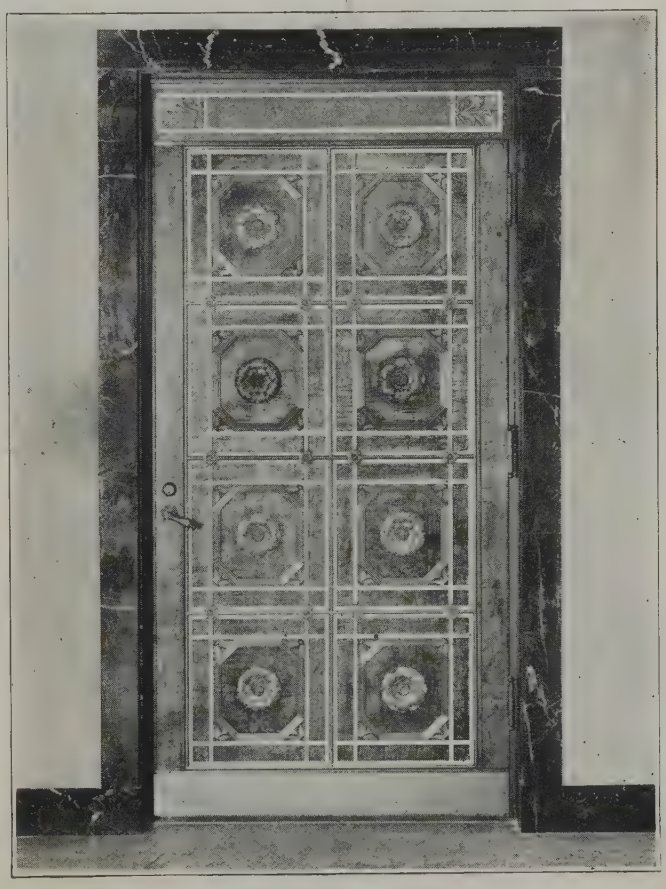
Design—Original and largest manufacturers of metal doors and trim in the world. Metal doors were originated by the founder of this Company. Twenty-five years of designing and manufacturing doors and trim to meet various conditions have given Dahlstrom products the well-earned title of "The Specified Standard."

Construction — Dahlstrom Metal Doors and Trim have during a quarter of a century proved their fire retarding value. No portion of the product can burn.

All joints are carefully welded. Reinforcements are also welded to the construction members. The design of Dahlstrom Metal Doors makes for rigidity, stability, fire protection and elegance.

Door frames are fabricated from Nos. 16 to 11 gauge metal according to the size of the opening and the service required.

Finish—All surfaces are thoroughly cleaned before finish is applied, all materials are carefully tested in our laboratory. Each coat of paint or enamel is carefully baked and properly treated to secure the superior finish for which Hahlstrom products are noted. The same care and attention is given all finishes whether plain colors, stipples or reproductions of wood graining. All material for finishing is carefully tested in our laboratory.



Corridor Door, The Times Union Building, Rochester, N. Y.

Specifications

Complete specifications have been prepared covering the entire field of hollow metal. Separate specifications covering elevator entrances are also available. We shall be glad to send these specifications to architects on request.

New-Improved Dahlstrom Partition

Rapidly changing business conditions, expansions and mergers seem to be the order of the day. Departmental organizations are replacing the one-man office force. Single floors expand into whole buildings.

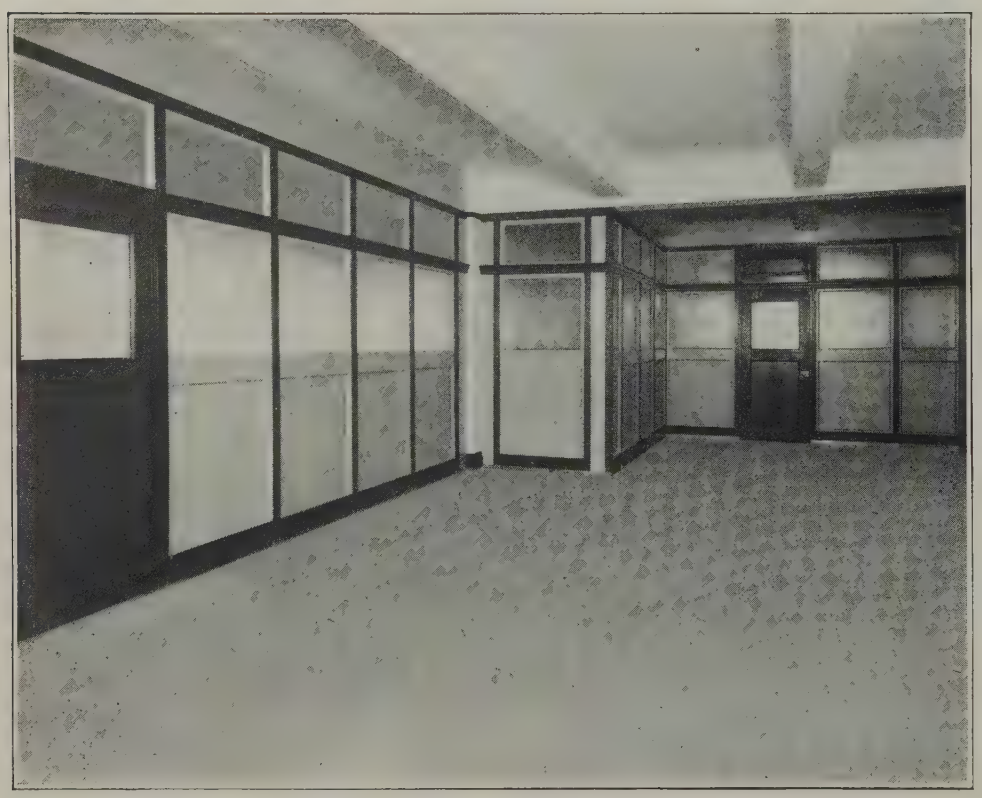
Partition walls are constantly being moved to meet tenant requirements. Old tenants must be satisfied and accommodating arrangements must be made for new ones. Tile and plaster partitions are not flexible enough to meet these rapidly changing conditions.

The "loft" type of building construction has done much to meet these rapidly changing conditions. They can be easily divided to meet tenant requirements.

To further facilitate meeting these requirements, the flexible partition has been developed.

For a number of years Dahlstrom has manufactured metal partition. Now comes the New-Improved Dahlstrom Partition, based on years of experience and experimentation. It meets every requisite necessary in subdividing floors and departments.

Type G-52 Dwarf Height Partition



Type G-52 Ceiling Height Partition

It is flexible and easily set up or taken down. Doors and panels may be interchanged. Cross rail heights can be readily changed. It has a telescoping wall filler which minimizes the cutting of fillers on the job.

It is rigid. It will not vibrate and chatter. The same principles used in building steel skeletons of modern buildings have been applied to the New-Improved Dahlstrom Partition.

This partition is designed to carry the wiring so necessary for convenient outlets. The cornice construction is such that wires can be carried concealed and fed down through pilasters to any receptacle outlets or switches. This is done by removing one side of the cornice. A simple fastening arrangement holds the cornice moulding.

The New-Improved Dahlstrom Partition is a fire retardant because there is nothing in its construction to burn.

Elevator Entrances

Just as the internal combustion engine made the automobile possible, so the development in elevator engineering made the skyscraper possible. At the same time came the fire menace and hazard in the skyscraper. The elevator shaft proved to be a veritable flue or chimney with a natural draft, thus making a favorite haunt for fire. Fire could quickly travel through the open shaft and rapidly spread from floor to floor.

The timely appearance of Dahlstrom Metal Doors and Trim provided a solution to this problem. Elevator shafts could be enclosed, thus preventing fire on floors below for using this means of travel through the building. It is a pleasure to check the efficient service still being rendered by early Dahlstrom installations, even those of more than twenty years ago. Ninety per cent of the early Dahlstrom installations were elevator entrances.

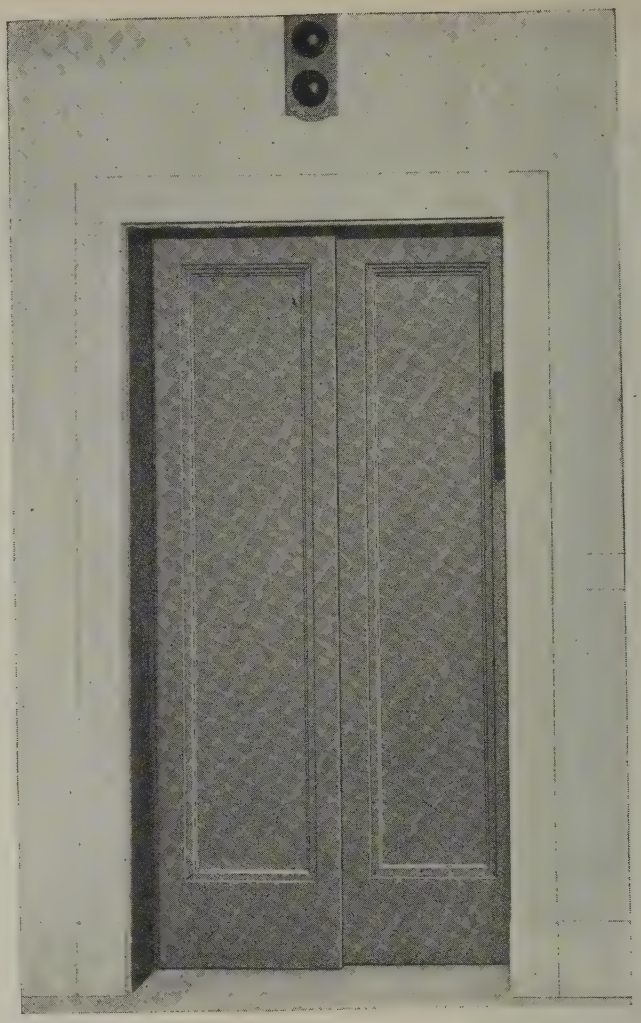
Dahlstrom Elevator Entrances receive the same high standard of careful workmanship and finish for which all the Dahlstrom products are noted. The first Dahlstrom installations are still in use.

The weight of the door permits easy operation, while the general design provides fire protection and beauty. A beauty in keeping with the high type of architecture brought about by the large modern building.

The development of the elevator and the shaft which incloses it has kept pace with other features of building construction. In this connection the modern elevator has played an important part.

Contrast the old open grille work around elevators with the modern installations of Dahlstrom Entrances and the vast strides made in recent years will at once become apparent. It is a distinct source of pride with us that it fell to our lot to pioneer this important achievement in modern building.

That we did pioneer this development becomes very evident when consideration is given to the fact that the major portion of our early installations were door units for stair wells and elevator shafts and those installations date back to the very inception of the metal door industry.



Typical Dahlstrom Elevator Entrance, Prudential Building, Newark, N. J.

Years of experience in designing, manufacturing and installing elevator entrances in buildings of many different types with their great variety of shaft conditions have given Dahlstrom valuable data as to the most suitable type of entrance necessary to secure the most efficient service.

The Dahlstrom Engineering Department will gladly work with you in designing entrances to meet your requirements.

Dalstrom Elevator Entrances with Cast Bronze Mouldings and Medallions, Breslin Building, Louisville, Ky.

Continued on next page

Decorative Elevator Entrances

The general trend in building decoration is toward color and decorative art. This has called for many drastic changes in elevator door design. Etched panels, colored glass, fused enamels on bronze, cast bronze ornamentation and even hand-painted designs and motifs. For some time Dahlstrom has been furnishing elevator fronts designed along these lines.

Etched panels with rich, luxurious backgrounds and for the more ornate, vitreous enamel medallions, mouldings and motifs on bronze have been worked out for ground floor elevator entrances.

These designs are pleasing to the eye and may be made to harmonize with the lobby decorative scheme.

Dahlstrom artists and engineers will gladly co-operate with architects and designers in designing elevator entrances in plain or in decorative designs.

The process employed in the use of vitreous enamel is unique in that it utilizes a special bronze which permits the application of vitreous enamels, which are fused into the metal at 2000° F. Unlike the well-known, so-called polychrome treatment of metals, this treatment is as permanent as the bronze itself. It provides for a wider range of color and detail and makes possible an economical combination of Dahlstrom doors with decorative panels.

The Favrille glass designs are used in connection with appropriately designed saw-pierced etched metal inlaid with the glass. The panels can be designed to conform to any decorative scheme involving style as well as color.

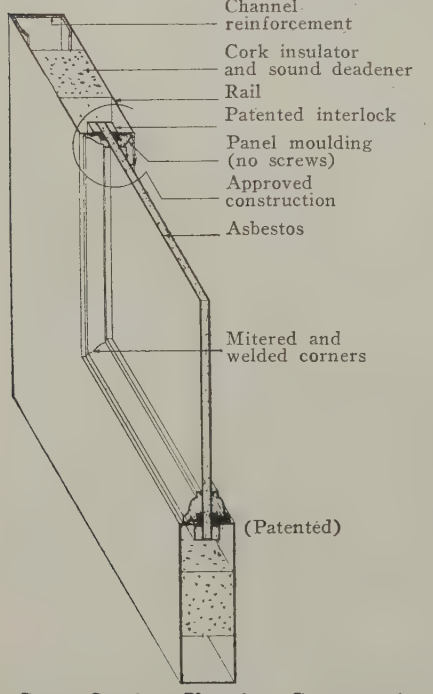
Improved Facilities

We have recently moved into our new factory at Clifton, N. J. With the additional facilities which this new plant affords, we are exceptionally well equipped to handle large jobs.

Our New Factory at Clifton, N. J.

Betz Bros. Hollow Metal Doors

Our doors are built with continuous interlocking and reinforcing channels of special design which clip the panel mouldings and lock the panels to the stiles and rails without the use of screws. This key-lock construction is a patented feature which provides great structural strength and makes these doors unusually efficient fire retardants.



Cross Section Showing Construction

These doors are manufactured from No. 16 and No. 18 U.S. Standard gauge all open hearth process, full cold rolled, full pickled, patent leveled, re-squared, re-annealed and oiled furniture steel.

Properly designed reinforcing plates and bars are electrically spot-welded in place to take care of the attachment of hardware.

Stiles and rails are carefully welded together, using both acetylene gas and electric processes.

Panels and panel mouldings are keyed to the stiles and rails by means of the patented construction described above. Mouldings are No. 18 gauge cold rolled steel; all panel mouldings are mitered at corners and gas-welded. For glazed panels, the loose stops may be either snapped in place with concealed fasteners or attached by means of oval head machine screws.

Stiles, rails and panels are insulated with sound deadening cork, fibre or asbestos.

Doors are finished to our standard sample colors and finishes, the baking being accomplished at temperatures from 280° up, as the particular jobs may require.

Approval of Underwriters' Laboratories, Inc.—These doors have been tested and listed by the Underwriters' Laboratories, Inc. Labels will be furnished when specified.

Rolled Combination Bucks, Jambs and Trim

Our rolled combination bucks, jambs and trim are made in 16 and 18 U.S. Standard gauge, bright cold rolled, full finish strip steel. The workmanship on these combination bucks is of the highest grade and in keeping with the best grade of hollow steel materials. They are furnished finished, and protected, and are especially recommended for tenant changes.

Cabinet Jambs and Trim

Our cabinet jambs are made of No. 18 U.S. Standard gauge all open hearth process, full cold rolled, full pickled, patent leveled, re-squared, re-annealed and oiled furniture steel; with plain or moulded stops and reinforced for hardware as required. Trim may be secured to frames by either concealed spring clips or exposed oval head machine screws.

Hollow Metal Door with Pressed Steel Buck

Mouldings

We are equipped to manufacture all kinds of metal mouldings.

Store Front Shapes

We manufacture a variety of standardized store front shapes. Details and quotations on request.

Complete Elevator Enclosures

We have developed fifteen types of treatments for elevator openings. These complete treatments include combination buck, jamb and trim units, closure mouldings, toe guards for shaft sides of doors, cast iron or bronze sills, brass or bronze knobs and lock sets, Rixson or ball bearing hinges; complete doors, including glass and glazing, etc.

Continued on next page

We will be glad to co-operate with architects, contractors and owners in the design and execution of work of this character.

Steelbilt Heavy Elevator Doors

These doors are made of 12 and 14 gauge seamless tubing, with the necessary hardware reinforcements, ⅜-in. panels made of two sheets of 18 gauge steel, with ¼-in. asbestos filling between. The door moulding is held in place by concealed fasteners, and glass moulding held in place with screws as required. All joints solid electrically welded, and ground smooth. The entire door is hermetically sealed. Doors can be furnished in a variety of designs.

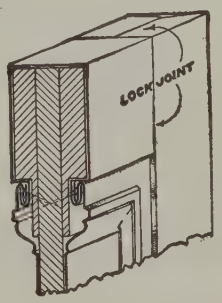
Kalamein Doors

These doors are constructed with a wood core over which sheet metal is applied. This kalamein will not warp or bulge, as expansion and contraction are allowed for in a special lock seam.

They can be furnished in a variety of stock designs.

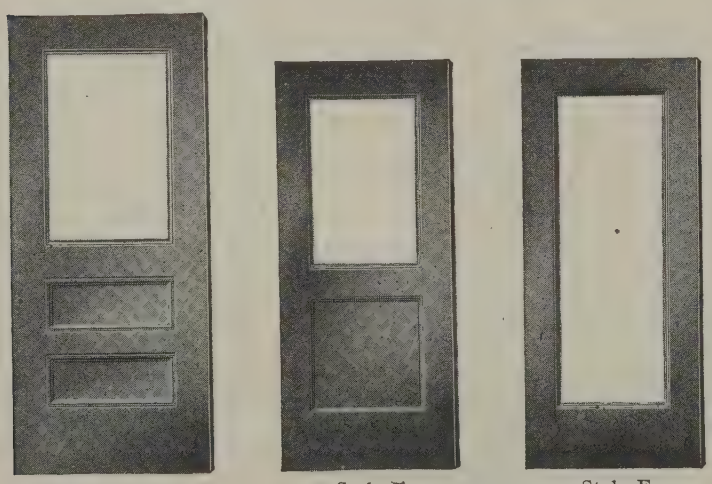
Catalogue No. 53 sent on application.

In addition to doors, kalamein trim, mouldings, muntin bars, astragals, and stop strips are manufactured by this company in either stock or special designs.



Detail of Construction for Kalamein Door

Specification Data—Core of thoroughly kiln dried lumber, tongue and groove joined, and clinch nailed. Stamp panels and rails in separate pieces, of metal specified. All joints are blind nailed and lock seamed securing covering to core in a manner which allows for expansion and contraction of metal. Doors exposed to weather covered with galvanized steel or sheet copper. Interior doors covered with Armco steel, bronze or copper. Steel doors finished with one coat gray priming paint, or baked enamel in imitation of wood, to be specified.



Style B Style E Style F

Kalamein Doors, with Glass Panels

Hollow Metal Doors

Made to architect's designs in special finishes permitting a wide range of individual expressions, or in stock patterns and standard finishes. Thoroughly insulated throughout to insure an efficient fire retardant and to prevent metallic sound. The construction obviates necessity of installing jamb during erection of walls, and permits hanging and adjusting of doors independently of frames. The Underwriters' Laboratories, Inc., have tested and approved these doors and their label is affixed to them, for all classes of openings.

Complete information should be given when asking for estimates, as they are based on the requirements of each particular installation.

Catalogue No. 53 sent on request.

Corner Section Hollow Metal Door

Specification Data—Doors of highest grade No. 18 gauge Armco open hearth steel specially treated. All surfaces true, level, and free from all imperfections. Parts interlocked and welded with invisible seams and joints. Insulate stiles, rails, and panels throughout with asbestos. Apply baked enamel finish in imitation of wood specified. Frames of No. 14 gauge steel, welded at joints to form one piece. Attach to walls by means of adjustable anchor plates. Jambs, furnished in separate pieces, fit over frames.

Elevator Enclosures, Doors and Cars

Many years' experience and a completely equipped plant enable us to produce any type of elevator enclosure in bronze, or steel. Several of our stock designs are shown here. Our engineering department is ready at all times to assist and co-operate with you in designing enclosures for special conditions.

We make enclosures of steel diamond mesh, steel square mesh, kalamein and hollow steel construction with polished wire, glass or steel bar panels, made in any wood finish desired.

Standard doors are made in the following types: single sliding, two-speed sliding, two-thirds opening sliding, and combination sliding and swinging. Doors furnished complete with hardware.

Products

Metal Covered Doors with photographic graining to match wood doors; Metal Covered Double Hung Windows both with and without integral weatherstripping; Bronze and Copper Entrances; Metal Covered Dumbwaiter Units of all types; Elevator Enclosures, including sills and hardware complete; Tin Clad Fire Doors and Shutters with hardware.

For Sliding Door Hardware of all types, see pages B2323-2327.

Facilities and Shipping

This company is prepared to handle orders of any size for all parts of the country. A large modern plant, with direct rail connection, insures the fabrication and delivery of all work promptly and in a satisfactory manner.

Metal Covered Doors and Trim

Coburn metal covered doors are furnished both labeled and unlabeled for use in office buildings, hospitals, public buildings, hotels, theaters, stores, residences, etc. These include stair, elevator, fire escape, tower, corridor and partition doors for general interior work, and entrance doors in copper, bronze, and brass.

Coburn standard doors are made with kiln dried white pine cores; rails are tenoned into stiles; panels are grooved into stiles and rails. Cores are covered with kalamein or galvanized iron, bronze, copper or brass.

For standard details and application of labeled and unlabeled doors showing mouldings and panels, see drawing No. K1.

Underwriters' Labeled Kalamein Doors

Coburn underwriters' labeled kalamein doors when installed as specified below for the purposes indicated, will give maximum protection and procure minimum rates for the insuring of the building and its contents.

Standard Stair and Elevator Doors—Labeled for single doors up to 48 in. wide and in pairs up to 96 in. wide. Panels to be solid. Hung on angle iron frames for brick walls and channel frames for tile walls or for metal lath and plaster partitions, with strap hinges and latches or butts and lock sets. Doors to stairs should be made self-closing. Doors can not be hung on metal covered jambs.

Fire Escape and Tower Doors—Labeled for single doors up to 4 ft. wide, 10 ft. high and for pairs up to 8 ft. wide, 10 ft. high; can include glass panels not exceeding 720 sq. in. in area. Must be hung in the same manner as stair and elevator doors.

Corridor and Partition Doors—Labeled to receive 9 sq. ft. of wire glass. Labeled up to 4 ft. wide, 10 ft. high for single doors and 8 ft. wide, 10 ft. high for pairs.

Specifications for Kalamein and Metal Covered Work

The following specifications are applied to the manufacture of all Coburn metal covered work and comply strictly with the most approved methods of construction for labeled and unlabeled doors and trim.

Cores—All woodword used in the manufacture of doors and window frames, jambs, doors, sash and trim to be seasoned, clear, kiln dried white pine. Stiles more than 6 in. wide to be built up of strips glued together. All door and sash members to be mortised and tenoned together.

Trim—Trim for doors to be shipped knocked down and fitted in the field so that any irregularities may be taken up at the job.

Metal—All metal covering of galvanized iron, furniture steel or kalamein to be of gauges ranging from 18 to 26; copper to be from 16-oz. to 32-oz.; bronze from 16-gauge to 24-gauge. Metal to be drawn on to wood cores through steel dies. Furniture steel or kalamein can be painted in color or grained to match any type of wood door; copper and bronze to be finished antique, statuary bronze to be finished antique, statuary bronze or any suitable design as required.

Covering of Cores—*Unlabeled Doors*—The metal is to be applied directly over the cores. All metal must fit closely to the wood cores. All surfaces and edges are to be straight and true; mouldings to be as per details. Bench marks are to be avoided as much as possible and cut ends at miters are to be covered with the same metal as used on mouldings. Thickness of door is 1¾ in.

Labeled Doors—Are to be covered in the same manner as the unlabeled doors except as shown on detail on following page. Thickness of door is 1⅞ in.

All joints of metal to be locked and soldered so that no moisture can gain entrance to the cores.

Steel Bucks and Trim

Our steel bucks can be furnished with integral trim, in 16 or 14 gauge. All other gauges as required can be furnished in flat hospital type bucks to suit specifications.

Py-ro-no TRADE MARK REGISTERED

Asbestos Interlined FIRE PROOF DOORS

Process of Construction

The PYRONO process is a mechanical method of fireproofing wood cores in the manufacture of doors and trim.

In PYRONO construction, cores of non-resinous wood are used and these when assembled are covered with pure, long fiber asbestos sheathing mechanically bonded to their surfaces, excluding oxygen, thus preventing ignition and assuring against spread of flame from the place of origin to other parts of a building—the one essential province of a fire door.

Appropriate Use

PYRONO doors are used for stairways, elevators, corridors and partitions, in office buildings, hotels, hospitals, apartments, schools, dormitories and similar types of fireproof buildings.

Fully Tested

PYRONO, first introduced in 1910, has fully demonstrated in official tests and actual fires its perfect efficiency as a fire retardant.

Designs

Flush doors with or without inlay. Panel doors, any arrangement of panels. Sash doors with glass lights not exceeding 720 square inches. PYRONO doors and trim furnished in all cabinet woods used in interior finish.

Specifications

Pyrono Panel Doors—Fireproof paneled veneered doors to be constructed as follows: Stile and rail cores to consist of narrow softwood strips, thoroughly kiln-dried, not more than ⅞-in. thick and glued together under pressure. This wood core to be covered on face and edges with pure long fibre asbestos sheathing thoroughly glued and indented with not less than twenty-five indentations to the square inch. Each indent to be perforated at its base to perfect the glue bond between core and veneer. Hardwood veneer as specified to be applied to face of such stiles and rails, and edge strips to match veneer to be applied to all edges.

Panels shall be laminated seven-ply with grain crossed on alternate wood plies. The ply next to the core on each side shall be pure long fibre asbestos sheathing thoroughly glued and indented to the core as indicated for stile and rail construction. Face veneer to be as specified by architect. All panels to be not less than ¾-inch thick.

All stile and rail joints to be of mortise and tenon construction.

All doors shall be hand or belt smoothed and entirely free from cross grain sander scratches.

All doors to receive one coat of stain and shellac (including filler if necessary), or lead and oil priming before shipment.

Pyrono Flush Doors—Fireproof flush veneered doors to be constructed as follows:

Cores to consist of narrow softwood strips, thoroughly kiln-dried, not more than ⅞-inch thick, glued together to form stiles, cross rails and flush panels, and framed together with mortise and tenon joints. This wood core to be covered on face and edges with pure long fibre asbestos sheathing thoroughly glued and indented to the core, with not less than twenty-five indents to the square inch. Each indent to be perforated at its base to perfect the glue bond between core and cross band.

Hardwood edge-strips of same wood as face veneer to be applied on all edges and door to be completed by application of ⅛-inch cross-band and face veneer not more than ⅛-inch thick.

All doors to be hand or belt smoothed and absolutely free from machine or sander marks that will appear on application of stain or varnish. All doors to receive one coat of stain and shellac (including filler if necessary), or lead and oil priming before shipment.

KALAMEIN PRODUCTS

TRADE-MARK (Registered)

"Empire Commercial" Metal Covered Doors

Through years of specialization in the manufacture of metal covered work, we have evolved a product in which we take just pride—the "Empire Commercial" metal covered door, suitable for any class of fireproof work.

Details—***Cores***—Sound kiln dried white pine milled in one piece, sanded and finished accurately, for cores of stiles and rails.

Covering—Long terne or galvanized or furniture steel of No. 24 gauge. Drawn on through steel dies; sharp angles and arrises; tight and free from waves and buckles.

Panels—To be three-ply laminated pine meeting requirements of all city and state building departments.

Assembly—Doors are mortised and tenoned, wedged and glued or doweled. Seams soldered and scraped by our own process, producing a perfect and smooth surface. Under ordinary use seams are guaranteed not to split.

Finish—All material receives one coat of special metallic primer.

Underwriters' Labeled Doors

Paneled metal clad swinging doors may be used for openings in vertical shafts, corridor or room partitions, exterior walls, and fire escape exits when provided with special hardware. Size when mounted singly, not exceeding 4x8 ft. In pairs, not exceeding 7x8 ft. Doors must be hung to angle iron, channel iron or hollow metal jambs.

Empire Metal Covered Windows

Double hung or casement type windows are made in our standard design, or they will be manufactured to meet special conditions. The construction follows, in general, the strictest standard requirements. Great care is taken to secure tight seams and joints to counteract the natural effects of exposure.

Empire Integro Window—Details are the same as described for the standard window, with the addition of special interlocking features which combine to produce all the effect of a weatherstripped window.

Empire Bronze Doors

Bronze doors are now built in a more substantial and more attractive manner by using extruded bronze panel mouldings and edge pieces.

Specifications—Stiles and rails are to be kiln dried white pine, free from loose knots and blue sap. The panels are to be 3-ply laminated wood cores covered with No. 20 gauge bronze, glued on under pressure of 350 lb. per sq. in. Covering of stiles and rails to be No. 18 gauge bronze. Extruded bronze edge pieces ⅛ in. thick to be used around both sides and top and bottom of all doors. Extruded bronze moulding ⅛ in. thick to be used for all panels both solid and glass. Edge pieces and moulding to lap doors on both faces.

All mouldings to be secured with concealed brass screws in all places except the moulding on removable side. ⅛-in. brass plates to be countersunk over all seams and joints on the cores and to be secured by countersunk brass screws. Bronze covering is to be brazed to this plate. The seams between stiles and rails to be invisible.

Empire Copper Doors

It is wise to use an "Empire Copper Kalamein Door" for exterior openings as the chemical composition of copper is such that will enable it to withstand the elements far better than iron or steel.

Empire Metal Covered Smoke Screens

For enclosing stair halls, and corridors, we manufacture in any design to meet any condition.

Empire Metal Covered Elevator Fronts

Kalamein elevator fronts are being used more extensively now than ever before, because the solid core feature makes it practically the only fireproof elevator door which can be operated quietly.

The tinny metallic rattling sound so common in metal sliding doors is absent in kalamein as the wood core acts as a sound deadener.

Empire Architectural Bronze

We manufacture and will erect in any part of the United States, cast and wrought bronze doors, windows, grilles, bank and counter screens, etc. We have specialized in bronze work for years and have many notable installations to which we can refer anyone interested.

FIRECRAFT CORPORATION

TELEPHONES
SEELEY 6490, 10082

Manufacturers of Fireproof Doors

2229-2233 South Ogden Avenue, CHICAGO, ILL.

Products

We manufacture a complete line of FIREPROOF DOORS of every description.

All doors are approved by the National Board of Fire Underwriters' and Factory Mutuals. All doors are labeled by the Underwriters' Laboratories, Inc.

"Firecraft" Type Numbers

Hollow metal doors, Nos. 100 to 199.
Kalamein doors, Nos. 200 to 299.
Steel fire doors, Nos. 300 to 500.
Freight elevator doors, Nos. FB1 to FB50.
Dumbwaiter doors, Nos. FDW1 to FDW10.
Passenger elevator doors, No. PE1 to PE99.
Tin clad doors, Nos. 550 to 599.
Steel plate doors, Nos. 600 to 650.
Storeroom doors, No. 900.

Various Types of "Firecraft" Hollow Metal Doors

Type No. 100, single panel door with "C" finish.

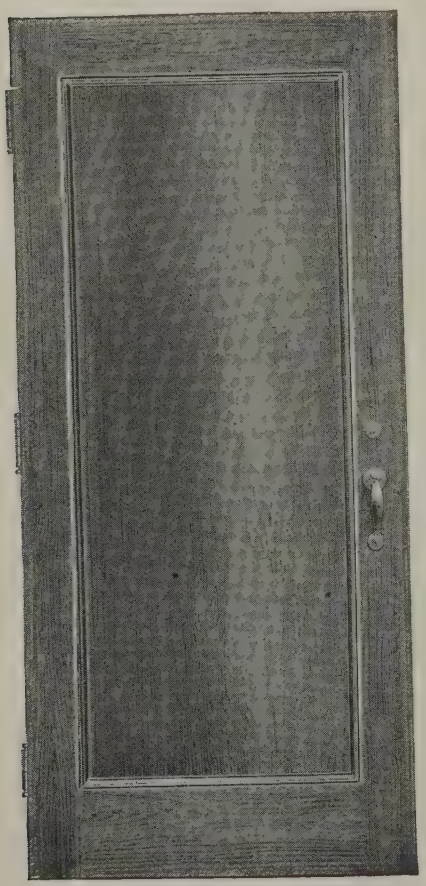
Type No. 195, two raised center octagon panels with corner and side depressed panels. Finish "D" weathered English oak, ornamented with flowers in depressed side panels.

Type No. 136, hollow metal entrance doors to school; has raised panels and recessed mouldings.

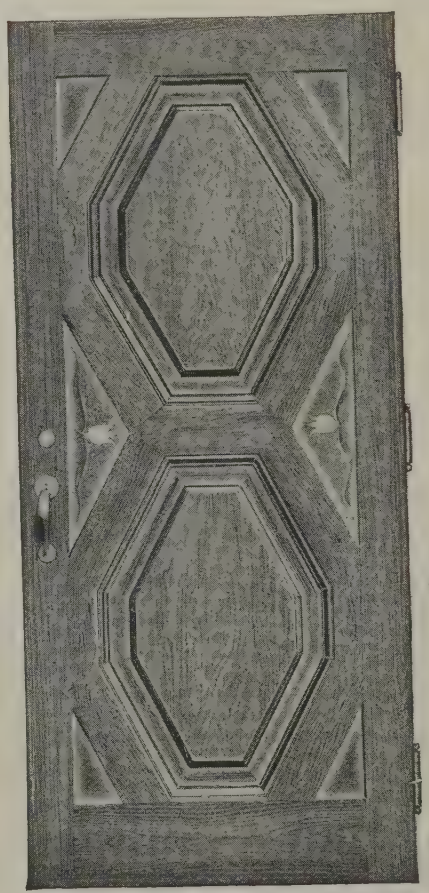
Type No. 110, hollow metal exit door for theatre, having ten panels finished in oak; equipped with panic latch.

We make these doors in all types and designs.

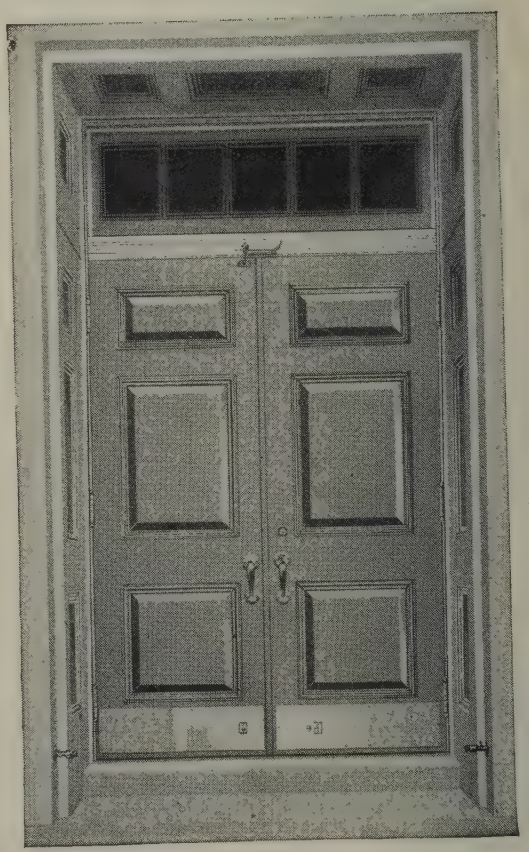
Type No. 110 "Firecraft" Door



Type No. 100 "Firecraft" Door

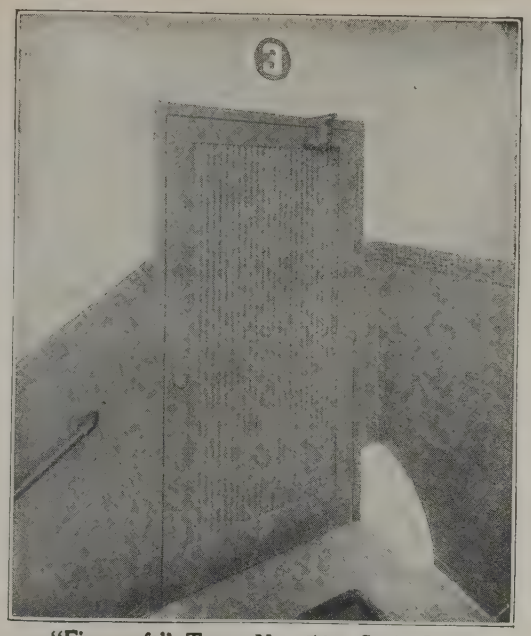


Type No. 195 "Firecraft" Door

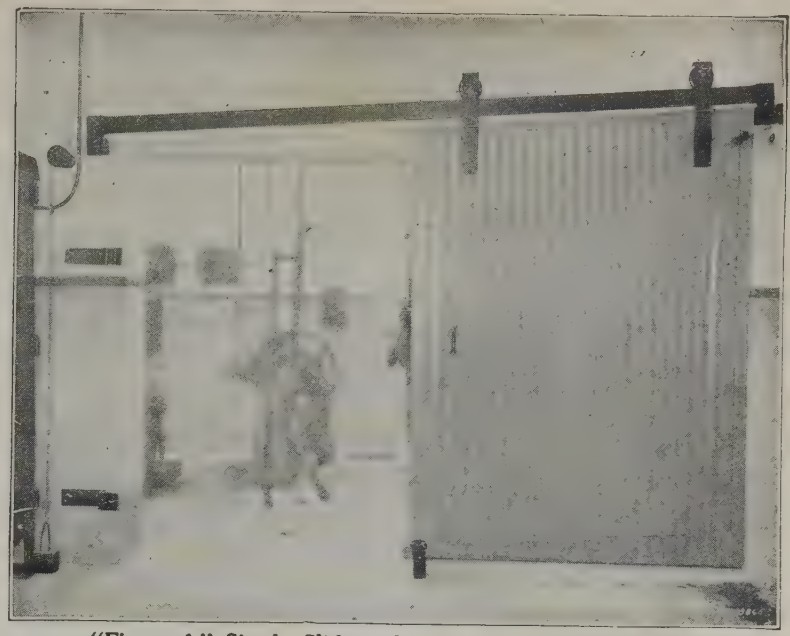


Type No. 136 "Firecraft" Door

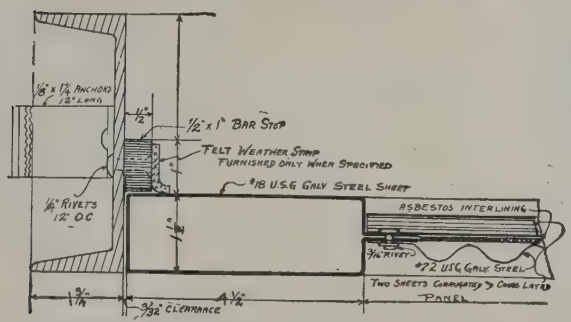
Continued on next page



"Firecraft" Type No. 500 Stair Door
Made of galvanized steel with mortised hardware



"Firecraft" Single Sliding Gravity Type Door No. 400
Overlapping wall 4 in. at sides and top. Automatic hardware



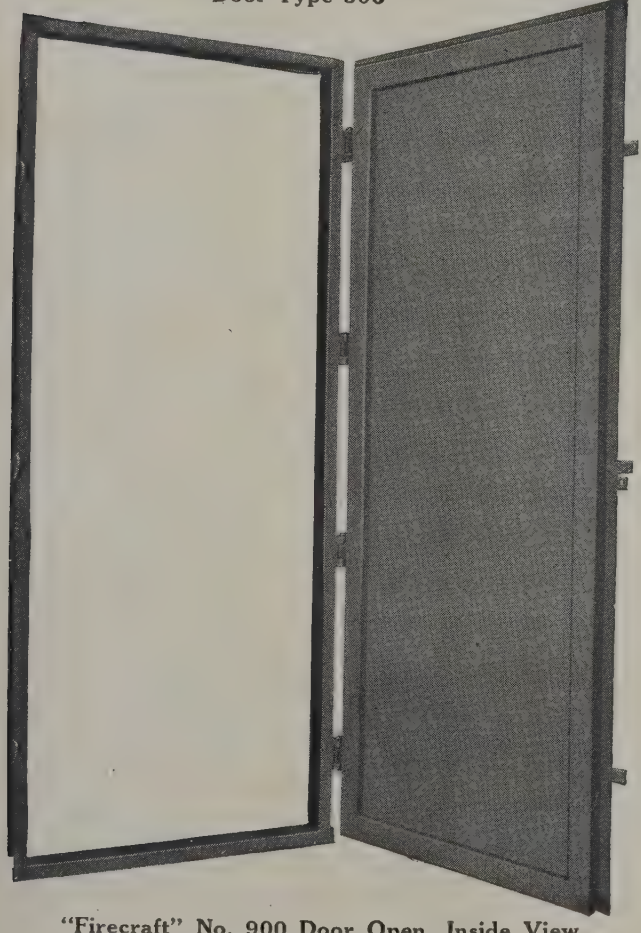
Section Through Door and Jamb, "Firecraft" Door Type 500

"Firecraft" Type Nos. 300 to 500 Doors (Patented)

Construction—Doors are constructed of two layers of cross-layed steel sheets, galvanized and corrugated, interlined with asbestos. The edges are riveted to heavy galvanized steel stiles and rails. Made in all types—swinging, sliding, slide-up and turn-over, etc.

Advantages—"Firecraft" 300 to 500 doors are fireproof, strong, rigid, and comparatively light in weight, and as easily operated as ordinary wood doors.

Not subject to dry rot, as in case of tin clad doors.



"Firecraft" No. 900 Door Open, Inside View
Note clear, smooth, easily cleaned surfaces

"Firecraft" Type No. 900 Doors Underwriters' Labeled

"Firecraft" Type No. 900 doors are designed particularly for storerooms of storage warehouse, but may be used for penthouse and exterior openings. They are a distinct departure from the customary storeroom doors as they are rigid and yet not unwieldy. The outside is ruggedly protected with heavy strap hinges, butts, latches, etc., while the inside surface is clear and easily cleaned with no projecting cross bars to catch dust.

Features—
(1) Rigid construction.
(2) Tight fitting door.
(3) Sanitary construction.
(4) Ruggedly built.
(5) Underwriters' labeled.
(6) Easily cleaned.
(7) Shipped and erected as a unit.
(8) All steel throughout.
(9) Locking device provided.
(10) Material carried in stock for immediate shipment.

"Firecraft" No. 900 Door Closed Outside View
Note strong hinges, etc.

Products

High grade Kalamein (Metal Covered) Woodwork for fireproof and sanitary purposes, including Doors and Trim, Windows, Partitions, etc., in Kalamein, Copper, Bronze and Steel; Fireproof Hollow Metal Windows with Underwriters' label.

Also manufacturers of a general line of Building Sheet Metal Work.

TRADE-MARK

Facilities and Workmanship

Our factory is especially well equipped to produce any design in high grade metal covered woodwork or hollow metal windows, suitable for buildings such as banks, public office and school buildings.

This work can be executed promptly and efficiently.

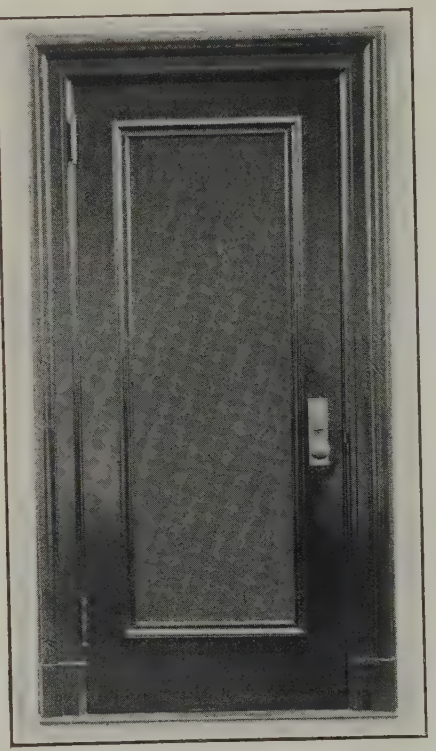
High Grade Metal Covered Entrance Doors

The manufacturing of highest grade metal covered entrance doors is our specialty.

They are made in copper or commercial bronze.

Finish

All bronze and copper work is properly cleaned, oxydized and oiled before it leaves the factory to prevent corrosion.



A Friedrich Metal Covered Door
Hardware applied at factory

Kalamein products are cleaned and painted with one coat of special metal primer.

Metal Covered Mouldings

In order to economize in designing metal covered work, a number of standard stock mouldings for panels, trim, etc., have been shown at the scale of 3 in. to the foot.

By using these mouldings the cost of special dies is saved.

Kalamein Elevator Doors

We make a specialty of metal covered elevator doors in kalamein, copper or bronze.

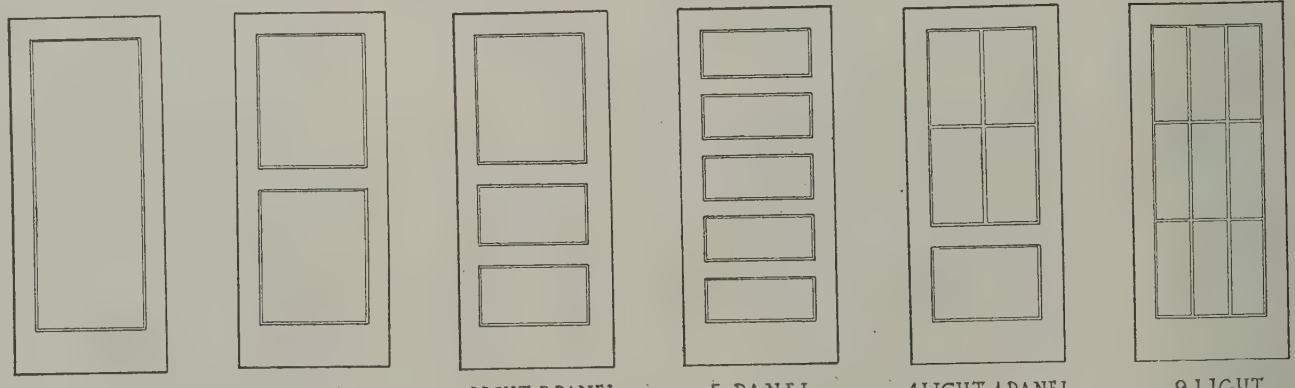
These are furnished in three types: swing, slide, or combination slide and swing, and in any design. Mouldings to be standard to fit our dies.

Doors can be furnished complete with hardware.

Specifications for Kalamein Doors and Smoke Screens

Where indicated on plans, doors, jambs, trim, side lights, transoms, etc., shall be kalamein.

All metal used for covering shall be "Keystone" copper steel. No. 26 gauge to be used for stiles, rails, jambs and panels, and for all sash and trim, and No. 28 for all moulding.



DETAILS SHOWING STOCK KALAMEIN DOOR DESIGNS

Continued on next page

All cores shall be made up from clear kiln dried white pine, free from loose knots, sap and shakes.

All cores shall be milled true to form. All stiles over 6 in. wide shall be built up of small strips glued together. All door stiles and rails shall be mortised, tenoned, and glued together.

All door stiles, sash, jambs, mouldings, muntins and trim shall be drawn through steel dies. All mouldings and edges shall be clean, sharp and true to detail with metal fitting closely to wood cores.

Special care must be used in assembling to avoid bench marks as much as possible.

All joints between metal shall be filled with solder and scraped flush.

After work is assembled all metal surfaces shall be thoroughly cleaned, with oxide of iron, of grease and all foreign substances, and given one coat of special metallic primer sprayed on even and smooth.

Hollow Metal Windows

A complete line of hollow metal windows, underwriters' label, of all types is manufactured by this company.

This includes double hung stationary, pivoted, and combinations of these types.

All windows are made with cutting and forming dies which insure the fitting of every member when assembled and a perfect operating window. Made in standard No. 24 gauge, also Heavy Type No. 20 gauge.

Specifications and details sent on request.

GROSS METAL PRODUCTS COMPANY

Manufacturers of Architectural Hollow Metal Doors, Frames and Trim

2575 Como Avenue
ST. PAUL, MINN.

3325 Como Avenue
MINNEAPOLIS, MINN.

REPRESENTATION IN ALL PRINCIPAL CITIES

Products

GROSS STEEL SLAB DOORS, HOLLOW STEEL and BRONZE DOORS, FRAMES and TRIM, ELEVATOR ENCLOSURES and CABS.

Also special Sash and Frames; Steel Partitions.

Service

Competent engineers at all times are at the disposal of architects and contractors for special information or assistance.

Gross Hollow Metal Doors

The panel doors are built according to the best practice, and quality is at all times the first consideration.

Labels—Underwriters' labels can be furnished when required.

Material—Doors are constructed of No. 1 furniture steel, full pickled, full cold rolled and stretcher leveled.

Frames are constructed of pickled cold rolled steel.

General Description—All doors and frames have gas or electric welded joints, all perfectly ground after welding.

Rails and stiles are constructed of No. 18 gauge steel properly reinforced for hardware, with compressed cork inserted to deaden metallic sound. Panels are two thicknesses of No. 20 gauge steel, with $\frac{5}{16}$-in. asbestos between. Mouldings are of one piece and firmly locked to stiles and rails, or separate mould on each side, no screws being used except for loose glass mould.

Frames are constructed of No. 16 gauge pickled cold rolled steel, true to profile with clean sharp lines; mortised and reinforced for all hardware, then joints properly welded. Six anchors are regularly furnished with each frame without transom, and eight for frame with transom.

Finish—All surfaces of metal are first thoroughly cleaned to be free from all grease and other foreign material, then each coat as applied is baked and sanded. Any finish can be applied whether primed, enameled solid color, or grained to match woodwork adjacent to metal doors or trim.

The personnel of our finishing department is composed of highly skilled metal finishers, and all work is given expert attention.

In asking for quotations, the color and nature of finish should be carefully described.

Installations of Hollow Metal Doors, Frames and Trim

Following is a partial list of installations executed by us:

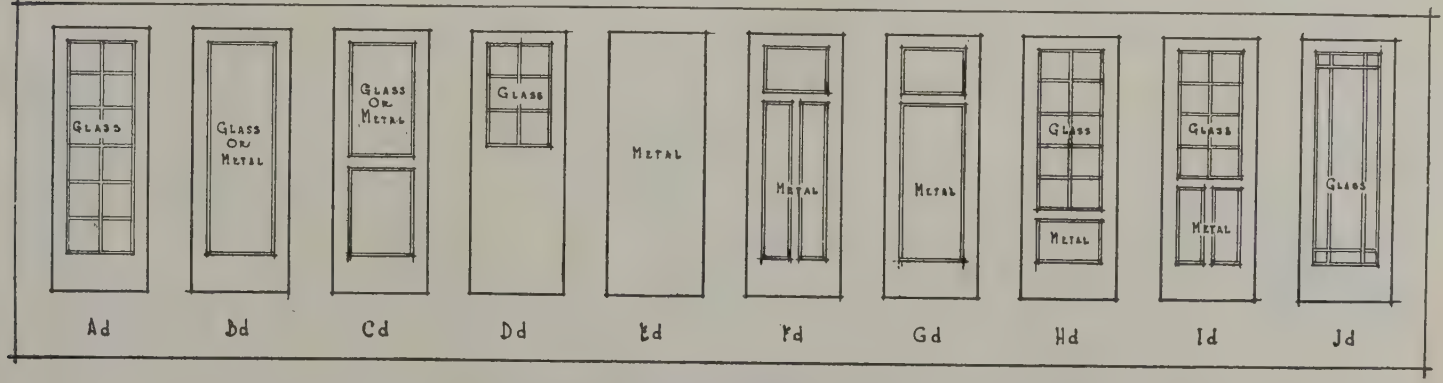
30 W. Washington Street, Chicago, Ill., Schmidt, Garden & Erikson, Architects.

St. Theresa's College, Winona, Minn., 1150 slab doors and frames, C. H. Johnston, Architect.

Mayo Clinic, Rochester, Minn., Ellerbe & Co.

Duquesne Light Company, Pittsburgh, Pa.

Marine Hospital, Cleveland, Ohio.



Various Types of Gross Hollow Metal Doors

Continued on next page

Gross Hollow Metal Slab Doors

Gross Hollow Metal Slab Doors being spot-welded on both sides every 2½ in. both vertically and horizontally, become so rigid that they cannot be twisted or warped by any reasonable pressure.

In making a careful examination of Gross Hollow Metal Slab Doors, architects and engineers are astounded at the complete absence of any metallic ring.

The surface of the door is perfectly flat and smooth and can never become unsightly, as in the case of wood doors, by gradual peeling of veneer; or buckling of steel covering applied on kalamein doors.

They can be finished in either solid color enamels, or beautiful wood grain effects baked on in carefully tempered ovens. Unless otherwise specified, however, all doors leave the factory with a prime coat of paint.

All hardware is fitted to the doors at our factory from templates and, after delivery to the building, are ready for erection as soon as hardware is attached.

A careful survey of erection costs proves that a complete unit of Gross frame and door can be installed at a cost very little above a complete wood unit. When estimating the cost of installation, the fact should not be overlooked that there is no future annoyance caused by swelling or warping, or expense of refitting due to climatic conditions, as is the case with wood doors.

Specifications—

All flush slab doors, where shown on plans or schedule, shall be Gross Hollow Metal Slab Doors constructed with a single No. 20 gauge steel sheet for each side; each side spot-welded to a web-formed reinforcing extending full width and length; approximately 2½ in. on centers. Butts shall be recessed into door and lock properly mortised.

After doors are finished they shall be coated with paint; dipped so that the inside, as well as the outside, is thoroughly coated and left perfectly flat.

Hardware—All doors shall be equipped with the following hardware furnished by the Hollow Metal Door contractor, lock and trim, except knobs, applied at the factory.

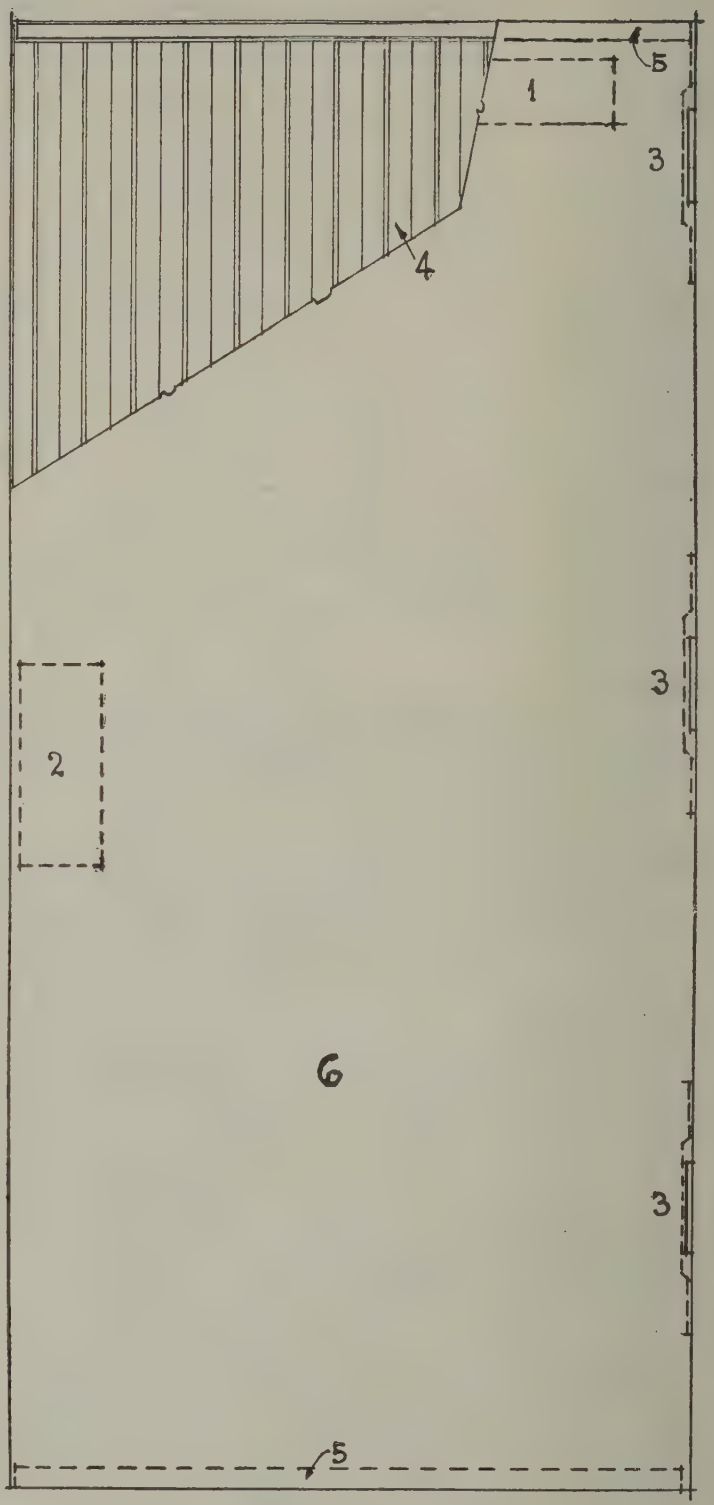
Doors where so scheduled shall be fitted with Yale & Towne cylinder lock No. 77901, knob No. DT35, escutcheon No. DT86. When cylinder knobs are not required use Yale & Towne lock series No. 1500 with knob No. DT35 and escutcheon No. DT86.

Underwriters' Labeled Doors—Where required, our Slab doors can be furnished with Underwriters' labels except for fire walls.

Guarantee

Gross Metal Products are guaranteed to be of the highest quality both in materials and workmanship.

They are absolutely fireproof.



Elevation of Gross Slab Door

(1) Reinforcement for door check, placed in all doors.
(2) Reinforcement for lock and trim. Lock fitted and all holes drilled and tapped for screws by templates.
(3) Reinforcement for hinges or butts. Doors recessed and all screw-holes drilled and tapped by templates to receive butts.
(4) Formed web stiffener full length and width of door. Spot-welded to both cover sheets approximately 2½ in. on centers, vertically and horizontally.
(5) Closing channel ½ in. deep and spot-welded to cover sheets top and bottom of door.
(6) Cover sheets of No. 20 gauge highly finished stock blanked for hardware, and formed to size.

Products

HOLLOW METAL DOORS and TRIM.

ELEVATOR ENCLOSURES.

Also Furniture and Metal Desks.

For Sectional Office Partitions, see pages B2662-2663.

General Description

The stiles and rails are formed from a single sheet of No. 18 gauge steel. All joints and miters are made a continuous weld with acetylene gas process. Panel mouldings electric welded to the stiles and rails, insuring perfect alignment and rigidity. Cork insulation strips are inserted in the stiles and rails to deaden the metallic ring of hollow metal. Panels are insulated with ¼-in. thick asbestos.

Reinforcing plates are placed inside, backing up all hardware. Drilling and tapping for hardware is done at factory. Combination bucks and jambs are made of No. 18, 16, 14 or 12 gauge steel as required. Corners are mitered and gas welded and provided with anchors. Trim is made of No. 18 gauge cold rolled steel. Mitered corners are gas welded. Trim is secured with concealed fasteners or with special oval head screws.

All finished products are thoroughly cleaned, primed and filled, followed by required coats to produce durable finish of color desired. Each coat uniformly applied, baked, and sanded, with final coat rubbed as required.

Products

Doors of Solid Nickel-Silver and Bronze.

For Windows of Solid Nickel-Silver or Bronze, see page A1189.

For Store Front Construction in solid bronze or copper, see pages B2219-2225.

For Shower Bath Doors of solid nickel-silver and bronze, see page C2988.

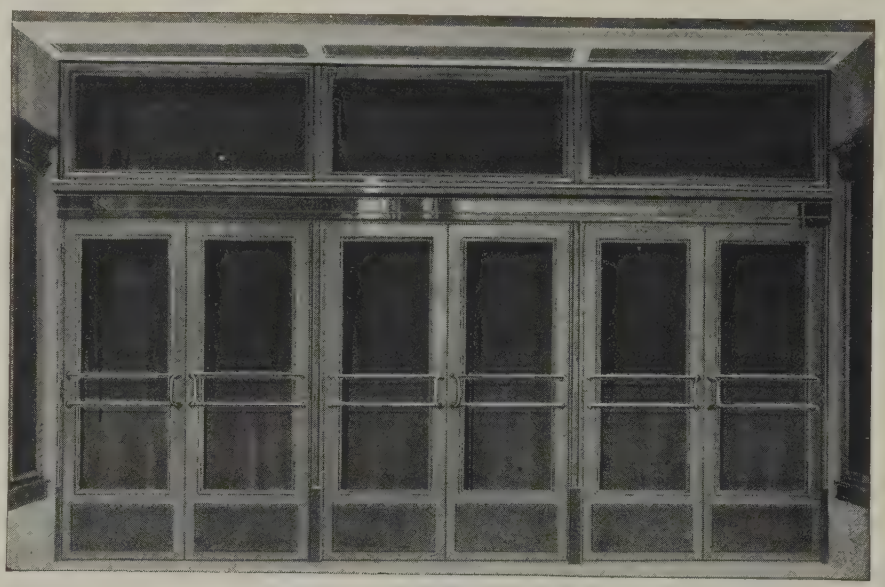
Construction

These doors are characterized by beauty and durability—two very desirable features. The stiles and rails consist of heavy nickel-silver or bronze closed seam tubes strongly welded at all corners.

Two bronze shapes comprise the glazing mouldings, one of which is securely locked to the frame. This arrangement simplifies glazing, and the two metals effect a combination of color that is very agreeable.

Kawneer Doors do not require painting or finishing. They can be made in many combinations and styles. (See illustrations below and elevations on following page.)

All hardware will be applied by Kawneer. Doors will be equipped with thresholds, strongly reinforced with steel, if specially ordered.



Typical Installation of Kawneer Solid Nickel-Silver and Bronze Doors

Special Construction

Kawneer Doors are not carried in stock but are custom made to meet the architect's specifications.

Standwell Metal Covered Doors (Patented)

In the Standwell construction, the metal covering is of Nos. 22 and 24 gauge selected steel, made in tubular form entirely covering the wood cores. The metal is joined together and to the panels by welding, making the basic construction of the door one piece, which insures effective fire retardation.

The joints between stiles and rails are locked by a patented process (section AA below). This method makes the strongest joint possible to produce, also insuring that the metal surfaces of stiles and rails are flush and smooth without the use of a plastic filler. The joints, being filled with solder in the process, are polished over and are practically invisible.

The white pine cores used in the Standwell door serve a double purpose: making an absolute sound deadener (there being no metallic rattle to a Standwell door), also preventing any warping if door is subjected to fire. It also makes the application of hardware a simple matter, as templates are not required in advance as on all-steel doors.

Standwell doors are particularly suited for vertical shaft protection such as stairs and elevators where Underwriters' labels are required.

Doors of types 1, 3 and 4, will be carried in stock for immediate delivery in sizes as shown by schedule.

When ordering by schedule, note that jamb opening size is between jambs and from head jamb to finished floor. Allowance on finished door size is made for joint and for saddle.

Architects can, by using Standwell doors of sizes and designs shown, make a distinct saving for their clients, and owing to the H. F. G. standardized methods of manufacture be assured always of a uniform high quality and quick delivery.

Standard Designs for Standwell Doors

Continued on next page

All-steel Combined Bucks, Jambs and Trim

Bucks of Design 26, 27DT, 27DF, 28 and 29, made from No. 16 gauge steel, are suitable for all interior openings in the best types of buildings. Being of steel they are fireproof, and when used for fireproof openings, in conjunction with Standwell Steel Covered Doors, procure the lowest insurance rate.

They are suitable for non-fireproof openings where wood doors are used, being more economical than wood jambs and trim. The steel buck being erected as a unit, eliminates the extra cost of erecting separate bucks, jamb and trim.

All trim miters are welded, which eliminates the shrinkage and opening of miters found in wood trim.

All trimmed members are formed with sharp, clean corners, that for architectural beauty can not be excelled.

Note: In order to produce the best results in all-steel bucks, architects should specify that when partition blocks are laid, all open spaces between the end and sides of partition blocks and the steel buck should be slushed with mortar. If this is done there will never be any cracking of plaster around the buck.

LYON-CARR FIRE DOOR COMPANY

Manufacturers of Underwriters' Labeled Tin-clad Fire Doors

TELEPHONE
WEST 2703

1737-1743 Walnut Street
CHICAGO, ILL.

Products

LION STANDARD TIN-CLAD FIRE DOORS and SHUTTERS bearing Underwriters' Label.

LION STANDARD FIRE DOOR HARDWARE bearing Underwriters' Label.

Also Lion Kalamein Doors and Frames; Lion Standard Meeker Elevator Doors.

Fire Door Types

Designed to conform to various wall conditions, they are of many kinds—swinging (both single and double), and sliding (either gravity, level, horizontal or vertical). Doors are made both 2-ply and 3-ply.

Standard wood core tin-clad fire door construction is extensively used for the protection of large and small openings in fire walls of either old or new buildings.

Official Approval

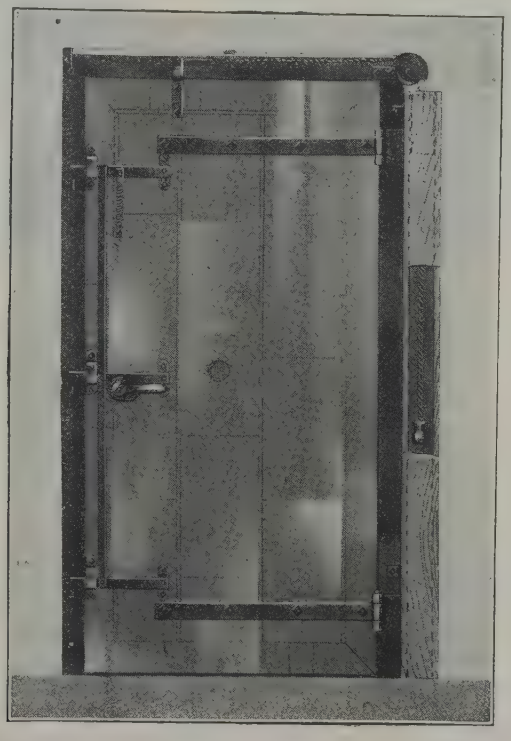
Lion standard tin-clad fire doors and fixtures are approved by the National Board of Fire Underwriters, the New England Mutuals and the Associated Factory Mutuals. The doors are inspected and labeled under the supervision of the Underwriters' Laboratories, Inc., and fully approved by local and state inspection bureaus.

Swinging Fire Doors and Shutters

In design, this type can be either single or double swing and hung either to overlap the wall opening or fit in angle frame.

Complete fire door hardware can be furnished with or without the fusible link automatic closing device.

Window shutters are constructed so as to close flush with the face of wall or overlapping wall 4 in. each side and top.



No. 307. Lion Standard Tin-clad Swing Fire Door

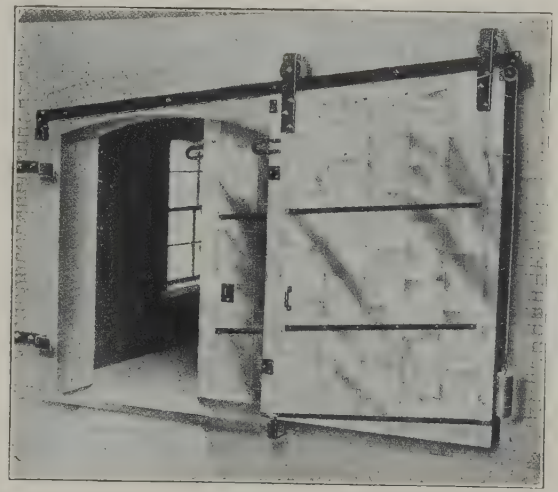
Sliding Fire Doors

Gravity fire doors are particularly adapted to fire wall openings on account of their easy operation. They are hung on inclined tracks which are pitched ¾ in. to the foot. The doors are held open by a counterbalance weight which is released by the melting of the fusible link when exposed to fire or excessive heat. When counterweight is released the door closes rapidly by force of gravity. It slides flush with the wall and does not take up floor space in its operation.

Split-gravity fire doors are designed to meet conditions such as insufficient wall space on either side of opening, and permit doors to slide clear of jamb, or where overhead carrier track passes through opening. Double sets of fire door hardware are required. Doors can be made split-slide for level track as well.

Level sliding fire doors are used where headroom is insufficient to place the track on an incline as required for gravity door. To meet varying conditions of headroom special designs of level track and hangers are provided.

Vertical slide-up fire doors are used where it is impossible to install either horizontal sliding or swinging fire doors. They are counterbalanced so as to balance the weight of the door, and are so arranged that in case of fire the fusible link releasing the weight, allows the door to descend slowly from force of gravity.



No. 301. Lion Standard Tin-clad Gravity Fire Door

Facilities and Workmanship

We make a speciality of fire door work including the manufacture of standard (non-labeled) Meeker freight elevator doors and non-labeled kalamein doors.

Special fire door hardware designed and manufactured to meet unusual conditions.

Lion fire doors and fixtures are built of the best in material and workmanship combining sturdy construction, rugged strength and promise of long service.

They bear the labels of the Underwriters' Laboratories, Inc.

Catalogue

Our latest catalogue contains complete description and illustrations of Lion fire doors and fire door hardware.

Products

Hollow Metal Doors and Trim.
Combination Buck, Jamb and Trim.
Complete Elevator Enclosures.
Drawn Metal Mouldings.

Service

The Lawton-Stephens Co., Inc. cordially invites architects and engineers to use its Sales Department Services. Without obligation of any kind, it will be glad to submit tentative designs and specifications, and co-operate in any way regarding methods of construction or problems where products of this nature are contemplated.

Doors

The Lawton-Stephens Co., Inc., hollow metal doors are made in any variety of styles and sizes as demanded by architects and builders—embracing solid panel, glass panel, raised panel, louver, or flush doors.

Lawton-Stephens hollow metal doors are constructed with care, and represent years of study in this field. They are adapted to meet all conditions where the best and most durable type of fireproof construction is required, such as in hotels, hospitals, apartment houses, office buildings, residences, etc.

Specifications for Standard Hollow Metal Doors—All doors to be of size and design as shown on door schedule and drawings, of Lawton-Stephens Co., Inc. manufacture, or equal, constructed throughout of open hearth, cold rolled, patent leveled, furniture steel. They shall be 1¾ in. thick, 5-in. stiles and rails, except bottom rail which shall be 10 in. in height, and be welded at all points of intersection. Stiles and rails to be of No. 18 gauge steel, with suitable asbestos or cork filler; panels to comprise two sheets of No. 18 gauge steel with suitable asbestos or other filler, or to be a single sheet of No. 12 gauge patent leveled furniture steel, and mouldings to be cold drawn of No. 20 gauge steel. Mouldings to be interlocked with and into these stiles and rails and, where doors are glazed, to be provided with loose steel stops arranged to receive the glass.

Note: If Underwriters' doors are required, they should be so specified—in which event, stiles and rails are lined with asbestos with Z-bar or other suitable spreader.

Special Hospital Type Door Construction

The doors shown were developed specially for use in hospitals where the sanitary feature is of utmost importance.

These doors are semiflush, carrying all of the characteristics and sanitary features of the flush door, eliminating the usual flat, monotonous appearance. This type of door costs very little more than a flush wood door and the finish is a high class baked or grained enamel, the life of which is about 25 years. Statistics show that wood doors must be refinished every three years at a cost of four to six dollars each. The wood doors are also subject to expanding and contracting due to weather conditions which in no way affects a hollow metal door.

Lawton-Stephens Hospital Type Door

Elevator Enclosures

The Lawton-Stephens Co., Inc., is a pioneer in this field of endeavor and has completed extensive installations where the full responsibility for the elevator enclosure has been entrusted to the door manufacturer. The entire opening, including doors, bucks, jamb, sill, glass, glazing and hardware is installed as one contract,

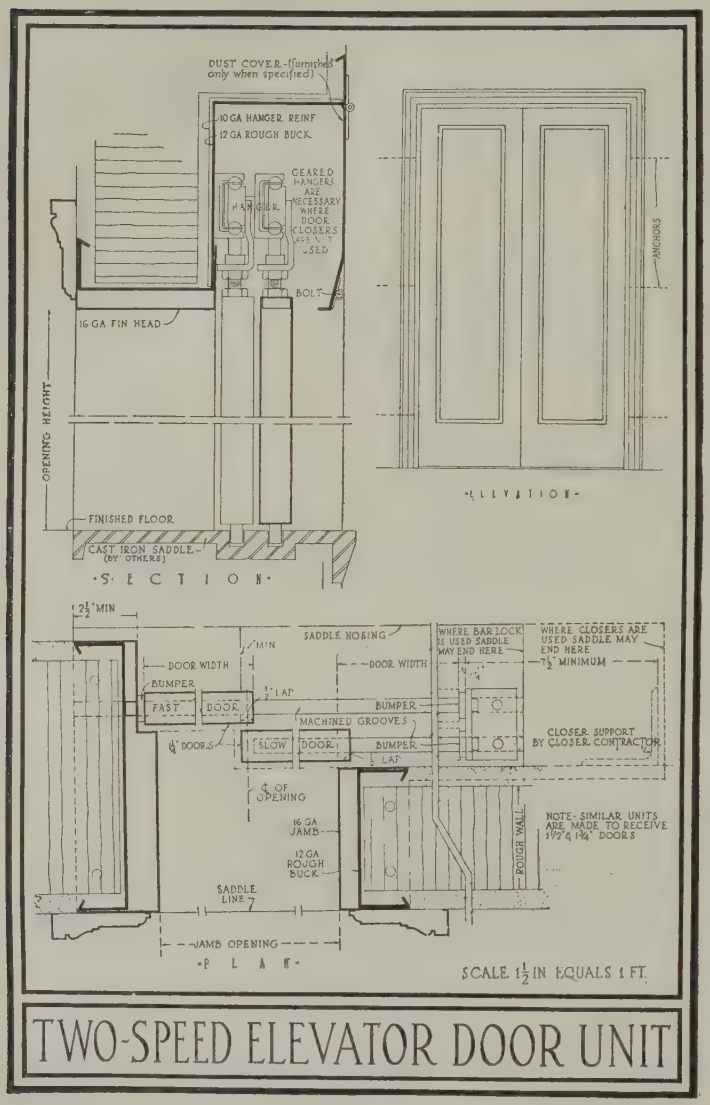
thereby doing away with divided responsibility and faulty operation.

Particular attention has been given to push button installations for apartment houses and this company has developed a special standard installation for this type of enclosure.

Lawton-Stephens Co., Inc., will be pleased to forward to architects and builders complete data, including specification, photographs and sketches, on request.



TWO-SPEED ELEVATOR DOOR UNIT

Jambs

Jambs may be No. 12, 14, or 16 gauge integral combination buck, jamb and trim, or No. 18 gauge cabinet jambs installed with rough steel bucks. With cabinet jamb installation, trim is separate, either clipped on or screwed on, and both jamb and trim can be finished to match the door.

Finish

All surfaces are thoroughly cleaned of all grease and foreign matter before finish is applied. Each coat is then applied and baked.

This Company has an enviable reputation for the quality and durability of its finish and is prepared to furnish a large variety of enamels in plain colors, grained to match wood, or metallic finishes of various shades such as bronze, copper, verde antique or any other finish desired.

Where a prime coat finish is specified, the final coat is applied at the building by the painting contractor.

Mouldings

This Company specializes in drawn metal mouldings, made from either stock dies, or to special detail.

Our service includes a complete machineshop, to make either new dies or to keep old dies in first class condition. A large number of dies are in stock, including such shapes as panel mouldings, trim, automobile mouldings, channels, angles, and special shapes of many kinds. These may be specified in either hot or cold rolled strip steel, galvanized steel, bronze, copper, monel metal or various other metals, as desired.

Other Products

This company manufactures various types of pressed or stamped metal shapes for a large number of different purposes.

THE R. C. MAHON COMPANY

Manufacturers of Kalamein Doors

8650 Mt. Elliott Avenue
DETROIT, MICH.

Product

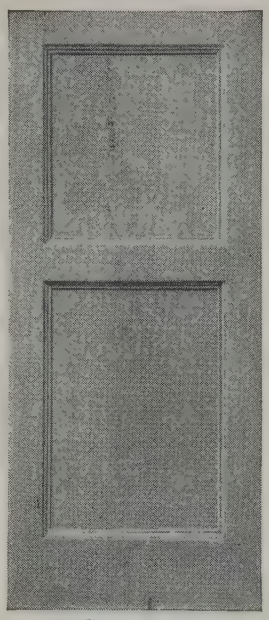
KALAMEIN DOORS.

For Mahon Steel Roof Deck, see pages A201-212; for Mahon Roof Sumps, see page C2789.

Underwriters' Labeled Doors

Mahon Underwriters' Labeled Doors are manufactured from the finest selected kiln-dried white pine, covered with No. 24 gauge sheet steel. All joints are welded, making a sturdy, fire-safe fine appearing door.

Each Mahon Underwriters' Labeled Door must pass the rigid inspection conducted by a representative of the Underwriters' Laboratories, Inc., in addition to the regular shop inspection. This double O. K. insures permanence and absolute fire safety.



Mahon Type 1 Kalamein Door

Standard Fireproof Doors

Mahon Standard Fireproof Doors are of the same general design and high quality as Mahon Underwriters' labeled doors. The standard door is a satisfactory fire door but should not be used where labeled doors are specified.

Standardization of sizes and facilities for quantity production in the Mahon plant make it possible to quote unusually low prices on this type of door.

Service

Mahon designers are available at all times to co-operate on special conditions where standard doors can not be used. They will gladly give the benefit of their specialized experience.

ESTABLISHED 1912 INCORPORATED 1920

THE McCOY BRONZE COMPANY, INC.

Manufacturers of Pyramid Bronze Doors

FACTORY AND GENERAL OFFICES
Forsythe and Holden Streets
DETROIT, MICH.

Products

PYRAMID EXTRUDED BRONZE DOORS.

For Pyramid Extruded Bronze Casements, see page A1255.

Facilities

A complete modern plant manned with experienced and capable workmen.

Service

Estimates will be furnished from architects' plans and specifications. Suggestions and designs or models will be furnished when desired. We solicit your inquiries.

Pyramid Bronze Doors

Suitable for all types of buildings.

The Pyramid Bronze Door is superior in appearance and many times as strong as the ordinary type of bronze door generally built of No. 14 gauge sheet bronze with rivets, screws, or solder to hold members together.

Pyramid Doors have no screws or rivets to loosen up, no welds, brazes nor solder to break. The thickness of material is ⅛ in. which eliminates wavy effects and is heavy enough so that reinforcing is not necessary. Pyramid Doors are made of special extruded bronze members dovetailed and locked together, making a door one hundred per cent more rigid than heretofore obtainable in any other type of construction. Our Pyramid Doors are made in many types and sizes due to this novel construction.

Before placing Pyramid Doors on the market we have carefully tested, and have had many prominent architects and engineers pass upon our construction, and we have yet to find anything but words of praise for Pyramid construction.

Pyramid Bronze Doors through their novel construction may be purchased at a price that will astound the most skeptical buyer.

They are standard in many thicknesses and widths of rail. On the following pages are shown a few of the standard types, made in many sizes.

Pyramid Doors are no heavier than the ordinary type of hollow bronze doors.

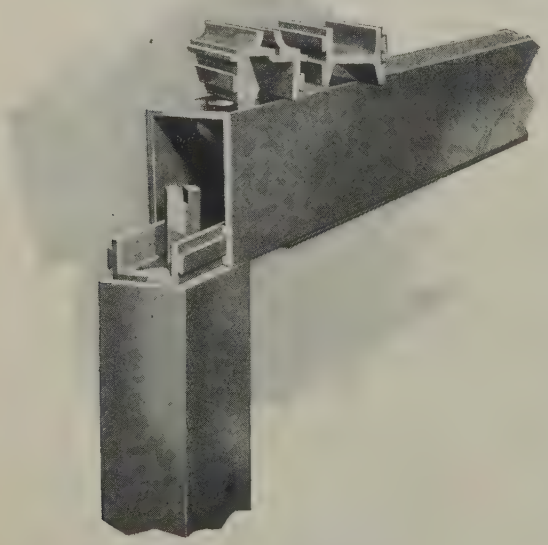
United Artists Theatre Building, Detroit
C. HOWARD CRANE, Architect

Hardware

Our prices include the application of all hardware as selected and furnished by the owner. Our factory is equipped with templates of standardized hardware, which will facilitate delivery and avoid undue delay.

Finish

All work is hand rubbed, removing all scratches and discolor marks. Many beautiful finishes may be obtained on Pyramid Doors.



Section of Construction

Door Bucks

Bucks are made of extruded bronze, structural steel or heavy bent plates and are ordinarily erected before the walls.

Bucks are anchored into the walls with either the legs outstanding or turned into walls.

The frames are securely anchored to these bucks.

Specifications

The door shall be made of extruded metal not less than ⅛ in. thick with dovetailed joints free from all screws, rivets and welds, brazing or solder and held together internally. All edges to be sharp and true to contour, stiles and face of doors to be free from wavy effects. The doors are to be Patented "Pyramid" as manufactured by the McCOY BRONZE CO. of Detroit, Michigan.

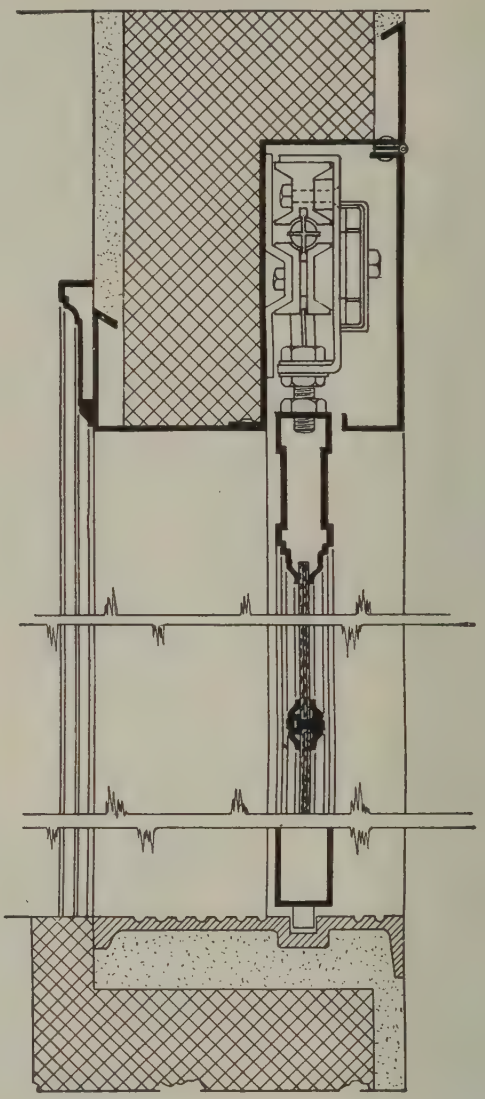
Elevator Opening in the United Artists Theatre Building, Detroit, Mich.
C. Howard Crane, Architect



Many beautiful and pleasing effects may be had by using etched panels as above. Our Pyramid Standard Elevator Doors are so built that the addition of etched or cast panels adds very little to the cost.

Construction—Pyramid Elevator Doors are built of extruded bronze held together with dovetails. They are equipped with continuous removable rubber bumpers.

Cost—Pyramid Elevator Doors, due to their construction are inexpensive, comparing very favorably with the better grade of steel doors.

Prices and literature on request.

OFFICES IN PRINCIPAL CITIES

"ALMETL" TRADE MARK REG. U.S. PAT. OFF.

FIRE DOORS AND SHUTTERS

Products

M & E "ALMETL" Labeled FIRE DOORS and SHUTTERS.

M & E "ALMETL" Unlabeled Doors, for factory and warehouse service.

For "Star" Roof Ventilators, see page A637.

M & E "Almetl" Labeled Fire Doors

Labeled "Almetl" Fire Doors and Shutters for all building openings under jurisdiction and control of insurance interests.

M & E "Almetl" Fire Doors are made in two thicknesses: 2¾ and 1⅞ in. The 2¾-in. door is labeled by Underwriters' Laboratories, Inc. for fire walls (Class A), vertical shafts (Class B), corridor and room partitions (Class C), and exterior openings (Classes D and E) when type and pattern are within the prescribed opening size limits.

The 1⅞-in. door is labeled by Underwriters' Laboratories, Inc. for Class B, C, D, and E situations when type and pattern are within the prescribed opening size limits.

Approvals—Inspected and labeled by the Underwriters' Laboratories, Inc., Chicago, Ill. and Factory Mutual Laboratories, Boston, Mass.; also approved and used by United States Government. Endorsed and recommended by over 250 National, State and Municipal fire and safety control authorities.

Types—Single sliding, pairs sliding, single swinging, pairs swinging, vertical sliding and horizontal lifting.

We also furnish "Almetl" Doors with convex heads, with panels for wire glass, with wicket gates, or recessed for overhead monorail systems.

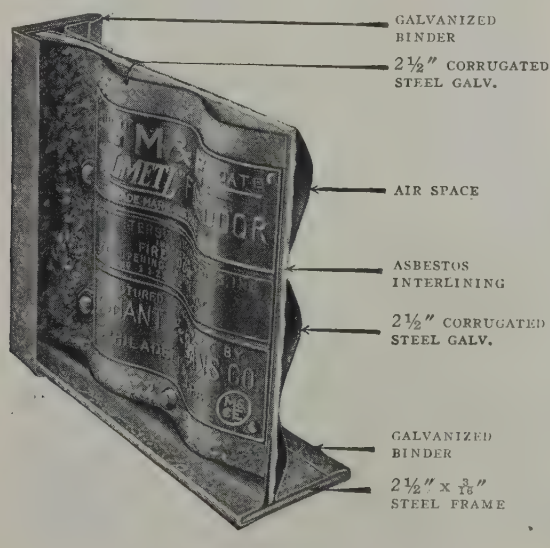
Sliding doors made sectional for assembly at destination when occasion requires; and doors to meet special requirements.

Advantages—Aside from the maximum reduction in insurance rates for installation of M & E "Almetl" Doors, the buyer is assured of 100% value, permanence and service due to the lasting and indestructible materials used in their construction. "Almetl" Doors are all steel and asbestos.

Twenty-year guaranteed—no better value in a "labeled" fire stop obtainable.

They are lighter, and the cost of maintenance is negligible.

Hardware—Fully approved and labeled hardware furnished with detailed erection prints.



Construction of "Almetl" Fire Door
Weight, 4¾ lb. per sq. ft.

Special hardware to meet unusual conditions when required. Lighter unlabeled hardware for unlabeled doors and panels.

Specification for Labeled Fire Doors

Fire doors where indicated on the plans or door schedule throughout the building shall be M & E "Almetl," as manufactured by MERCHANT & EVANS Co. (principal office, 2035 Washington Avenue, Philadelphia, Pa.).

Doors shall be made of two thicknesses of No. 24 gauge—2½-in. corrugated galvanized steel transversely laid, interlined with asbestos roll board in a continuous rigid frame of 2½x3/16-in. bar steel bound in a heavy gauge galvanized steel covering tightly riveted to the frame. Proper provision to be made for expansion and contraction without distortion.

Each door, whether sliding or swinging shall bear the label of the Underwriters' Laboratories, Inc., and also that of the manufacturer.

All hardware and automatic closing devices shall be in strict accordance with requirements of Fire Underwriters having jurisdiction.

M & E "Almetl" Unlabeled Service Doors

Unlabeled "Almetl" Service Doors for all commercial purposes—to enclose openings to street, yard, loading platforms; for sheds, exterior and interior openings of all kinds not subject to insurance control.

These doors are of the same sturdy construction as the labeled product, excepting slight reduction in insulation features.

The special merits and advantages of these doors are light weight, neat appearance, low cost, durability in service. They can be designed for every use and any building mechanic can install them, using standard warehouse door hardware.

Service

We or our 300 responsible and experienced "contracting and erecting licensees" will quote on "Almetl" Doors and Shutters separately, with or without "approved" hardware and installation—for any contract anywhere.

Our centrally located plant is equipped with up-to-date machinery and skilled workmen.

Our sales and engineering department is thoroughly informed and organized to advise on any unusual or complex installation problem.

Single Swinging Door

METAL CLAD DOORS, INC.

685 Concord Avenue, CAMBRIDGE, MASS.

Products

METCLA METAL COVERED DOORS, FRAMES, TRIM, ENTRANCES and WINDOWS; TIN CLAD FIRE DOORS and SHUTTERS.

Kalamein and Tinclad Doors are furnished either with or without Underwriters' label.

Metcla Metal Covered Doors, Frames and Trim

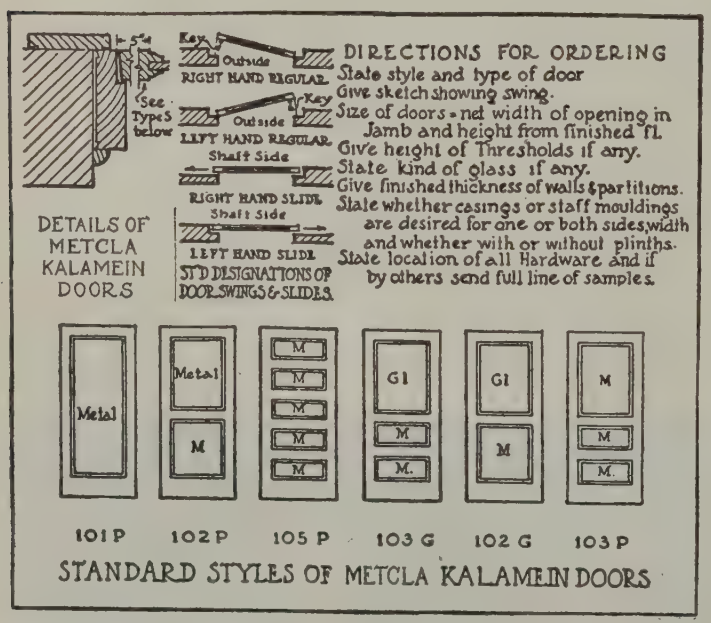
Made by drawing sheet metal through steel dies over a wood core of white pine. This process practically welds the metal covering to its core, eliminates buckles and brings out all moulding members in clear relief.

Made in kalamein iron, galvanized steel, copper or low brass; in sections, tongued, grooved and pinned together, and finished with a priming coat of paint. Glass is not furnished by us.

Standard styles in kalamein iron are illustrated below. Special styles and sizes will be furnished on short notice.

No. 102G
Metcla Metal Covered Door

Metcla metal covered doors, frames and trim are approved by leading architects and engineers, and have been used under the most severe conditions. In specifying Metcla doors, frames and trim the architect is assured of the utmost in quality, workmanship and durability, upheld by continuous service and a high reputation for materials and workmanship.



Metcla Metal Covered Windows

The outstanding qualities of Metcla windows are their simple construction, ease of operation, fire retarding qualities, and the unusually high standard maintained in regard to the materials used in their construction.

They combine safety, economy, durability and weatherproofness.

Made for all classes of buildings in all required types and sizes, either from our own or architects' details and to conform with special requirements.

Furnished glazed or unglazed, with or without hardware, as required.

Metcla Metal Covered Entrances of Copper, Bronze or Kalamein

Metcla entrances are made in accordance with the architect's details to meet every requirement. They are a striking feature of many prominent public and private buildings and have all the advantages and the appearance of cast metal doors, without their extreme weight or cost.

Mill Entrance
Metcla Copper Kalamein

Metcla Kalamein Elevator Fronts

Metcla kalamein elevator fronts are specified for durability, ease of operation and appearance, where sheet steel doors are not desired, or where hollow metal doors would be too expensive.

Tin Clad Doors and Shutters

These are made in any style and size, and are furnished with or without hardware f.o.b. Boston or installed with or without Underwriters' labels.

Tin Clad Underwriters' Labeled Doors.
Metal Covered Smoke Screens.
Elevator Enclosures.

Peerless Metal Covered Doors, Windows, Frames and Trim

Cores—Sound, kiln-dried white pine, free from loose or large knots, dry rot, sap or shakes, machined to proper dimensions.

Metal Covering—Metal is free from all waves, blisters and any imperfections. Metal covering is drawn over wood through steel dies. Edges are sharp and true.

Metal for stiles and rails is No. 26 or 24 gauge long terne or galvanized or No. 24 or 22 gauge furniture steel.

Panels—All panels are 3/8 in. thick of three-ply laminated white pine wood cores with metal glued under pressure on both sides with waterproof glue.

Bronze Covered Doors

We specialize in the manufacture of bronze covered doors used for entrances and lobbies of banks, theaters and commercial buildings. The covering is either No. 18 or 20 gauge bronze. All seams between stiles and rails are of hairline width. Panel and glass mouldings are of extruded bronze.

Copper Covered Doors

The well-known weathering qualities of copper combined with our weatherproof construction of all joints make our copper covered door stand up under the severest climatic conditions.

Underwriters' Labeled Doors

We manufacutre every type of labeled tin clad fire door to meet all conditions imposed by the insurance, building and fire departments. The doors are inspected and labeled under the supervision of the Underwriters' Laboratories, Inc.

Metal Covered Smoke Screens

These smoke screens are made in accordance with architects' details to suit conditions in corridors and stair halls.

Elevator Enclosures

Our elevator enclosures are made for every type of opening in elevator shafts. They are practically noiseless in operation and of solid, long lasting construction.

DRAWN METAL COVERED WOOD DOORS, WINDOWS, ELEVATOR FRONTS, PARTITIONS and TRIM in Steel, Copper and Bronze.

NEW YORK KALAMEIN COMPANY

TRADE-MARK

Sound Construction

In the manufacture of our products we follow old established methods, which have been found through long use to be the most satisfactory. Doors are of mortise and tenon construction. No dowels or corrugated fasteners are used. No parts are covered by hand, the doors are strictly a machine made product.

All parts of doors, windows and trim are separately kalameined before assembly. This not only produces the highest class of work, but places us in a position to render a very wide service to users of all classes of metal covered woodwork.

Specification Data for Standard Metal Covered Doors

Cores, Stiles and Rails—Wood used in cores, stiles and rails is sound, kiln dried white pine, milled solid, and free from large and loose knots and sap.

Covering—All parts are covered with No. 24 gauge furniture steel, No. 24 gauge terne plate or No. 26 gauge galvanized iron by die process before assembly.

If doors are to be covered with copper, 16 oz. is recommended; if bronze is used, 20 gauge is recommended.

Panels—Panels are built up as in veneer process, under pressure of 2 sheets of metal, cemented on to approved board.

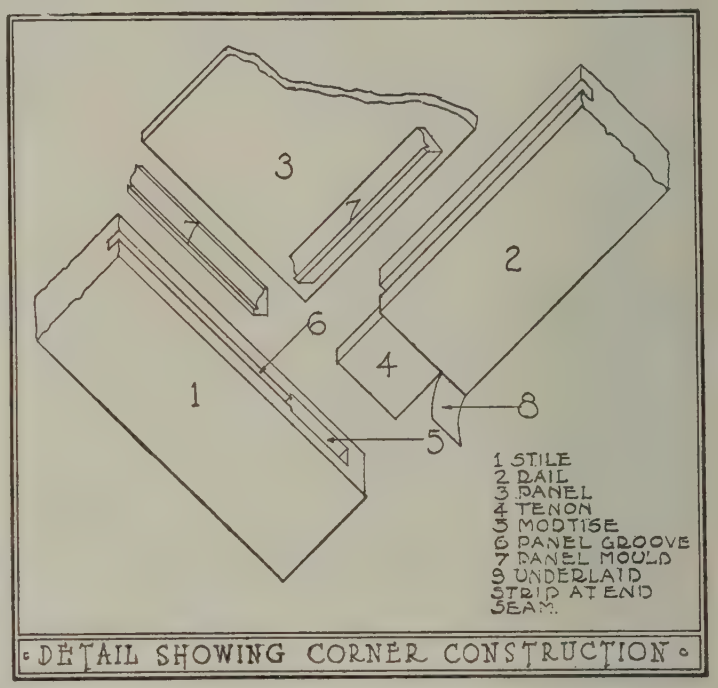
New York Central Building
WARREN & WETMORE, Architects
JAMES STEWART & CO., INC., Contractors
N. Y. Kalamein Doors used throughout

Assembly—Stiles are mortised and rails blind tenoned. Panel is inset into stiles and rails. Surface seams are soldered and scraped smooth. The top and bottom edge seams have underlaid strips of metal making the joints practically waterproof.

Painting—All material is given a priming coat of paint before leaving the factory.

Metal Covered Windows

Metal covered windows of double hung or casement type can be furnished in our own standard designs, or we will build them to specifications. Other types of windows will be manufactured to meet special conditions. All windows are of sturdy construction. Special care is taken to have the joints and seams tight to withstand the action of the weather.



DETAIL SHOWING CORNER CONSTRUCTION

Service

We are prepared to design special metal covered woodwork to fit openings with unusual contours. Upon receipt of drawings or sketches we shall be glad to submit for approval designs for filling any shape or size window opening.

A Pair of Newman Bronze Doors

Construction

All bronze is genuine United States Standard. All ornamental cast work is moulded in the finest of French sand and hand tooled and chased wherever the details require it. All joints are mitered and connections are invisible. The corners of the doors are thoroughly reinforced with cast knees welded together. Types A and B Doors, as shown in details on opposite page, are made of no less than No. 12 Brown & Sharpe gauge, and our Types C and D are made of Extruded Bronze metal of no less than 1/8-in. thickness.

Finish

Finish can be light, medium or dark statuary bronze as selected by the architect. Steel and kalamein doors are finished with either one coat of gray priming or completely finished in baked enamel in any color, either plain or stippled, or in grained wood effects.

Service

Full size details of all work are submitted to the architect for approval and after the drawings are approved, models or photographs of models are submitted to the architect.

Our Engineering Service Department is glad to cooperate and submit designs for any style door desired.

Facilities

The Newman Manufacturing Co., since taking over its new plant, has facilities second to none.

Our Engineering Department is ready to submit any type of design to any architect or contractor requiring special data, stock details, or estimates of cost. They will also furnish special designs to meet any requirements. Our workmen are of the highest type and can materialize a blue print into a beautiful work of art. It is their constant aim to so thoroughly appreciate the spirit of the architect's conception that in carrying out his instructions they will do so sympathetically rather than mechanically. To the skill of the craftsmen we add the greatest care in checking the accuracy of dimensions and a reassuring habit of delivering our work in time.

Our Engineering Service is at your disposal to help in solving any problems involving metal covered materials. Write, telling us about the problem, and we will promptly co-operate with you.

Overly Metal Covered Doors

Overly Metal Covered Doors are manufactured to meet requirements more exacting than the actual conditions usually encountered. Carefully selected materials combined with the skill acquired by long experience produce a finished product that is not only excellent from the standpoint of utility in long service, but also most attractive in appearance.

Overly Metal Covered Doors are furnished with furniture steel, 16 oz. copper or 18 gauge bronze covering, to conform to any detail submitted by the architect.

Labeling Service

The following schedule pertains to Nos. 22 and 24 U. S. Standard gauge furniture steel covering. Also for 16 oz. copper covering.

LABELING SERVICE SCHEDULE

Label applied to doors for	Maximum size, ft.		Asbestos panel thickness, in.	Max. glass area, sq. in.	Door thickness, in.
	Single	Pairs			
Vertical shaft	4x8	8x8	¼	None	1¾
Corridor and partition	4x8	8x8	¼	1296	1¾
Fire escapes	4x8	8x8	¼	720	1¾

Specifications—Overly Metal Covered Doors with Underwriters' Labels

All fireproof doors indicated on drawings shall be Overly Metal Covered Doors, bearing Underwriters' labels, as manufactured by W. F. Overly & Sons, Greensburg, Pa., of dimensions indicated on drawings [listed in schedule herewith] including the following construction features:

Cores—Shall be straight grained white pine, either solid or built up with narrow strips, kiln dried (or stock which after a thirty (30) day air drying period, shall be acceptable to the architect), free from sap, dry rot or large or unsound knots.

Finished Core Sizes—Stiles, top rails and middle rails shall be not less than 5 in. wide; bottom rails shall be 10 in. wide; all core stock shall be 1¾ in. thick.

Panels—Shall be asbestos, ¼ in. in thickness.

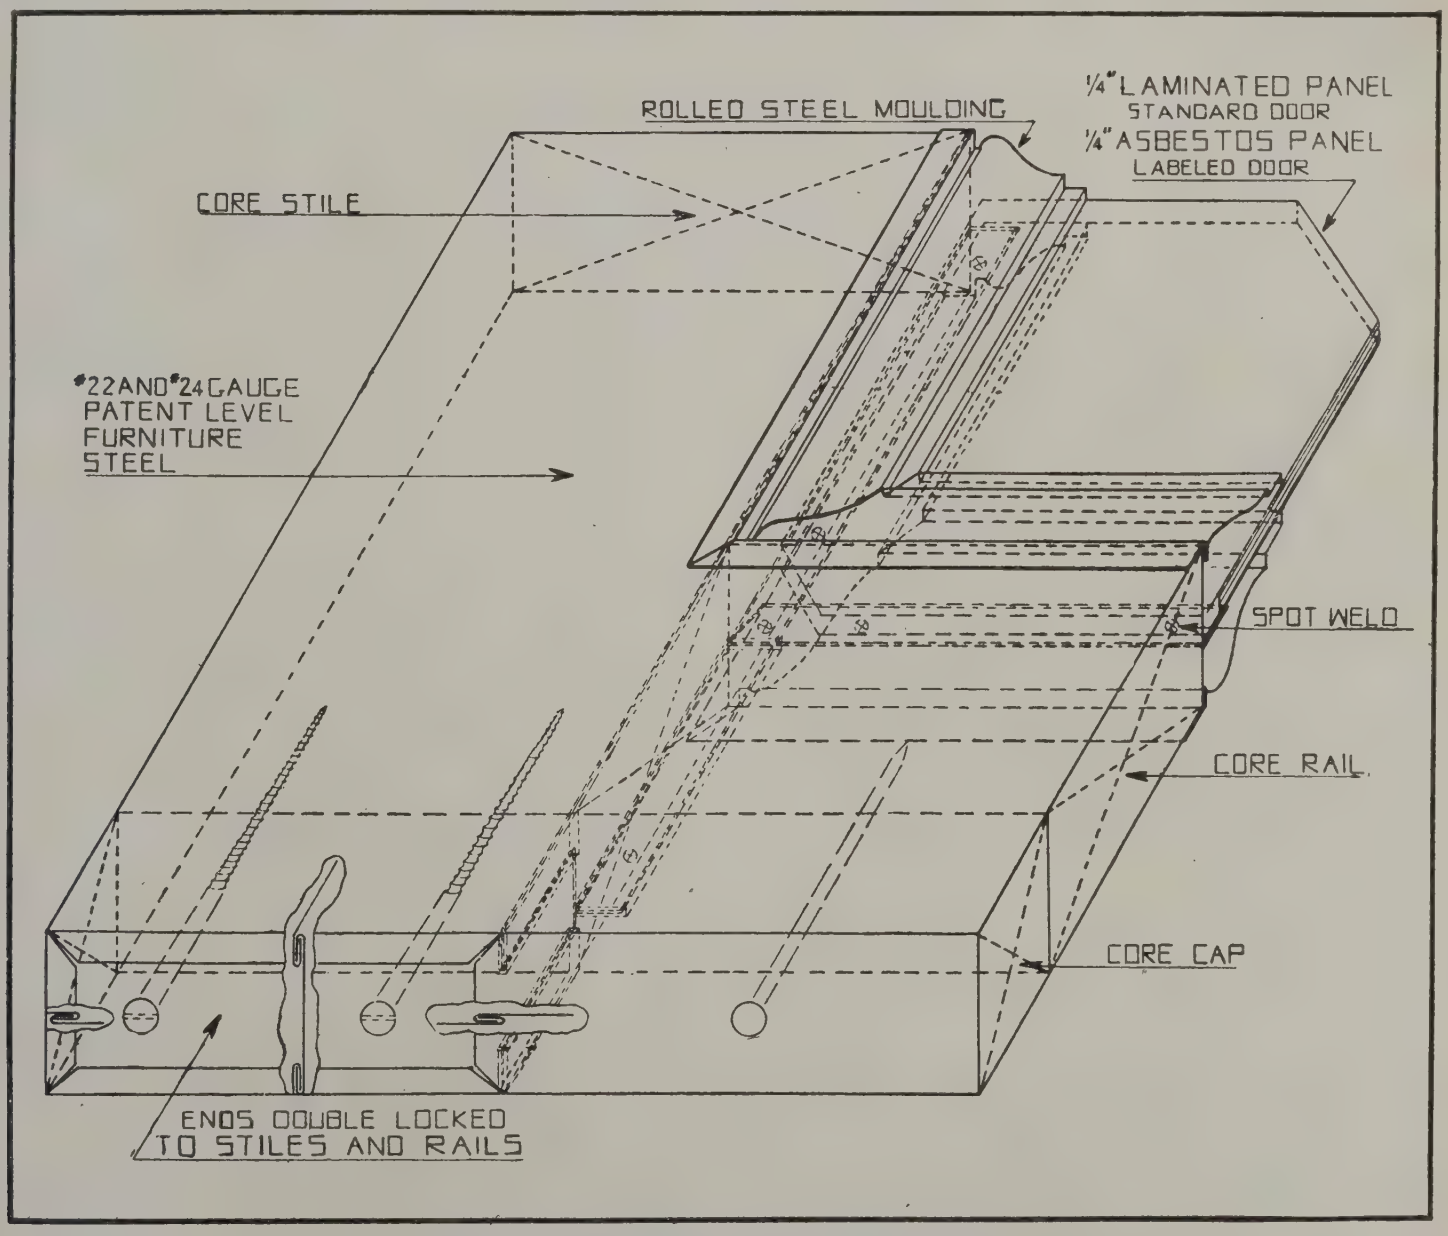
Metal—Shall be 22 [24] U. S. Standard gauge, patent leveled furniture steel [16 oz. copper], free from waves, buckles, mars or other imperfections.

Mouldings and Muntin Bars—Shall be of standard "rolled" steel type. Panel mouldings shall be mitered and acetylene welded and fastened to the stiles and rails by means of No. 6 oval head screws through countersunk holes equally spaced. Muntin bars shall be carefully squared, located and fitted, and thoroughly welded. They shall be prepared to receive glass panels.

Astragals—Doors hung in pairs shall have beveled meeting stiles with a $\frac{3}{16}$x3-in. steel astragal bolted through the meeting stile of one door. Through bolts (¼x2¼ flat head stove bolts) shall be located 2 in. from top and bottom of astragal and at intermediate points spaced not to exceed 12 in. center to center.

Primer—All metal surfaces shall be primed with one shop coat of Berry Bros. special metallic primer or equal, evenly applied, air dried.

Assembly—The metal shall be assembled over stiles and rails, adhering closely to the wood cores. These parts shall be assembled into a unit and squared, welding together both metal coverings on stiles, rails and metal projecting flanges and panels. Seams and double locks shall be made in accordance with the manufacturer's standard detail showing this construction, and shall be soldered and scraped flush to make a perfectly smooth joint.



Typical Overly Metal Covered Door Construction

THE PHILIPP MANUFACTURING COMPANY

Manufacturers of Kalamein Doors, Sliding Door Hardware and Hardware Specialties

EAST HAMPTON, MASS.

Member of the National Fireproof Door Manufacturers' Association

Products

METAL COVERED KALAMEIN DOORS, WINDOWS, DOOR FRAMES, TRIM, UNDERWRITERS' LABELED KALAMEIN DOORS; SMOKE SCREENS; ELEVATOR FRONTS; DUMBWAITER DOORS; BRONZE and COPPER KALAMEIN DOORS.

Metal Covered Doors

Wood cores are made of No. 1 sound, kiln dried white pine, free from loose or large knots, dry rot, sap or shake. Machine sized to accurate dimensions.

Stiles and rails mortised and tenoned, are glued with waterproof glue, doweled and wedged, grooved to receive panels.

Metal covering for stiles, rails and panels is 26 gauge galvanized or kalamein 16 to 32 oz. copper, 20 gauge bronze. Floor mouldings and trim, 26 gauge kalamein, 14 oz. copper or 24 gauge bronze.

Panels are composition board with metal glued to surfaces with waterproof glue, under pressure.

Special care is taken in assembling to avoid bench marks as much as possible.

All joints between metal filled with solder and scraped smooth. All material has shop coat of special metal primer.

Underwriters' Labeled Kalamein Door

Our Underwriters' labeled kalamein doors are built to requirements of National Board of Fire Underwriters and bear their labels. Single doors not to exceed 4x8 ft., pairs not to exceed 8x8 ft. These must be hung in channel, angle or hollow metal frames. We recommend consulting your local requirements to obtain minimum rates on building and contents.

Hardware

We are in position to fit for all mortised hardware on receipt of hardware schedule and samples.

Metal Covered Windows

Double hung or casement type windows are made in our standard design. All metal drawn on core to give neat and serviceable window.

Kalamein Elevator Fronts

Combined slide and swing, two-speed and three-speed, and standard swing elevator doors are serviceable and noiseless and are extensively used.

Kalamein Smoke Screens

We manufacture kalamein covered smoke screens of all types and for all conditions. Note one of our standard construction on next page.

Bronze and Copper Kalamein Doors

We also manufacture a high grade line of bronze and copper kalamein doors, etc., for entrances in banks, theaters, public buildings, etc.

Service

Estimates will be furnished from the architect's plans and specifications. Suggestions and shop drawings will be furnished whenever desired. We solicit your inquiries.

Blue Prints of Mouldings and Casings—We have a series of blue prints of our various stock designs of panel mouldings, stop mouldings, and casings which we will be glad to mail upon request.

Facilities

Our new and modern manufacturing plant, containing 80,000 sq. ft. of working space and 25,000 sq. ft. of storage space, is equipped with the latest and most improved metal and wood working machinery, most of which has been specially designed to meet every requirement of producing only the highest standards of quality in all-metal fireproof products. All orders, large or small, can be promptly executed.

Prices furnished on receipt of schedule covering the following data (unless plans and specifications are furnished to us):

Doors: Size and style of each.

Jambs: Width and thickness required.

Casings: Moulded or flat; state width and whether one or both sides of opening, with or without plinths.

Specifications for Metal Covered Doors, Jambs and Trim

Metal Covering—All wood forming parts of doors, jambs and trim to be covered with metal as follows:

Kalamein Iron Covered—Doors and jambs, Nos. 22 to 26 gauge and trim No. 26 gauge.

Furniture Steel Covered—Doors and jambs, Nos. 20 to 24 gauge and trim No. 26 gauge.

Copper Covered—Doors and jambs, 16 to 32 oz.; mouldings and trim, 14 or 16 oz.

Bronze Covered—Doors and jambs, 14 to 20 gauge; mouldings and trim, No. 23 gauge.

Cores—All wood in doors, jambs and trim shall be clear white pine and shall be thoroughly seasoned, dried and free from shakes, sap, loose or large knots, or any defects impairing strength or durability. Doors to be made, 1⅜, 1¼, 1⅜, 1⅜, 2¼ in., or heavier, if required. If doors are either 1⅜ or 2¼ in. thick, stiles, top and cross rails are to be 5 in. wide and bottom rail is to be 10 in. high.

Jambs to be made 1⅜ or 1¾ in. thick, by width shown on drawings, if rabbeted; or ⅞ or 1⅛ in. with loose stop applied.

Trim moulded or plain as shown.

Finishing—All kalamein or galvanized iron material to receive a priming coat of paint in our shop before delivery.

If finish painting is desired, finish to be solid or grained in colors as selected, in air dried enamel finish.

Bronze and copper work to receive an oxidized finish of color as selected.

Underwriters' Labels—Underwriters' labels can be secured for doors leading to stairways, corridors and partitions, fire escapes and fire tower openings, which, when installed in accordance with the following specifications, will procure minimum insurance rate for building and contents.

Stair and Elevator Doors—Labeled for single doors up to 48 in. wide and in pairs up to 96 in. wide; made with solid panels hung on channel iron or combination steel frames with 5x5-in. full surface butts, mortise cylinder locks with ¾-in. throw bolt; stair doors should be made self-closing either by coil spring or door check.

Fire Escape and Tower Doors—Labeled for the same size openings as stair and elevator doors, and can be constructed to receive wire glass, not exceeding 5 sq. ft.; hung in the same manner as stair doors.

Corridor and Partition Doors—Constructed to receive 8 sq. ft. of wire glass and bearing the Underwriters' label; may be hung to metal covered jambs when stair and elevator doors are labeled.

Specifications for Plate Warehouse Doors

The contractor shall provide and install, where shown on the drawings, non-automatic swing type steel Underwriters' Labeled doors to all storerooms, similar to those manufactured by the Reliance Fireproof Door Co., Brooklyn, N. Y.

General—The doors shall be non-automatic swing type, equipped with triple latch, all mounted and attached to No. 12 US Standard gauge steel frame.

Frame—Shall be made of No. 12 US Standard gauge furniture steel, free from scale and formed with a 2-in. flange or trim on room side and 3-in. on corridor side, with edges of trim returned to receive finished plaster walls. All miters shall be welded by the oxy-acetylene process. Frames shall extend 2 in. below finished floor [frames shall set on finished floor].

Mullions—Provide 6-in. mullions between doors to receive dividing partition. These shall be constructed as indicated by the detailed drawing.

Anchors—Strap iron anchors shall be attached to the jambs of each frame placed 12 in. above floor and below head and 24 in. apart. Frame shall be slotted to permit adjustment of anchors.

Note: Where frames extend 2 in. below finished floor the following clause should be included in specification.

Sills—Provide channel shaped sills properly welded to frames.

Doors—Shall be made of No. 14 US Standard gauge steel. The elges shall be folded over 1½ in., enveloping one leg of a Z-shaped reinforcing frame in the fold, with miters welded. The Z-shaped frame and horizontal stiffening members shall be made of No. 12 US Standard gauge steel welded at all joints, with an additional reinforcement of No. 12 US Standard gauge steel knee angles 1½x1½ in. welded to both members. Horizontal members shall be spaced not to exceed 2½ ft. apart.

The finished size of doors shall be 3 ft. 7 in. x 8 ft. 6 in.

Hardware—Hinges shall be strap type with pintles attached to frame. Latches shall be 3-point type made of bar stock with coil spring with handle control both sides of door. Catches for triple latches shall be applied to frame.

Assembly and Installation—Each door and frame shall be shipped separately, all equipped with hardware. Each frame shall be installed as a unit, and door hung to frame.

Painting—The frame and door shall receive a thorough coat of special black fire resisting paint applied at the factory.

Underwriters' Label and Trade-mark—All doors shall bear Underwriters' Laboratories Inc. Label, also the manufacturer's trade-mark or name.

Continued on next page

Specifications for Furniture Steel Door Frames

Frames to be made of furniture steel of not lighter than No. 16 gauge US Standard with all miters and joints to be welded and made smooth. Reinforcement for application of necessary hardware to be electrically welded and of proper size to insure rigid construction. Wire wall anchors to be provided which are installed by mason at intervals to insure rigidity. Each frame to be provided with spreaders for parallel alignment. Templates for all hardware to be furnished in reasonable time prior to the manufacture of these frames.

All frames to receive one shop-coat of the best metallic primer and applied in a first-class workmanlike manner to ensure a complete covering on all surfaces, inside and outside.

Note: If required, Underwriters' labels can be secured for openings in vertical shafts, exterior walls, and for openings in corridor and room partitions.

Elevator Fronts, Hollow Metal

Frames—No. 12, 14 or 16 gauge steel combination buck and jamb trim, either pressed or rolled and applied by means of spot-welding. Dust covers and struts to ceiling where so specified.

Saddles—Cast iron or bronze provided with cast stiffener ribs, grooves, milled so as to provide perfect, noiseless operating of doors.

Doors—Furniture steel of No. 18 gauge for stiles and rails. The stiles on front and back are reinforced with No. 16 gauge bumper channels full height of door.

Mouldings No. 20 gauge cold rolled strip steel formed so as to interlock with stile. Intersections of stiles and rails are welded.

Panels of No. 12 gauge furniture steel are inserted in groove of moulding.

Reinforcements are provided for door closer and hangers.

Painting—All work is finished in our standard primer, or baked enamel as selected.

Erection—We have a staff of competent men engaged in erection of elevator fronts.

Special Service Department—We are prepared to furnish and design elevator fronts in all metals and finishes.

Hollow Metal Doors and Trim

1514-1526 West 25th Street

CLEVELAND, OHIO

Products

Hollow Metal Doors, Partitions, Elevator Fronts, Combination Bucks and Jambs, Metal Base and Picture Mould.

For Steel Stairs, see page A744.

Construction

The R & T hollow metal door with its interlocking joint construction has been developed through nearly twenty years in the door business. Doors are constructed of first grade No. 18 gauge furniture steel, full pickled, full cold rolled, re-annealed, patent leveled, re-squared and oiled. Jambs and casings are of same gauge material. Bucks or frames are fabricated from No. 10 to 14 gauge material in accordance with size of opening and service required. All joints in construction are electric process welded, practically making the door one continuous piece of metal. Proper reinforcements are welded within the door to take care of all hardware requirements and the entire design makes for rigidity, stability, fire protection and neat appearance. These doors can be fitted to either the cabinet jamb design or combination buck and jamb. R & T hollow metal doors, having no combustible material within the door, are fire retarding and fully meet the requirements of the National Board of Fire Underwriters and bear their label, when specified.

Finish

Before assembly, all parts are paint dipped in order to protect the interior of the door. Before final finish, all surfaces are thoroughly cleaned to remove grease or oil.

Each coat of paint or enamel is carefully baked and properly treated to secure the highest possible finish. Doors are finished in prime coat, plain color enamels, stipples and wood graining reproductions.

Hardware

Hardware, as selected and furnished by the owner, is applied at the factory, and we have a good selection of templates of standardized hardware which facilitates delivery and avoids undue delay.

Upon request we are glad to furnish typical details and stock mouldings in order to assist in designing metal trim.

SAINO METAL FIRE DOORS
DEPENDABLE - PERMANENT PROTECTION
TRADE-MARK

Exclusive Manufacturers of Metal Doors for 25 Years

F. L. Saino, president and founder of this company originated the Saino Type metal fire door. For over 25 years our energies have been concentrated on the manufacture of metal doors, exclusively. This specialization has put our organization in a unique position for advising architects and owners soundly on any fire door problem.

Saino Metal Fire Doors

Saino Metal Fire Doors are constructed of two thicknesses of No. 22 gauge 2½-in. corrugated galvanized steel with sheet asbestos lining. As shown below, vertical corrugation is on the exposed side and horizontal corrugation on the wall side. Have a substantial steel frame which together with the Saino exclusive reinforcing bars assures utmost rigidity. Patented features provide for proper expansion and contraction along straight lines—an essential quality to efficiently resist and effectually stop the progress of fire.

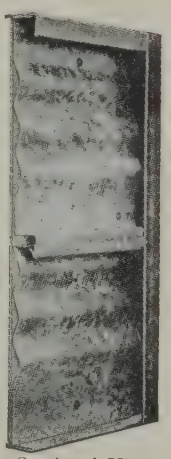
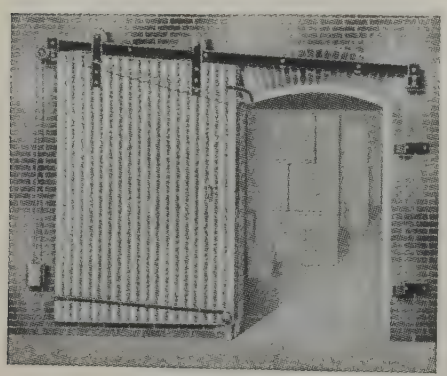
Exposed Side

Standard Saino Metal Fire Door



Sectional View



Type No. 100. Saino Standard Single Sliding Metal Fire Door
Inclined top, 1 link with flat track hardware. Automatic

Types and Limitations of Saino Underwriters' Labeled Fire Doors

Single sliding doors—(incline top, level top and vertical sliding) for openings not exceeding 120 sq. ft. with neither width nor height exceeding 12 ft.

Single swinging doors—for openings not more than 6 ft. wide nor 12 ft. high.

Swinging doors in pairs—for openings not more than 10 ft. wide nor 12 ft. high.

Note: "Saino" Metal Fire Doors too large to ship at regular freight rates can be made in sections and with Underwriters' label for openings not exceeding the above size limitations for single sliding doors.

Also "Saino" Metal Fire Doors for openings exceeding the underwriters' limitations can be furnished with Certificate of Inspection which certifies that doors were built according to specifications for a labeled door. This certificate cannot be furnished except when requested at time order is placed.

Saino, Jr. Metal Doors (Unlabeled)

For use where approved and labeled doors are not required. Of substantially the same construction as the fire door, as shown opposite, except for certain extra fire resisting features. Especially designed for cotton mills, industrial plants, warehouses, loading platforms, etc. Exceptionally rigid, durable and economical, affording quite a saving in maintenance cost over the heavy wood doors, which they are designed to replace. Minimum weight; easily and ecoonmically erected by any good building mechanic.

SYRACUSE FIRE DOOR CORPORATION

INC.

Manufacturers of Metal Covered Doors and Trim and Tin Clad Fire Doors

900 Canal Street

SYRACUSE, N. Y.

Products

UNDERWRITERS' LABELED and NON-LABELED KALAMEIN DOORS, covered with copper, bronze, or kalamein steel, long terne or galvanized; UNDERWRITERS' LABELED TIN CLAD FIRE DOORS and FIRE DOOR HARDWARE.

Also manufacturers of Metal Covered Frames, Trim, Mouldings, etc.; Metal Covered Window Units, Dumbwaiter Units, Elevator Fronts, Smoke Screens, Partitions, Channel and Angle Iron Frames; Hollow Metal Jambs, Bucks, etc.

Syracuse Kalamein Doors

These doors are made in a variety of standard designs for use in office buildings, public buildings, schools, theaters, stores, hospitals, etc.

The wood used in the cores is thoroughly seasoned and air dried before going through the factory. Panels are carefully built up and covered with metal, both sides glued, and placed under heavy pressure to insure good contact and eliminate any buckling. Mouldings are drawn true and accurately mitered. All joints are welded and scraped to smooth surface.

Standard thicknesses for metal covered doors are either 1¾ or 2¼ in.

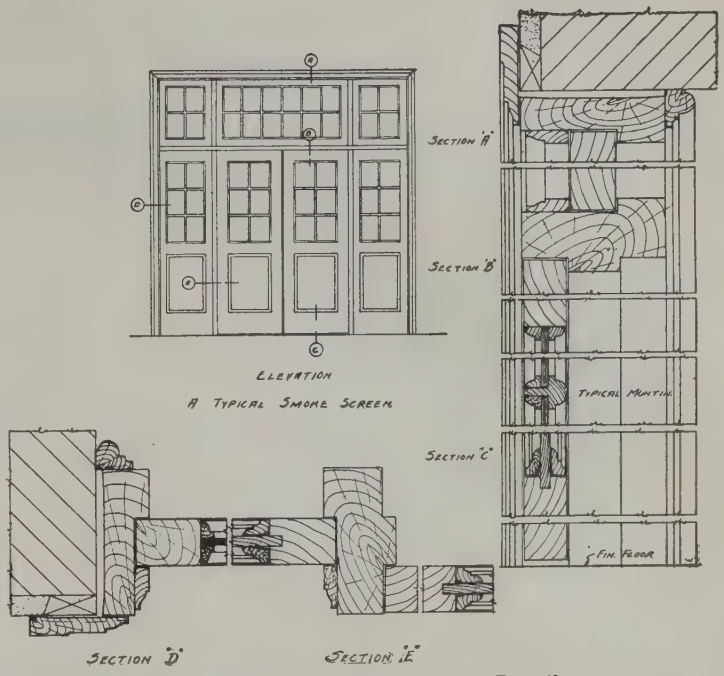
Unless otherwise advised, our doors, etc., are given one shop coat of special metallic primer.

Whenever practical, the metal covering on our kalamein jambs, casings, mouldings, etc., is carefully drawn on the wood cores through steel dies.

Labeled Kalamein Doors

We specialize in labeled kalamein doors.

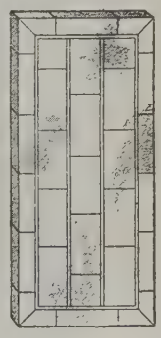
All doors shown below can be labeled excepting doors marked "B," "W" and "X."



A Typical Smoke Screen Detail

Tin Clad Fire Doors and Shutters

All types of labeled and unlabeled, two-ply and three-ply tin clad fire doors and shutters to fill conditions imposed by insurance and building requirements. First class materials, careful workmanship developed by many years of experience and the most modern and efficient machinery serve to make these fireproof units of most approved design.



Doors and hardware bearing the label of the National Board of Fire Underwriters' are inspected by their representative at our shop. This is an additional warranty of their worth as fire retardants.

TRUSCON STEEL DOORS

Engineering Service

Suggestions on doors to meet any conditions will be furnished without any obligation whatever by Truscon Engineers.

Truscon's experience and equipment fit it for unexcelled service both in design and manufacture.

Truscon doors of individual design have been furnished for many specialized requirements.

TRUSCON STOCK TYPE DOORS AND FRAMES

Most practical in design and of highest quality material and workmanship, Truscon Stock Type Doors and Frames are moderately priced because of their efficient manufacture in large quantities. Stock doors are especially adapted for use in basements, rear entrances, boiler rooms, fire exits, elevators and similar places in residences, hotels, apartments, schools, churches, institutions, shops, warehouses, filling stations, stores and any other buildings requiring doors not larger than 10x10 ft.

Swing Doors, Stock Types

By fitting stock type door leaves with the proper hardware, furnished by Truscon, they may be used in any openings requiring single swing doors not larger than 5x10 ft. or double swing doors not larger than 10x10 ft.

Door Frames—For stock type swing doors frames are of heavy pressed steel construction with door stop pressed into the frame. They are heavily reinforced at the corners and at the hinges and are easily assembled and erected on the job.

Slide Doors, Stock Types

By fitting stock type door leaves with the proper hardware furnished by Truscon, they may be used in any openings requiring single slide doors or double slide doors not more than 10 ft. high. While the maximum standard width for stock type double slide doors is 10 ft., two or more leaves may be united into single leaves for use in wider openings. These doors are hung with four-wheel type, extra heavy duty, roller bearing hangers and operate over channel tracks.

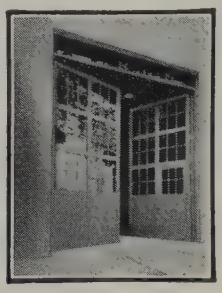
TRUSCON STEEL DOORS FOR LARGE OPENINGS

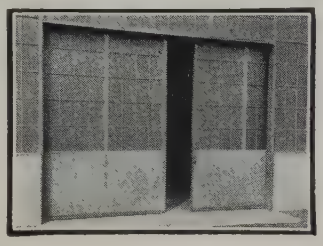
Designed to meet the unusual in door requirements, Truscon Steel Doors for large openings are not limited either as to size or method of operation. They can be furnished in types that swing, slide, fold, roll or operate by a combination of these methods in either vertical or horizontal planes.

All doors coming under this classification are designed by Truscon Engineers to meet the specialized requirements of such buildings as airplane hangars, piers, warehouses, factories, fire stations, garages, roundhouses and similar structures. Truscon's years of experience in designing and manufacturing doors for every conceivable use is available without obligation.

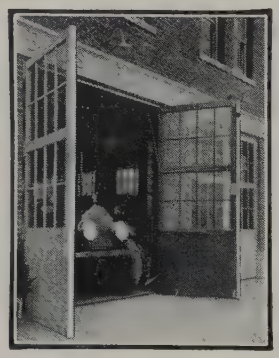
Industrial Type Doors

These doors are intended to supplement the stock type doors in factory, commercial and warehouse buildings requiring doors larger than 10x10 ft., where operating space is not subject to limitations. Made in either the swing or slide type, in practically any size and arrangement, depending upon what is most practical for the building in which they are used.





Fire Department Doors

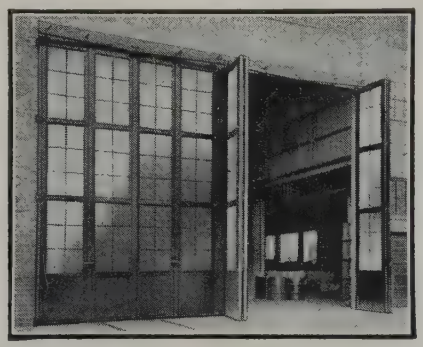


Designed especially to meet the unique requirements of fire and police stations for quick acting sturdy doors that can be relied upon to function perfectly at all times.

Furnished either in the double swing type as illustrated or in the vertical folding type, with or without automatic operating device.

Vertical Folding Doors

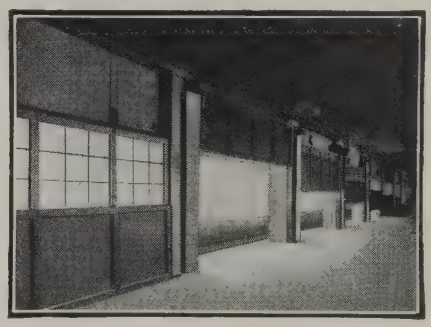
Designed to meet such conditions as are presented by railroad shops, roundhouses, public garages and other buildings where door clearances are limited and maximum unobstructed openings are desired. In



operation the leaves fold like a jack-knife and lie flat against the jamb when fully open. They operate by means of roller-bearing trolleys running on heavy channel tracks.

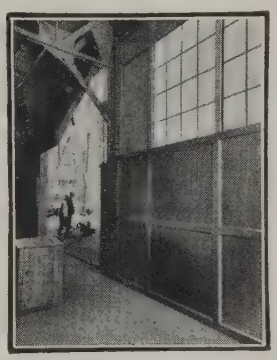
Vertical Lift Doors

Recommended for use in warehouses, freight houses, garages and factories where maximum clearance at the jambs is desired and in which headroom equivalent to half the over-all height of the door opening is available. This door consists of two leaves, hung one above the other. In operation, the lower leaf slides up behind the top leaf and both slide up toward the ceiling, coming to rest above top of door opening. The raising is accomplished by means of hand or power controlled operators.



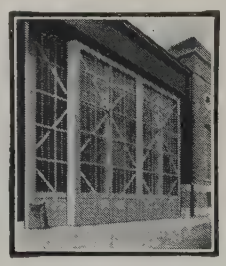
Vertical Lift-Swing Doors

Especially suitable for piers, large warehouses, freight houses and other buildings requiring large doors which must operate easily and swing overhead, out of the way, when opened. This door is divided horizontally into two equal sections. The lower section slides vertically in guides on the jambs into guides on the upper section, nesting snugly behind the upper section. The nested sections can then be swung inward and upward to any angle up to a horizontal position. The raising and swinging is accomplished by operators with either hand or power control.



Airplane Hangar Doors

Truscon Hangar Doors have been perfected to meet aeronautical requirements of any nature and are made in sizes to fit individual installations. They are as light in weight as consistent with proper strength and durability. These doors are usually made of units which run on tracks embedded in the floor, relieving the overhead construction from supporting their weight and effecting important savings in the roof structure. The illustrations show sections of a straight slide and a curved track type.



THORP FIRE PROOF DOOR CO.

1600-1610 Central Avenue
MINNEAPOLIS, MINN.

Products

THORP METAL COVERED DOORS, FRAMES and TRIM.
THORP SMOKE SCREENS.
THORP No. 14 GAUGE TUBULAR ELEVATOR DOORS.
THORP BRONZE and COPPER COVERED ENTRANCES.
THORP HOLLOW METAL FRAMES.

Facilities

All products are made in our new plant which is equipped with the most modern machinery made to suit our individual requirements and fully capable of handling any size order.

Details

Full size and scale details are submitted by our Drafting Department for architects' checking and approval. The requisite number of copies is furnished the general contractor.

Construction and Materials

Thorp Kalamein Doors are made on the basis of the Underwriters' requirements of 3-ply built-up pine core, heavily lined with asbestos and thoroughly nailed with cement-coated nails. All mortises in the core are made and reinforced for hardware at this point.

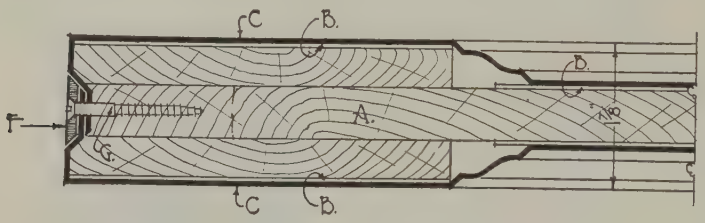


Fig. 1. Section Through Door
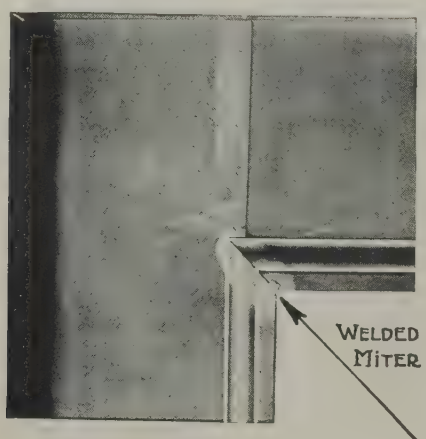
A—Wood core. B—Asbestos paper lining. C—Steel sheet. F—Beveled edge band. G—2-in. wood screw

Metal—The steel covering used is No. 1 furniture steel with 24 gauge for stile and rails, and 20 gauge for panels. If desired, 20 gauge may be specified for stiles and rails as well. The panel mouldings are an integral part of the stiles and rails and formed with them, and are not a separate nailed-in mould.



Back of sheet showing the reinforcement at the butt joint of the stiles and rail, and the welded miter joint of the moulding.

Fig. 2. This System of Welding Avoids All Possibility of Breakage and Looseness

Face of the sheet ready for the polishing.

Welding—All stiles, rails, panels, and panel moulds are electrically welded into one sheet. The two sheets thus formed are lapped on all four edges, formed into a groove and held in place by a steel band. No dependence is placed on mortise and tenon joints or (lag) screws to hold the doors together. No solder is used at all, since the door is welded throughout.

Mouldings—We have a large number of dies for both solid panel and glass panel moulding. Since it is more economical to use standard dies, we make our quotations on this basis unless specifically stated otherwise.

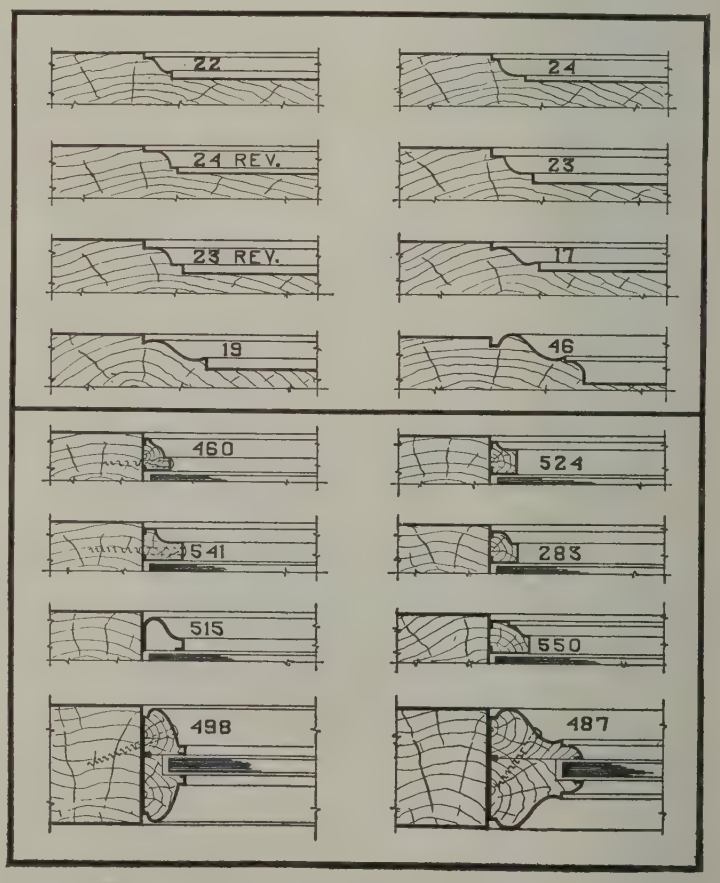


Fig. 3. A Few of Our Many Styles of Casings and Mouldings for Divided Light Panels

Continued on next page

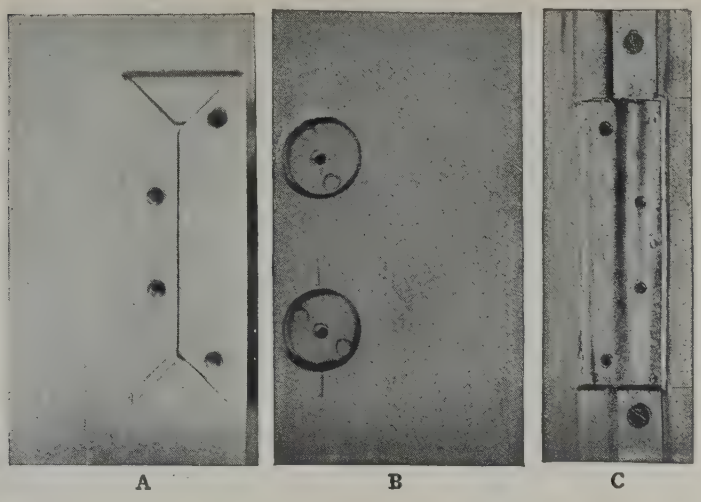

Fig. 4. Details of Hardware Reinforcement

A and B—Photographic section of the jamb at the butt seat, showing the sinkage of the washer nut on the back of the jamb.

C—Section of the back edge of a door showing butt sinkage

These methods are typical of the great care exercised by this organization that all details shall be as strong as possible to resist the action of hard usage and fire. Note that the metal is formed in under the butts

Hardware—All hardware, except checks, is fitted at the factory, provided it is delivered to us with all charges prepaid. In making the mortise seat for the hinge, the metal is not cut away, but formed into the mortise to protect the wood core on both the door and frame. The hinge jambs are suitably reinforced at all hinges to carry the door without any sagging. Necessary reinforcements are placed in the door.

Munt Bars—Our Munt Bar construction is the strongest possible, and the smallest. It consists of ⅛-in. steel bar of door thickness to which the mouldings are machine screwed. When hollow mouldings are used, they are made up in framed, welded units for each glass light opening.

Finish—All grained or enameled finishes are baked and are of the very best seven-coat type. We follow the architect's requirements for each individual order. Unless specifically stated otherwise, all work is primed. Copper-plated finish is electro-copper on steel and may be finished in the various shades of statutary copper. This is practical only for interior use.

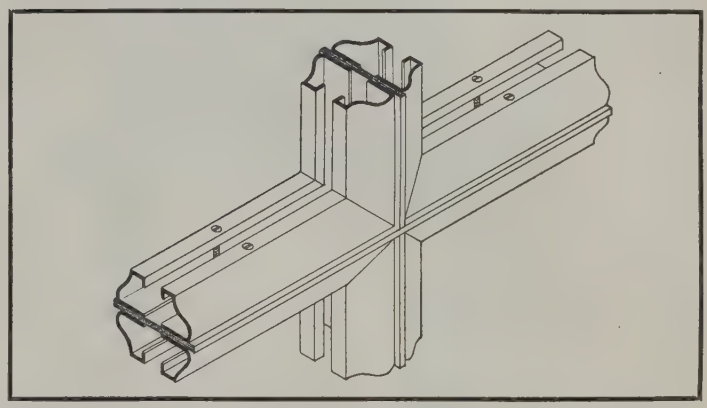

Fig. 6. The Thorp Method of Munt Bar Reinforcement
Insures complete and lasting rigidity in all divided light panels

Hollow Frames

Our frames are adaptable to any type of building or partition construction. They are either 16 or 14 gauge welded joints fully reinforced and fitted for hardware.

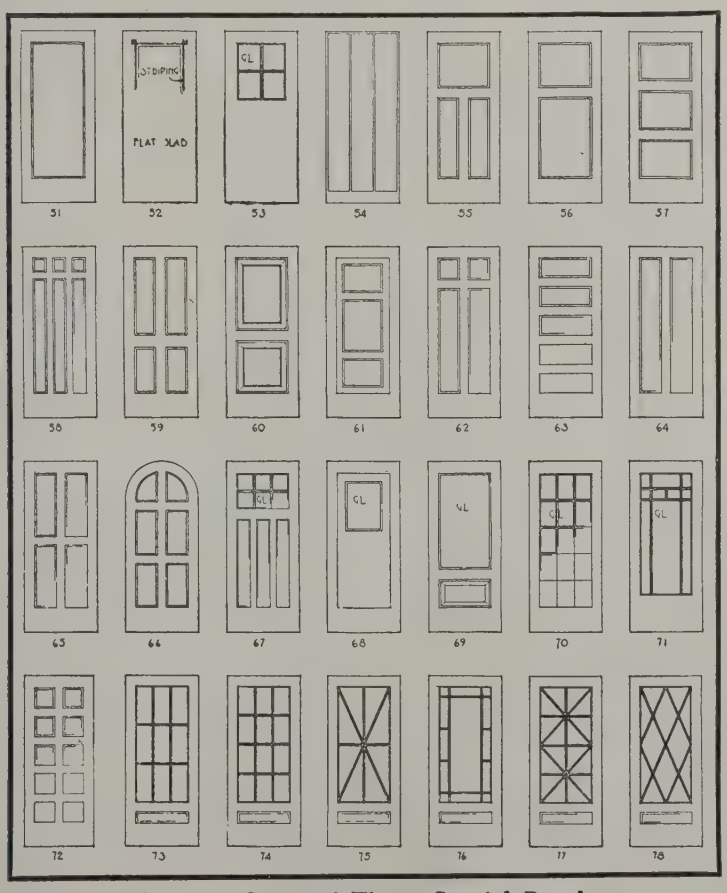

Fig. 5. Some of Thorp Special Panel Layouts

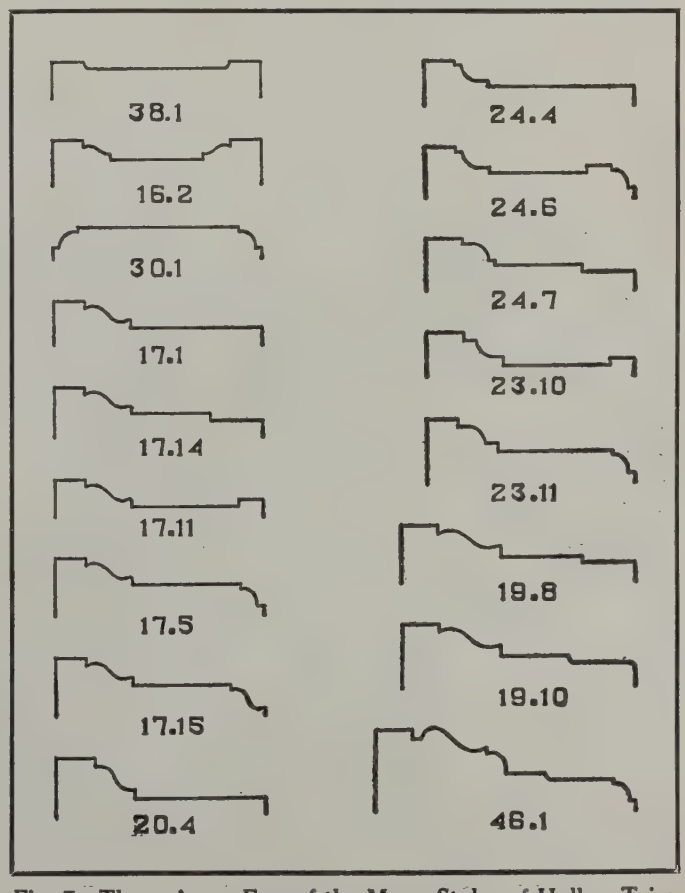

Fig. 7. These Are a Few of the Many Styles of Hollow Trim Architects May Specify

Continued on next page

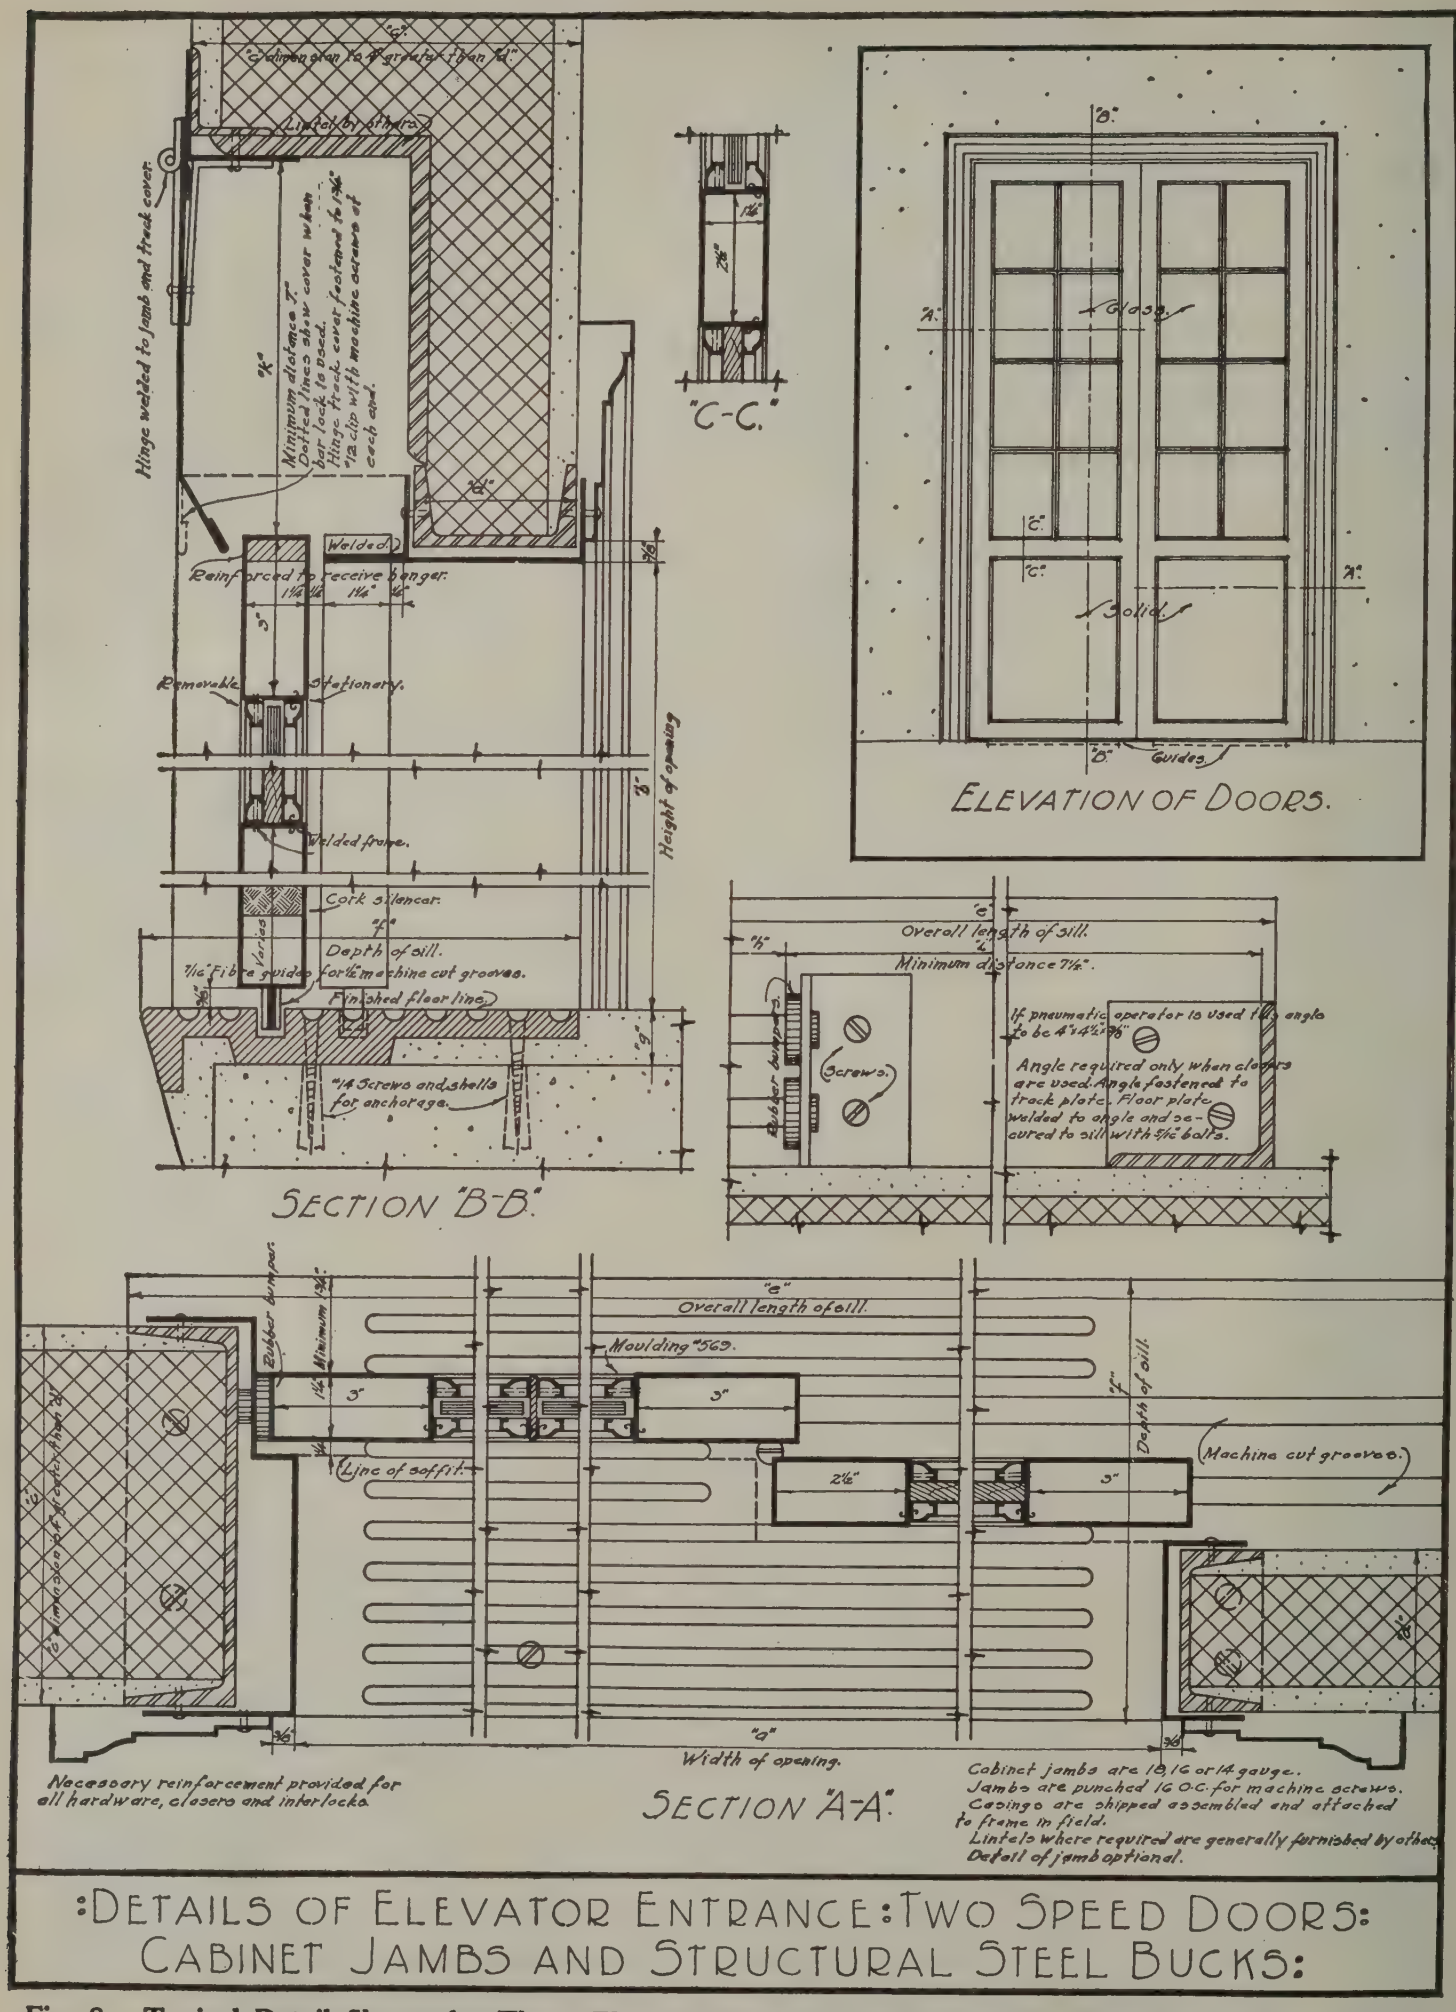

Fig. 8. Typical Detail Sheet of a Thorp Elevator Opening Installation—Note Methods of Construction

Continued on next page

Elevator Openings

These may be of metal covered or tubular steel construction. Tubular doors are 14 gauge drawn steel tubes with all mitres and joints welded. Glass mouldings are in welded frame units. This simplifies glass setting. The Thorp guide is the width of the bottom rail, preventing shaft drafts and light strikes.

The guide is lined both sides with a special grade of hard fibre, obviating metal-to-metal contact, adding to quietness and ease of operation.

We furnish the welded type of hollow metal frame and track cover or cabinet jamb type. Sills and hardware complete are also provided if desired. Sills should be machine grooved or of a similar construction. Elevator openings are finished in baked enamel in any desired wood grain or color. Otherwise it is factory primed.

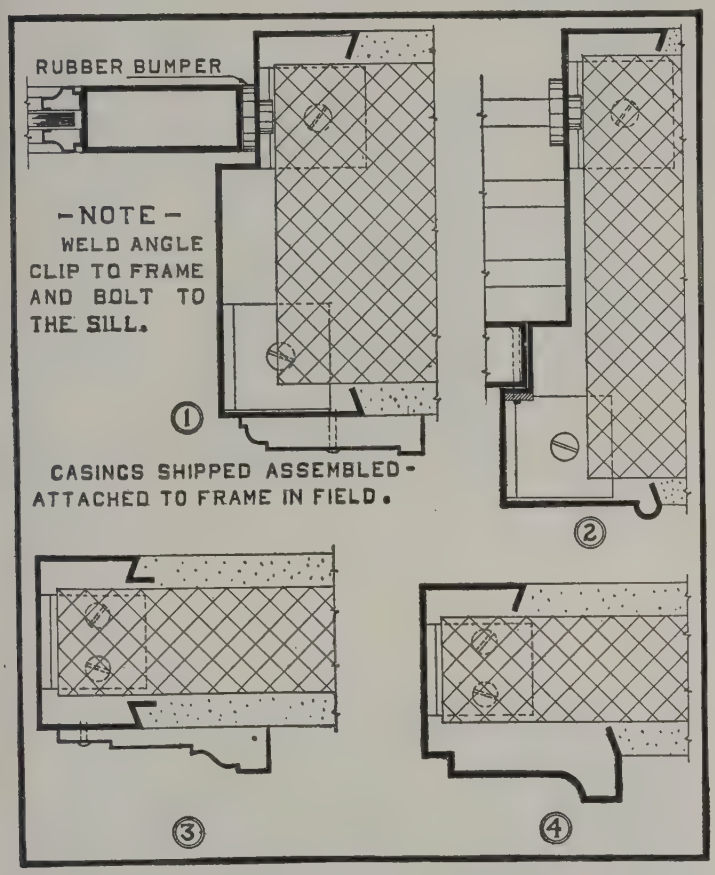

Fig. 9. Four Typical Thorp Elevator Opening Casings

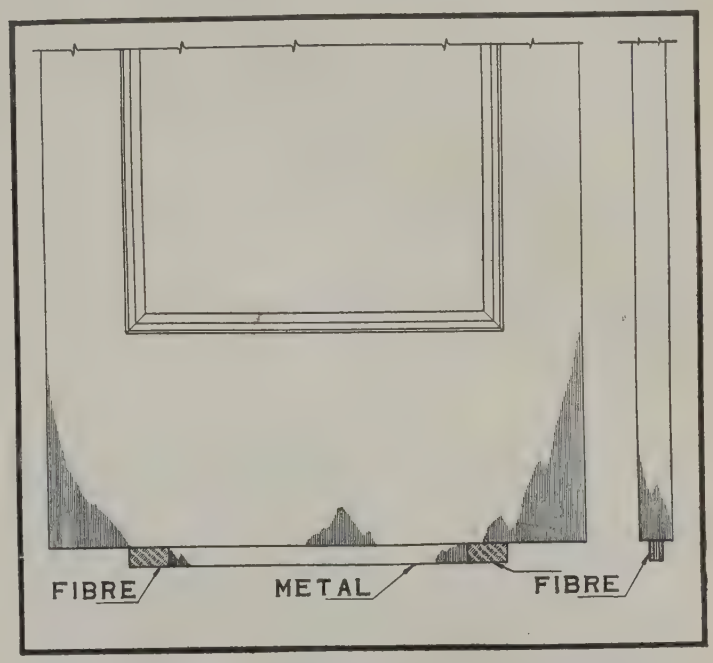

Fig. 10. This Illustrates the Thorp Method of Eliminating Light Strikes Below Elevator Doors and of Reducing Noise
Note hard fibre

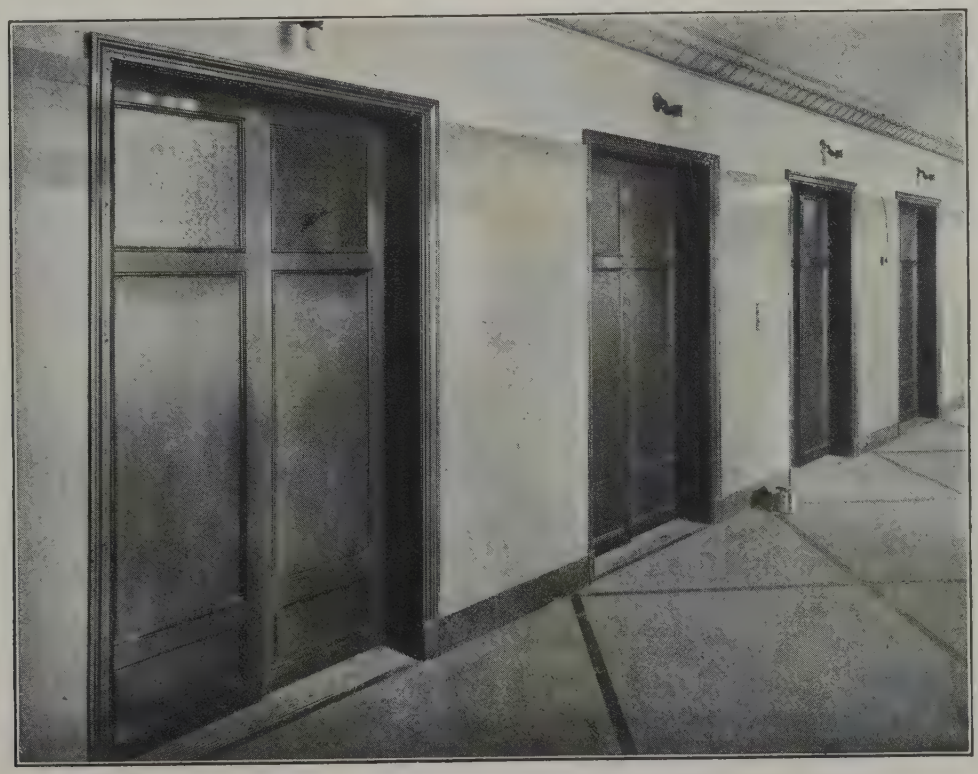

Fig. 11. Thorp Elevator Doors As Installed in the New Baker Building, Minneapolis, Minn.
Larson & McLaren, Architects

Continued on next page

Entrance Doors

Thorp bronze and copper entrances are especially suited to public buildings, such as office buildings, hotels, theaters, etc.

The construction is identical with Thorp steel covered doors except an inside lock seam joint is used instead of welding which is impossible in the case of bronze or copper. No solder is used.

Copper may be 18 oz. to 30 oz. Bronze may be 18 oz. (22 gauge) to 30 oz. (18 gauge). We also use 36 oz. (16 gauge) bronze in hair line joint construction as well as hollow bronze in 16 gauge.

Label Service

If called for, we label doors according to the National Board of Fire Underwriters' requirements for various types of openings. This should be specified when inquiring.

Catalogue

The reference book of Thorp Fire Proof Doors will be sent to any architect who will send for it on his firm stationery. This catalogue of 95 pages will furnish detailed and authoritative information on fire proof doors and allied products.

VULCAN RAIL & CONSTRUCTION COMPANY

Manufacturers of Underwriters' Fire Doors

MAIN OFFICE AND WORKS

Grand Street and Garrison Avenue, MASPETH, N. Y.

BRANCH OFFICE AND SHOPS: 39th Street and A. V. R. R., PITTSBURGH, PA.

Products

VULCAN "ALL-STEEL" FIRE DOORS.

For Pipe, Stair and Bridge Railings, Steel Gratings, Pipe Bends, etc., see pages A820-823.

Underwriters' Approval

The steel fire doors and frames manufactured by this company, and described below, are made in accordance with the specifications of Underwriters' Laboratories, Inc., are inspected by them and carry their Class "C" label.

TRADE-MARK

Vulcan "All-Steel" Fire Doors

Use—These doors are designed for the protection of corridor and partition openings. They are especially suitable for installation in compartment openings in furniture storage warehouses.

Equipment—This type door is furnished with buck and hardware complete, except padlock.

Construction—The entire door, frame and hardware is of steel construction, and all material is painted one shop coat before shipping.

The door sheet is made of blue annealed steel, securely fastened to an angle iron frame, suitable provision being made for expansion in case of fire. This angle frame is braced at intervals of not over 20 in. by cross angles riveted to the door sheet.

Hardware consists of four strap hinges and a three-point latch with spring to hold latches in their keepers. Latch handles extend through the door to permit opening from both sides.

Buck is made of standard rolled steel channel and is furnished 1 in. wider than partition. It runs from the finished floor to the ceiling and is securely fastened to both. Hinge pintles and latch keepers are riveted to channel jambs in the shop. Doors are usually made 3 ft. x 8 ft. 4 in. or 3 ft. 4 in. x 8 ft. 4 in. but can be furnished in any size up to 4 ft. x 10 ft.

Further Information

Complete detailed drawings, together with further information and prices will be gladly sent on request.

Plant and Facilities

U.M.P. doors are made in the largest plant in the world devoted exclusively to the manufacture of hollow metal doors, frames and trim. We are equipped to handle contracts of any magnitude, and, as our plant is located in the heart of the steel producing industry, we enjoy unusual facilities in deliveries of raw material. Our plant is equipped with the very latest machinery and our methods of producing the finest type of interior metal trim are most modern.

U.M.P. Standard Hollow Metal Doors and Trim

Stiles and Rails—Formed from U. S. Std. No. 18 gauge steel, thoroughly pickled, double annealed, patent leveled, free from blisters, pits or other imperfections. Stiles are formed of one piece and rails of two pieces, all interlocked with continuous channels constructed to form a reinforcing binder, a deep groove for panel and an interlocking clip for panel moulding (see illustration). All stiles and rails have cork inserts of suitable size to prevent metallic sound.

Doors are 1¾ in. thick.

Panels—Constructed of two sheets of U. S. Std. No. 18 gauge steel between which two sheets of asbestos and one sheet of felt are inserted to make panel ⅝ in. thick over all. Panels are inserted in the groove provided by the interlocking channels. (An exclusive feature of this product.)

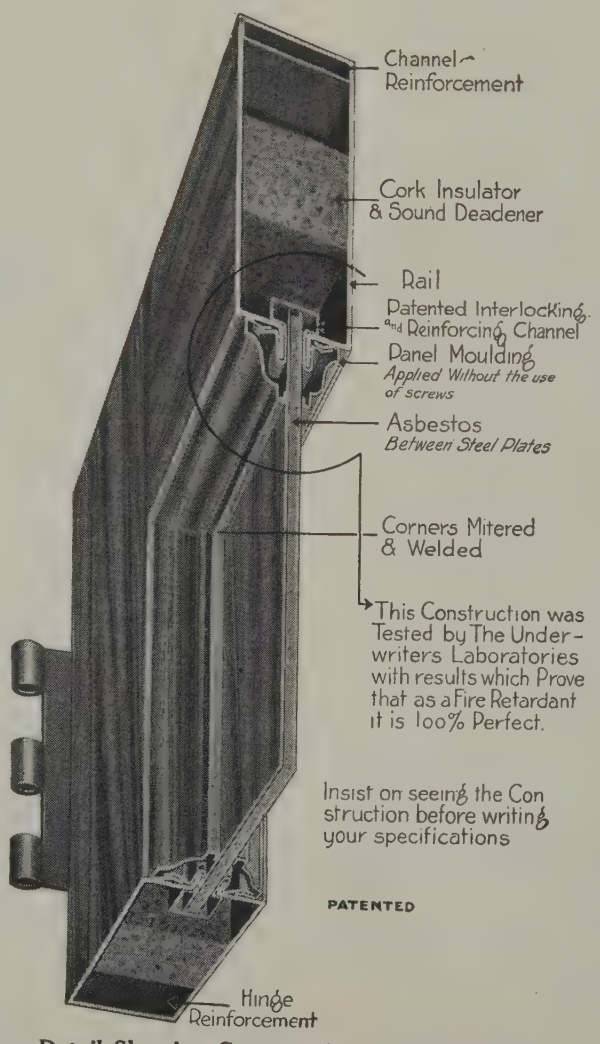
Panel mouldings are neatly mitered or coped at corners and intersections and clipped into interlocking member as described above.

All seams and joints connecting stiles and rails are oxy-acetylene welded their entire length. All joints are made perfectly level and invisible. Steel channels, placed at top and bottom of door full width, are spot-welded in place. Reinforcing bars of sufficient length and thickness are welded in hinge stile at all cut-outs, and are drilled and tapped for butts. Reinforcing plates are spot-welded in lock stile to receive locks, and additional reinforcements are placed in door to receive the hardware specified. All doors are reinforced for door checks, whether specified in hardware schedule or not.

No bolts or rivets are used and no screws are allowed, except where glass panels occur and then oval head machine screws are used to hold glass moulds or beads in place.

This construction has merited the approval of the Underwriters' Laboratories, Inc., it having withstood a fire test of unusual severity without the slightest indication of failure.

We invite investigation and inspection of the U.M.P. standard door and with special reference to the panel construction. Investigation will show as fire tests have proven, that the U.M.P. standard hollow metal door is a fire retardant without equal.



Detail Showing Construction of U.M.P. Door

Jambs—Made of the same quality steel as described for doors—U. S. Std. No. 18 gauge for walls 7½ in. thick or less; No. 16 gauge for walls exceeding 7½ in. thick. Notched and reinforced for all necessary hardware. Jambs are formed to detail and made to fit accurately over buck. All intersecting members are neatly coped and fitted before shipment.

Casings—Made from cold rolled strip steel of not less than .050 in. thick. A large assortment of sizes and profiles designed by architects is available for trimming the opening. All casing corners and miters are neatly welded and ground to insure invisible joints.

Transom Sash—Constructed of U. S. Std. No. 18 gauge steel, similar to doors, and properly reinforced for necessary hardware.

Rough Bucks—Usually made of U. S. Std. No. 14 gauge blue annealed steel. Intersecting joints are acetylene-welded and steel spreaders placed in bottom of all bucks. With rough bucks, we furnish adjustable crimped or corrugated anchors which can be built into the walls. Depth of buck is determined by thickness of wall, including plaster. Rough bucks receive a dip coat before shipment.

Unit Frames (Combined Buck, Jamb, Stop and Casing)—Made from U. S. Std. No. 12, 14, 16 or 18 gauge steel of the same quality described for doors (No. 16 gauge is standard). Hospital type bucks are No. 12 or 14 gauge, as required. All bucks and frames prepared for hardware and heavily reinforced where necessary. Unit frames receive one dip coat and one filler coat. Both coats baked on, after which a prime coat is applied and baked. Finishing coats of paint are applied at building by painting contractor.

Standard Finish—Inside of panels are painted before assembling. After fabrication the door is immersed in enamel. Enamel is then allowed to drain off, after which doors are thoroughly baked. A filler coat is then applied and baked, and the surface sanded or ground perfectly smooth. Two coats of high grade mineral paint are then applied, each baked on separately. All grained finishes receive two coats of best baking varnish, each coat baked on separately. All finished work is rubbed to an eggshell gloss.

Continued on next page

Jambs, casings and mouldings are finished in the same manner as the doors.

Hardware—Applied to doors at factory before shipment, except where crating of materials might be interfered with. Drilling and tapping for such items as doors and transom closers are done at the building by the erector after materials are installed.

Underwriters' Labels—The standard U.M.P. construction has been tested and approved by the Underwriters' Laboratories, Inc., and we have been granted the privilege of applying the Underwriters' label to all doors for corridor, room partition and fire escape openings.

We have also been granted the right to label fire wall doors made from No. 18 gauge steel and of hollow construction. Such doors are of the all-metal type and, while of special construction, they can be divided into any number of panels and grained to match any finish desired.

The U.M.P. fire wall door displaces the old fashioned tin clad type. It can be hung with ordinary butts to a regular standard No. 16 gauge jamb attached to a No. 10 gauge buck. The only item of hardware needed on the U.M.P. inspected fire wall door in excess of what is required on any other door is a 3-point lock.

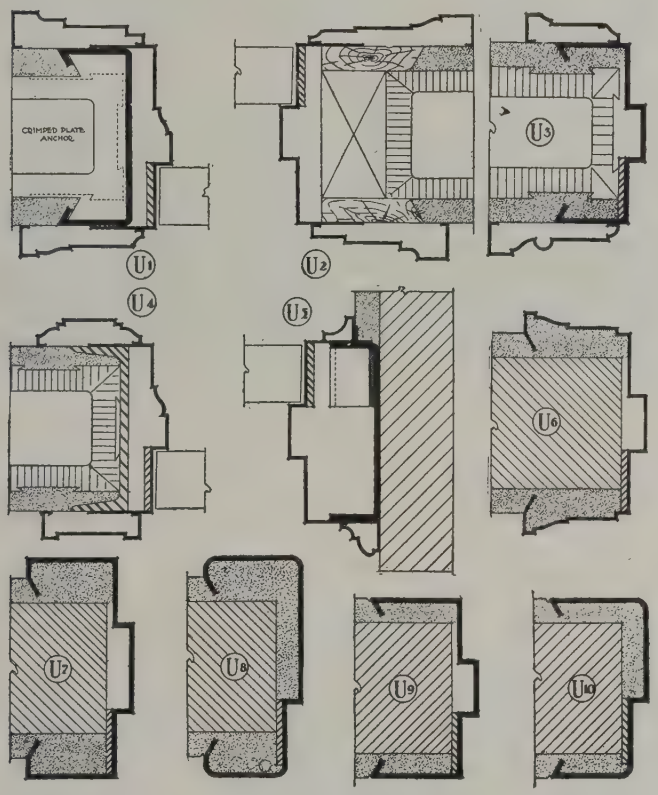
We furnish labeled doors and frames in any size up to and including 4 ft. wide by 8 ft. high for single doors, and up to 8 ft. wide by 8 ft. high for a pair of doors.

Shop Drawings—These illustrate all work in detail and are prepared and submitted for architect's approval before materials are fabricated.

Samples—We will furnish a corner section of this door and suggest that a comparison be made of its construction with the old system of a tubular stile and rail with the panel mouldings simply screwed or spot-welded to it.

Samples of finish are submitted for approval before materials are finished.

Architects' Handbook—Full size sections of all standard U.M.P. door mouldings and casings are shown in our Architects' Handbook, which will be sent on request, without charge.



Details of U.M.P. Standard Buck and Jamb Construction

Type U 1—Rough buck, cabinet jamb and casing construction.
Type U 2—Wood buck, cabinet jamb and casing construction.
Type U 3—Combination buck and jamb, with applied casing.
Type U 4—Channel iron buck, cabinet jamb and casing construction.
Type U 5—Inverted buck. Cabinet jamb and scribe mould construction.
Type U 6—Unit frame (combined buck, jamb and casing).
Type U 7, U 8, U 9 and U 10—Combination frames suitable for hospital or school construction.

Note: When materials must be finished before shipment, constructions shown for Types U 1, U 2, U 4 and U 5 may be used. Rough bucks can be set, walls built and plastered and finished materials installed after all other work is in place.

Type U 3 permits of a more flexible casing design than is possible in a standard unit frame. Casing can be made to match any design required.

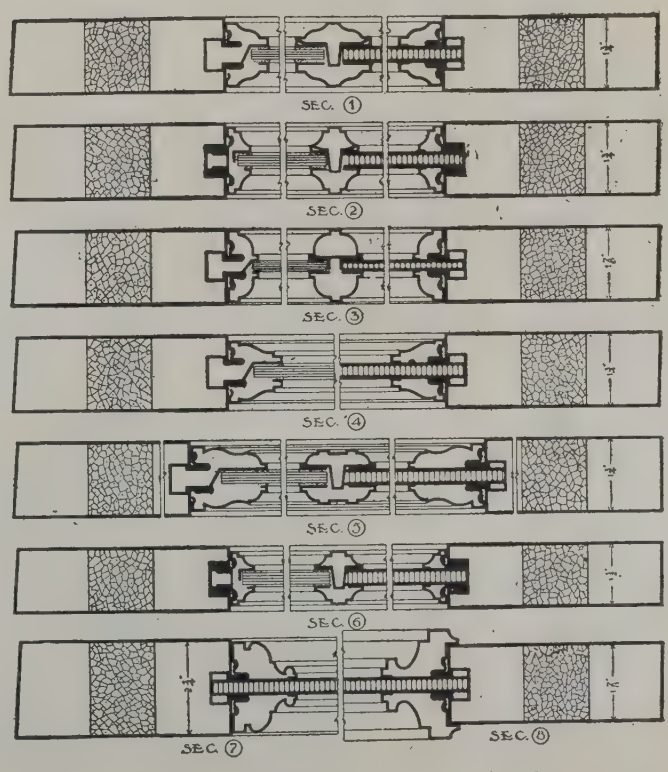
A considerable saving can be effected in cost by specifying construction shown for Types U 6, U 7, U 8, U 9 and U 10.

Unit frames must be built into masonry and should not be shipped to job with finishing coats applied. This work should be done by painting contractor.

We can furnish Underwriters' labels for all types of construction shown with the exception of U 2 and U 5.

Crimped plate anchors furnished with all combination frames.

Standard U.M.P. Hollow Metal Doors



Standard U.M.P. Hollow Metal Door Sections

Continued on next page

Metal Mouldings

We manufacture a complete line of metal mouldings, including picture moulding, wire moulding, scribe enclosure moulding, muntin moulding, chair rail, base, cornices and handrails, which can be furnished promptly in any quantity. These are made from .050-in. cold rolled strip steel.

Special steel or bronze shapes, cold rolled or pressed, can also be furnished.

A large assortment of styles is shown in full size sections in our Architects' Handbook, a copy of which will be sent on request, without charge.

Elevator Enclosures

Doors—Construction of United elevator doors is the same as that of the standard U.M.P. hollow metal doors described on the two preceding pages, except that they are 1½ in. thick and are provided with special noiseless easy-sliding guides at bottom of door to run in sill groove.

Frames—May be of either rough buck, cabinet jamb construction, or of the combination frame type, heavily reinforced for attachment of hardware. Crimped plate anchors furnished with all combination frames and rough steel bucks.

Trim—Made from No. 18 gauge strip steel of stock design or profile, and fastened to frame with concealed clips.

Cover Plates—Protect hangers from dirt and dust. Made of No. 14 or 12 gauge steel, depending on size. Provided with hinges and latches for easy access.

Facia Plates—When specified, Nos. 14 or 12 gauge facia plates are furnished, extending from top of cover plate to sill above and 6 in. wider on each side than jamb opening. Numerals furnished when specified.

Sills—Furnished in either cast iron with fluted surface, or Feralun sills with grooves milled straight and true, in order that the friction of guide pin and groove be reduced to the minimum.

Hanger and Closing Device—Furnished in the type specified. We suggest careful choice in this specification, as poor equipment of this nature will ruin an otherwise perfect installation.

Underwriters' Labels—United elevator enclosures, including doors, bucks and jambs, can be furnished with Underwriters' labels, except enclosures having glass paneled doors.

Owing to varying construction, it is necessary to mention distinctly in the specification that the elevator doors are to bear the Underwriters' label and be manufactured in accordance with the standard construction of United Metal Products Company.

Elevator Specifications—Complete elevator specifications and list of prominent United installations will be mailed on request.

Standard Types of United Elevator Doors

Where two designations are shown for one type, the following applies to panel arrangement:

E 1—Two-panel, all metal
E 2—Two-panel, upper glass
E 3—One metal panel
E 4—One glass panel
E 5—Two-panel, all metal
E 6—Two-panel, upper glass
E 7—Two-panel, all metal
E 8—Two-panel, upper glass

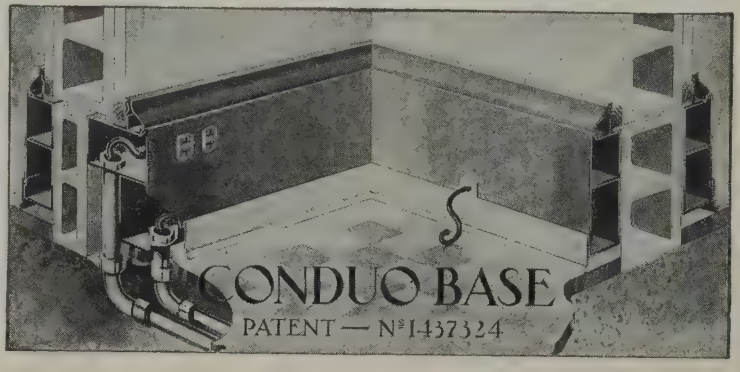
Conduo-Base—Combined Base and Conduit

Conduo-Base serves both as a baseboard and as a raceway or conduit for electric light, telephone and other wires. Conduo-Base is not intended to replace the entire conduit system in a building, but is an extension of that system.

High and low tension feeder conduits located in the floor fill and running from cable shaft or panelboard, are extended to and connected with the Conduo-Base at any convenient point. The wires are then carried around the room in the Conduo-Base and are accessible for outlets at any point along the base. Outlet boxes for the reception of feeder conduits are attached to the raceway, knockouts being provided in these boxes to receive feeder conduits.

Strictly fireproof—every section bears the Underwriters' label. One standard height, 8¼ in. over all.

Raceway—Made of one piece of No. 18 gauge steel and formed into two separate compartments. The upper compartment is used exclusively for light or power wires up to 300 volts; lower compartment for telephone or other low tension signal or communicating wires. Shipped in 10-ft. lengths.



Cover Plate—Made of No. 18 gauge furniture stock steel. Easily removed when additional outlets are required or when access to raceway is desired. Shipped in 10-ft. lengths.

Plaster Mould or Top Member—Made of .050-in. strip steel. Easily clipped in place. No screws or other visible fixing required. Shipped in random lengths of about 15 ft.

Mop Mould or Bottom Member—Made of .050-in. drawn strip bronze. Rests on floor and provides protection against damage to base when floors are swept or scrubbed. Drilled on 15-in. centers and fixed to raceway with round head machine screws (drilling and tapping of raceway done at building). Shipped in random lengths of about 15 ft.

Fittings—Grounding clips, end closers and plaster mould clips are furnished by us with each order.

Finish—All exposed surfaces of Conduo-Base are finished to match sample furnished by architect.

Especially Desirable for Subdivision—When United Metal partitions are used for the subdivision of space, Conduo-Base is especially desirable in that it serves both as a neat, artistic and sanitary base for the

Continued on next page

partition and as a conduit for distribution of light and telephone wires within the rooms. The *combined use of United Metal Partition and United Conduo-Base* simplifies the task of the architect and the building manager in providing for future tenant wiring requirements. The convenience and economy resulting make the use of Conduo-Base desirable and necessary.

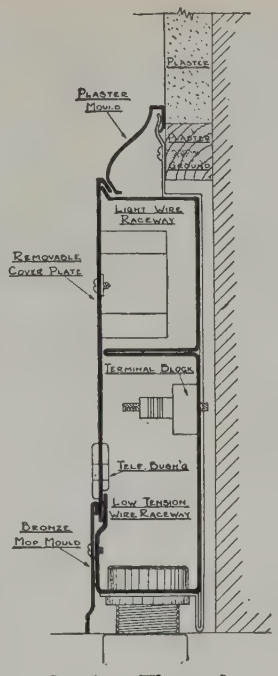
How to Specify—Furnish and install Conduo-Base in all rooms and spaces throughout the building where base of other types is not shown or specified. Base shall be UNITED METAL PRODUCTS COMPANY'S standard patented Conduo-Base, each section bearing the Underwriters' label. All exposed surfaces shall be finished to match sample furnished by the architect.

Conduit Work for Conduo-Base—Extend from each light switch outlet box, one ¾-in. feeder conduit to the upper section of special outlet box which is attached to and forms part of raceway. This box shall be furnished by the Conduo-Base manufacturer. Extend from the nearest low tension panel or junction box at least one ¾-in. feeder conduit to each suite of rooms, connecting same to the lower raceway of outlet box mentioned above.

Note: It is recommended that the above conduit feeders be made at columns, outside walls or permanent partitions where same are not likely to be removed by changes or rearrangements of suites of rooms. Feeder conduits of both light wire and low tension wires to Conduo-Base should be made of number and size so that each isolated run of Conduo-Base or each suite of rooms has ample and independent feeder capacity.

At every door opening, low-set radiator and every other point where the continuous run of Conduo-Base is intercepted by an opening or otherwise, "jumper" both raceways of Conduo-Base with ¾-in. conduits across the opening or interception so that each isolated run of Conduo-Base in every suite of rooms is properly connected with the section of Conduo-Base equipped with the feeder conduits.

Note: Where "jumper" conduits terminate in partitions that are likely to be removed at a future date, we recommend the use of cast elbows and nipples, with the conduit proper finishing at floor level so that it can be capped.



Section Through Conduo-Base

For each light or low tension wire floor outlet shown, extend one ¾-in. conduit "jumper" from the nearest Conduo-Base run, and from its proper potential raceway, terminate same at floor with its axis perpendicular to same, with one adjustable floor outlet fitting with blind cap.

Conduo-Base Installation—After completion of plastering and floor work, install Conduo-Base in the following manner. Attach raceway to plaster ground with round head wood screws through clips which are spot-welded to raceway, special care being exercised to maintain true alignment, elevation from floor and projection from plaster line, in strict accordance with manufacturer's full size details.

When all raceways are installed, wiring in same completed and approved, install Conduo-Base finishing members in accordance with manufacturer's standard directions, with all exposed joints well made, corners neatly fitted and finished surfaces kept unmarred in strict cabinet quality of workmanship.

Electrical Requirements—The entire installation of Conduo-Base shall be made in strict accordance with the Underwriter's rules and regulations, with continuous unbroken grounding of every isolated run of base, with all wiring within free from grounds.

United Metal Partitions

We have perfected and patented an inexpensive metal partition for subdividing office and warehouse space.

Panels are made from two sheets of furniture stock steel, with a layer of asbestos between and joined together under hydraulic pressure. Mullions, and top, bottom and intermediate rails are of hollow construction, all drawn to detail with sharp reveals and pleasing architectural profiles.

Bottom member of partition can be fitted to receive Conduo-Base where desired, so that electric and telephone wires may be distributed throughout the rooms without the necessity of floor conduits, thus enabling the contractor to install finished floors and ceilings throughout the entire floor, subdividing the floor space afterward to suit tenant requirements.

United partitions can be set up and taken down without damage to walls, floors or ceilings. Parts can be moved and stored in a very small space and reset without damage to finish or waste of material. Adjustment to varying conditions is a special feature.

The high cost and scarcity of building labor, together with the inconvenience and expense of pulling down and rebuilding tile and plaster walls in an occupied office or warehouse building, make it imperative that the architect and owner investigate the United partition before deciding on the type of subdividing wall material to be used.

United partitions are made from cold rolled shapes, the members of which are fabricated at our factory and shipped to the job knocked down. The various members are prepared so they can be easily and quickly locked together on the job.

Universal Passenger Elevator Doors

Type V. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type V. U. passenger elevator doors are constructed of No. 18 gauge furniture metal throughout, with all connections between stiles and rails formed by continuous lock joints and solidly welded over entire length of joint. Finish is either air dried, baked enamel in any color, or grained to match any kind of wood finish.

Type M. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type M. U. passenger elevator door construction is similar to V. U. type except that both shaft and corridor sides of door have recessed panels finished against stiles and rails with drawn mouldings mitered and welded. Finish is either air dried, baked enamel in any color, or grained to match any kind of wood finish.

Type T. U.—VARIETY FIRE DOOR COMPANY'S "Universal" Type T. U. passenger elevator doors are constructed of rectangular tubes drawn from No. 14 gauge cold rolled strip stock and welded. All connections between stiles and rails are formed by continuous lock joints and solidly welded over the entire length of joint. Finish is either air dried, baked enamel in any color, or grained to match any kind of wood finish.

Universal Passenger Elevator Doors

Specifications for Counterbalanced Freight Elevator Doors—Vamanco Varclad Doors

(1) Freight Elevator Doors—All door openings to freight elevator, except penthouse doors, shall be counterbalanced doors as sold by Variety Fire Door Company and shall be type known as [Vamanco] [Vamanco Hollow Metal] [Varclad] [Varclad Kal-O-Mine].

(2) Work Furnished by Manufacturer—The manufacturer shall furnish, freight allowed to freight station nearest building site: (a) all doors complete with guides, roller bearing sheaves, bar locks, trucking sills, bolts, anchors and all necessary hardware to properly secure doors to walls of shaft; (b) drawings and full directions required for erection; (c) all parts to receive priming coat of metallic paint at factory.

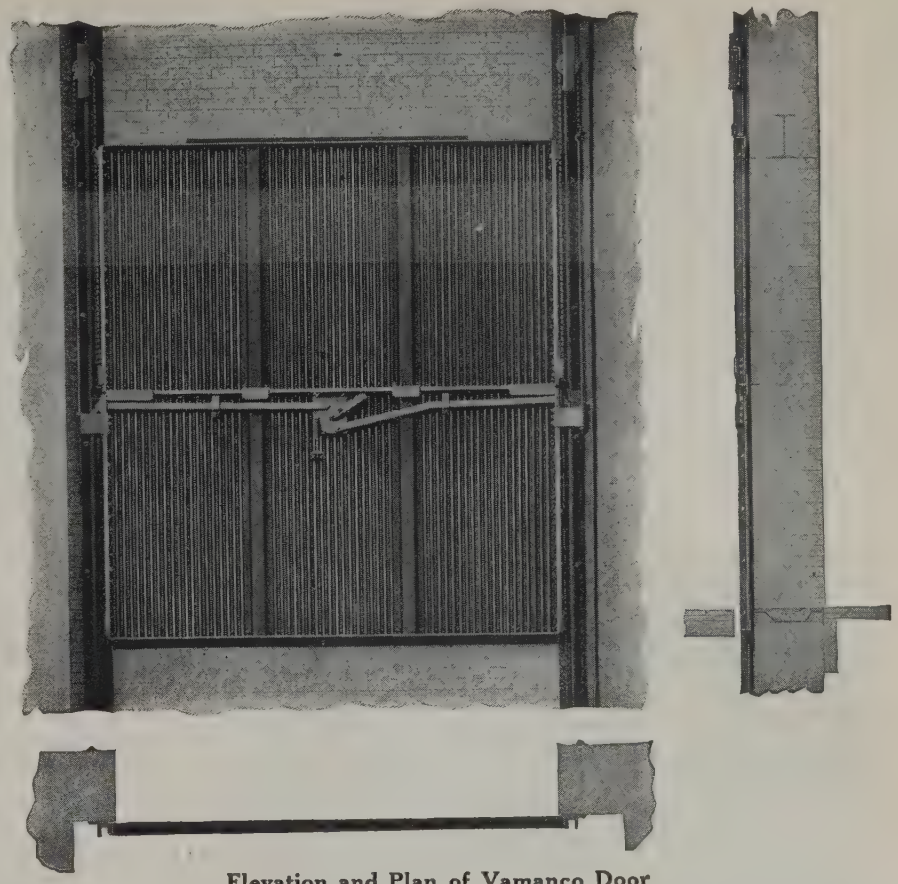
(3) Underwriters' Label—All doors shall be approved and labeled by Underwriters' Laboratories, Inc., for "Fire Door for Vertical Shaft."

(4) Special Lock—Special lock shall be provided at (ground) floor to permit access to elevator shaft when all doors are closed.

(5) Operation—Doors to be manually opened and closed: (a) If electric interlocks are desired add: Each door to be provided with a Varlock operated by bar locks so that when door is *unlocked* the current will be cut off from the car and it will be impossible to run the car until all doors are closed and locked. (b) If full automatic operation is desired add: Door contractor to furnish mechanical operating device to open and close doors automatically by simply pressing button when car is at landing. This device to be full circuit type and to contain interlocks cutting current from car when door is unlocked.

(6) Trucking Sills—All doors shall be provided with special design trucking sills (state if for heavy or light duty) so that no part of load passing over doors will be sustained by door mechanism or guides, but will be carried entirely by sill of building.

(7) Glass Panels—Each door shall be equipped with a panel 12 in. square, arranged to receive ¼-in. wire glass (glass by glazing contractor). The glass panels are to be backed by a sliding metal panel, with fuse link for automatic closing and doors must bear the Underwriters' label.

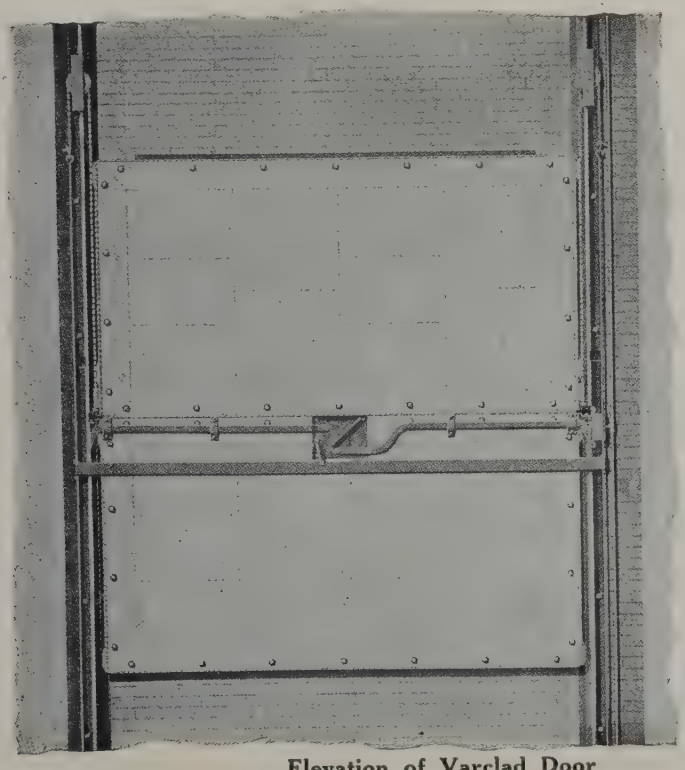


Elevation and Plan of Vamanco Door

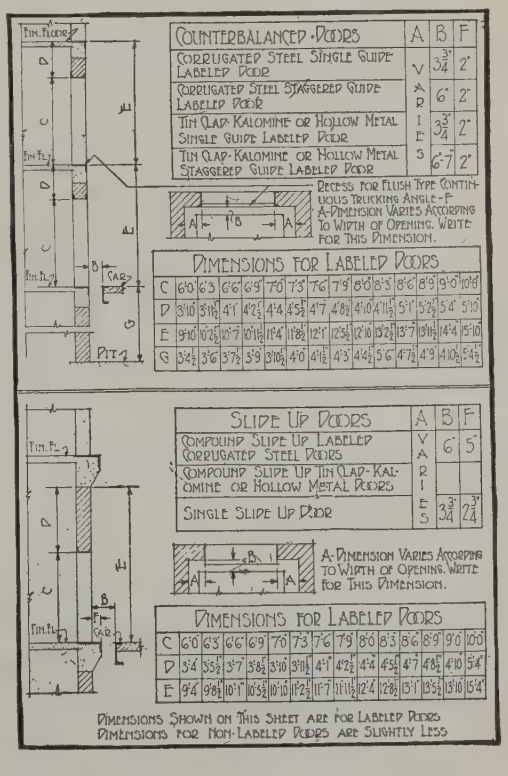
(8) Clearance—There shall be not more than 1½-in. clearance between door and elevator car at all floors. In case there is any inequality of construction of shaft that will not allow this, the architect will decide whether to cut the masonry or put extension on doors to make correction of same, which is to be charged to contractor who built the shaft.

(9) Erection—The manufacturer shall erect the entire equipment in a substantial manner and shall leave the installation in perfect working order.

(10) Painting—The contractor shall apply 2 coats lead and oil paint to all parts exposed to view, in colors selected by the architect, as specified under "painting."



Elevation of Varclad Door



R. V. HARTY CO.

Manufacturers of Special Doors for Large Openings

1316 Maple Street

DETROIT, MICH.

R. V. Harty Doors

R. V. Harty doors and hardware have been developed in answer to the call for sturdier, quicker and easier operating, more reliable entrances to modern garages, warehouses and factories. R. V. Harty doors are designed for openings where continuous performance is a necessity.

R. V. Harty slide doors are designed to be weathertight and to give continuous heavy duty service.

Construction details of the door have been developed to produce the best possible door for strength and for resistance to warping, rotting, splitting and sagging.

A Typical Installation

Description and Advantages of R. V. Harty Door Hardware

Full Ball Bearing—Note on the following page the assembly details of R. V. Harty 6-in. hardware. The lower barrel of each pintle is equipped with a combination radial and thrust bearing and the upper barrel with a radial bearing. The entire weight of the door is thus supported on these bearings which are never loaded beyond 50% of their rated capacity.

Equalization of Load—The combination bearing is supported on a spring which, if the hardware were carefully installed, would suffice to nearly equalize the load on all hinges, but in order to insure each bearing taking its share of the load a compensating screw plug is inserted to support the spring. This allows of very accurate distribution of the load among all bearings. A setscrew holds this plug from turning, thus insuring permanent adjustment. The compensating effect of this screw plug is obtained in the 2½-in. hardware by means of the slotted holes in the pintle.

Lubrication—In each barrel there is considerable dustproof space which is filled with a non-corrosive grease at the time of erection; thus the bearings are permanently lubricated.

Alignment of Hinges—Unit line construction of the hinge is obtained by direct connection through steel of the main hinge eye and the fold hinge pintle as shown on the hinge detail sheet. The Z-bar casting which contains the main hinge eye is welded to a steel plate, the other end of which is welded to the fold pintle. This is done in a jig insuring all hinges being exactly alike. This, together with our method of installation, insures perfect alignment of both main and fold hinges and precludes the possibility of the door being "hingebound."

Clearance—The doors are cut 1¼ in. clear of the floor to prevent jamming over small obstacles on the floor. A rubber sealing strip is applied to close this opening. We would also call your attention to our combination rubberized fabric belt and steel plate astragal at the center of the door.

Other Advantages—The latest developments of jigs and fixtures used in the manufacture insure perfect fit and alignment of all units. It is not just hardware, but a complete unit, scientifically designed and engineered for a specific purpose.

The R. V. Harty unit line, spring compensated, and ball bearing hardware for folding doors shown on these pages is the latest development in hardware.

The unit line principle which combines the jamb eye and the fold pintle in one unit built in a jig insures perfect alignment of hinges. The ball bearings insure easy operation and the spring compensation which distributes load on each hinge equally, insures the owner against cut out bearings due to overload. A large lubricant space is provided, and the slight up and down movement of the compensating springs keeps this lubricant worked through the bearings. The complete weight of the door is carried on the jamb and the free end of the swinging door guided by our patented control rod.

The door construction shown is a product of experience and will give years of service without deterioration.

Operation

Doors are designed for either hand or power operation. We work with all of the operator companies; in fact, most manufacturers of operators demand our doors and hardware to insure a perfect installation.

A control rod is used to guide the free end of the folding leaf. This type of control is positive; it holds the free leaf of the door clear of the opening, and prevents jamming when door starts to close. It is one of the most successful methods of controlling the free end of a fourfold door for power operation.

Service

R. V. Harty doors and hardware are furnished and erected complete by the manufacturer. The complete installation is guaranteed for a period of two years.

We believe in dependability and service—service when you are designing the building, service in the erection of the building, and last but not least, dependability of operation for the life of the building.

We have no cure-all for all door troubles. Write or take up your requirements with our representatives, and we can and will give you practical solution of your problems.

Write for catalogue and list of users in your locality.

"For openings where service and dependability is paramount, specify and use R. V. Harty equipment."

Products

PEELLE COUNTERBALANCED TRUCKABLE FREIGHT ELEVATOR DOORS; TEL-CO DOORS; ACCESSORIES for Push Button Controlled Elevators; ELECTRICALLY OPERATED DOORS.

Also Bi-fold Doors, Canopy Doors, One-piece Vertical Sliding Doors; Electric and Mechanical Interlocking Systems, Pneumatic and Electric Door Operators.

For Peelle Dumbwaiter Doors, see page C3728.

Experience and Service

The high regard in which Peelle Products are held by architects and owners is evidenced in the fifteen thousand installations of Peelle Doors in various industries over a period of twenty years of economical service.

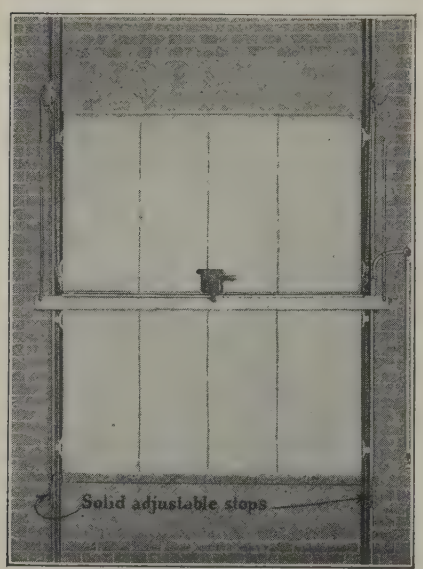
In the further advancement of "elevator door efficiency" our Engineering Staff will be glad to render advice without obligation concerning special conditions or problems of installation. Do not hesitate to "put your elevator door problems up to Peelle."

Estimates will be cheerfully provided.

Counterbalanced Freight Elevator Doors for All Types of Elevator Enclosures

Peelle Counterbalanced Elevator Doors are adaptable to practically every freight elevator door requirement. Their ease of operation and enduring construction have been proven by over twenty years of satisfactory service. Peelle Doors have been specified by architects for thousands of buildings.

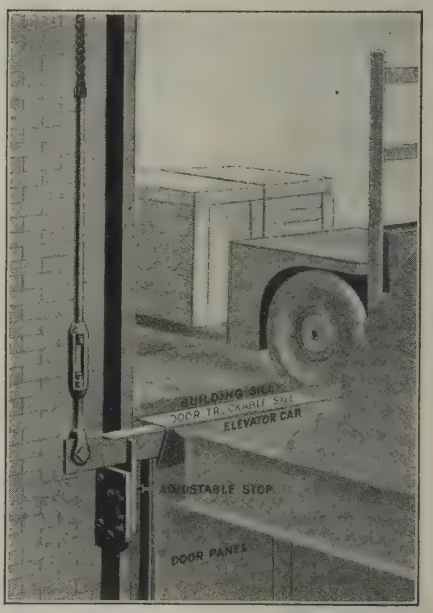
Counterbalanced, Peelle Doors operate vertically inside the elevator shaft affording rapid and full clearance for loading and unloading. No counterweights are used. Anti-friction construction; heavy sheaves provided with double race ball bearings; heavy steel guide rails; smooth running steel chains; large latch handle; balanced design of component parts; all assure smooth mechanical action of Peelle Doors.



Shaft Side View of Peelle Counterbalanced Door

In addition to economically speeding up the handling of vertical traffic, Peelle Doors protect the elevator shafts against accident and the spread of fire. Numerous Peelle Doors installations are equipped for greater efficiency with electric motors controlled by push button switch in car or on shaft side of door. They are also equipped for greater safety with electric interlocking system preventing movement of car until all doors in shaft are closed. Experienced Peelle erectors install each door, making fault-proof operation certain. Consult our Engineering Department before specifying the type of operation.

The Exclusive Truckable Feature—One of the cardinal features of Peelle Freight Elevator Doors is the *truckable* sill. It bridges the gap between door opening saddle and the elevator car. This gap ranges from four to six inches. The upper edge of the lower half of the door rests rigidly level with the building floor sill. Besides being specially reinforced to stand the heaviest trucking into and out of elevators, this bar extends beyond the sides of the panel of the door thus forming a bridge for smooth trucking.



Shaft Side View Showing Manner of Supporting Peelle Counter-balanced Door in an Open Position

Inasmuch as this sill rests on heavy steel stops fastened to the guide rails, there is always perfect and rigid alignment of the building floor and the trucking sill of the door. This *trucking* sill is endorsed as one of the most essential, simple and efficient features in elevator door construction.

Special Heavy Duty Sill—We also make a reinforced trucking sill for unusually heavy loads. It is also recommended for openings of great widths.

Continued on next page

Peelle Metal Clad Counterbalanced Doors

The basis of this metal clad door is composed of two layers of ⅞-in. selected white pine, clinch nailed together and covered with 24 gauge stretcher leveled galvanized sheets.

Framework is constructed of heavy angle steel which gives the door great strength and the ability to withstand severe use.

The angle frame and the metal covered panels are bolted together with patented combination lock nut washers, which finish flush on both sides of the door.

Large (patented) anti-friction shoes operate in heavy angle steel guide rails, rigidly fastened to masonry wall construction.

Peelle steel operating chains are permanently locked in place with patented locking device.

These chains operate over double radial ball bearing sheaves, permitting free, easy operation of even extremely large doors.

Drop forged steel adjustable turnbuckle rods aid fine adjustment.

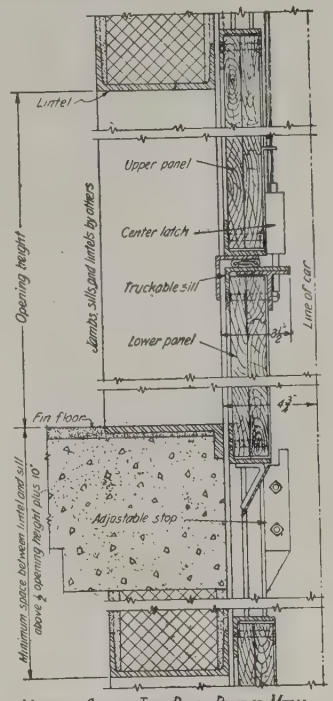
A positive action latch located at the center of each door is so designed that a slight pressure releases doors and exerts the greatest possible vertical pressure.

Where greater safety is required in connection with electric inter-locking switch, special arm latches (type E switch) will be furnished if specified.

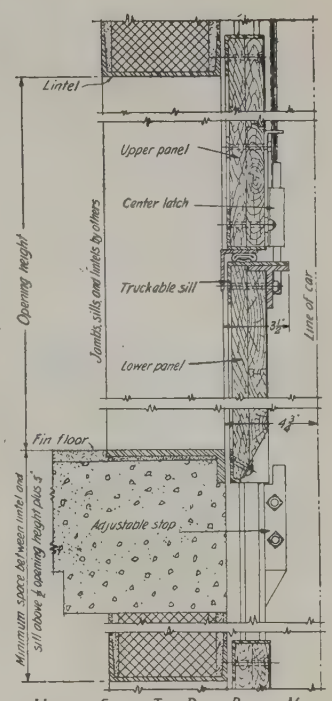
These doors have passed the rigid tests and inspection of the Underwriters' Laboratories Inc., and bear their label.

Labeled doors may not exceed 8 in. width and 10 in. in height.

Label of Factory Mutual Companies should be specified by owners carrying this fire insurance.



VERTICAL SECTION THRU PEELLE REGULAR METAL CLAD (UNDERWRITERS' LABELLED) DOOR



VERTICAL SECTION THRU PEELLE REGULAR METAL CLAD (NON-LABELLED) DOOR

Note: Minimum return from face of jamb to sidewall of shaft is 7 in.

Peelle Pass Type Counterbalanced Doors—Underwriters' Labeled

For openings where story heights are too low to accommodate regular type doors.

These Pass Type doors are demonstrating their excellence by widespread use in factories, garages and warehouses having high door openings and where constant and heavy traffic subjects the doors to heavy use.

The Pass Type door embodies all of the features of the Peelle regular type door as described above. The panels are staggered and operate on separate guide rails. When opened the upper panel of the door is permitted to pass by the lower panel of the door on the floor above, the lower panel likewise lapping the upper panel of the door on the floor below. (See details (A).) A movable, gravity operated, fire retarding steel lintel set on the upper edge of the door, effectively seals the opening between masonry and door.

Detail (B) applies to elevator shaft conditions where story heights are not uniform; one floor permitting the use of Peelle Regular Type Doors, and distance between other floors being less, Pass Type Doors are required. Also where door heights vary and floor heights are uniform, Peelle Pass Type and Regular Type doors are used in conjunction with each other.

Regular and Pass Type Doors are installed one above the other to cover both these conditions. An extended trucking sill is provided on the Regular Type Doors to bridge the clearance between elevator car and building floor sill.

The Underwriters and Factory Mutual Companies label will be furnished with all Pass Type doors when specified.

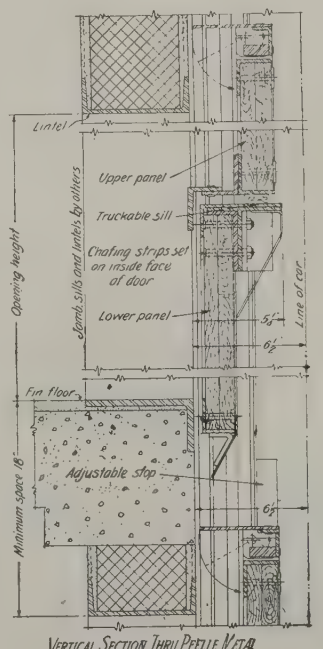
Elevator Shaft Construction Data—All details show the construction of Peelle Freight Elevator Doors when fastened to iron bucks. If no iron bucks are provided, and the jambs are of plain brick or concrete, the angle rail is reversed and the horizontal leg is bolted to the wall with through bolts. The construction in all other details remain unchanged. While Peelle Doors can be attached to walls of any construction, best results are obtained when channel or angle iron bucks securely anchored to the wall are provided. Plain terra cotta walls do not offer secure anchorage. The elevator shaft wall should be plumb and free from projections on the side at which the doors are to be installed. The openings should be built with the jambs flush with wall and in vertical alignment. Angle or channel jamb must be provided and set to reinforce hollow tile walls and should extend from sill to beam. Pressed metal bucks must be reinforced with internal angle on shaft side for fastening of Peelle rails.

If doors are installed directly above the elevator pit, it is necessary that the latter be deep enough to receive the lower half of the door in its descent. The requirement is a distance equal to half the height of the opening plus 3 in. No projection should be allowed for a similar distance above the lintel of the doors on the topmost floor.

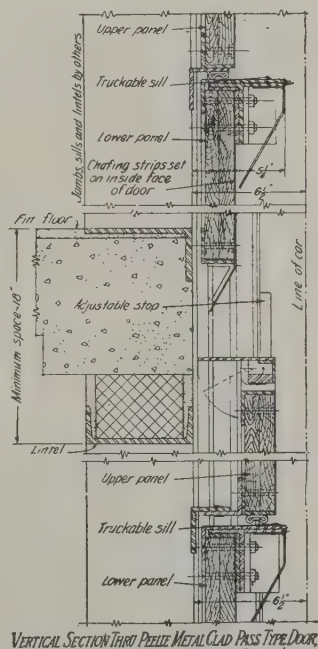
Door Clearance Formula—To determine minimum distance from lintel of door opening to finish floor line above add 10 in. to one-half of door opening height for regular labeled counterbalanced doors, and 5 in. for regular non-labeled counterbalanced doors.

For Pass Type Counterbalanced Doors minimum space, 18 in. from lintel to finish floor line above.

Door openings 12 ft. 0 in. to 16 ft. 0 in. in width should have 9 in. clear jamb return on shaft side of wall for fastening of hardware. Doors over 16 ft. 0 in. in width should be provided with 11 in. jamb return.



VERTICAL SECTION THRU PEELLE METAL CLAD PASS TYPE DOOR



VERTICAL SECTION THRU PEELLE METAL CLAD PASS TYPE DOOR, SHOWING EXTENSION SILL ON REGULAR DOOR ABOVE

Note: Minimum of return from face of jamb to sidewall of shaft is 8 in.

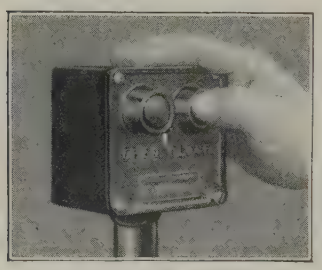
Peelle Electrically Operated Doors

Peelle Electrically Operated Doors have been developed to a high degree of efficiency and are recommended for speeding up door operation and in freight elevator shafts with door openings at both ends of large cars. In factories, storage buildings, warehouses, market buildings and department stores where cars are used requiring door openings at two ends, Peelle electrically operated doors have proved their worth as time savers and aids to the economical loading and unloading of freight elevators.

Peelle electrically operated doors are also recommended for use in shafts equipped with push-button operated elevators, dispensing with the service of elevator operators.

Operation and Details—These doors are operated by a specially designed motor, located in the elevator penthouse. Two lines of steel tape passing through tape guide made of heavy steel casting attached to the trucking sill of each door, with stop-balls and heavy cushion springs, are fastened to the driving mechanism located in the penthouse. Each door is equipped with side bar latches which engage the trucking bar when door is in a closed position. These latches are operated by cams located on the elevator car, and only those of door opposite stationary elevator are subject to release, insuring door against accident.



Operating Switch for Electrically Operated Door

Operating Buttons—The operating buttons may be located on any floor in the building or each floor if desired, also within the elevator car. Limit switches indicated on details control the vertical movement of these doors and the operation of the motor, automatically cutting motor electrical circuit when doors have reached the maximum opening and closing position.

When specified, the Peelle Motor Operated Doors can be made to open automatically in the self-leveling zone of the elevator.

Specification—Furnish, deliver and erect in complete working order, a Peelle power operator for each line of doors in the freight elevator shafts.

Each operating unit shall consist of a machine placed in the penthouse, with a motor, solenoid brake, worm and gear reduction, with sprocket chain drive. Cold rolled operating rods shall run the full length of the hatchway and shall pass through the hanger bar of each door. The rods shall be properly counterbalanced with a weight running in a steel frame to which interlocking system is attached. This equipment shall include the necessary automatic reversing controller, limit switches, automatic latches and cams for operating the doors.

A three button push button shall be placed in the car within easy reach of the operator.

The doors shall be opened by means of a momentary contact push button which shall be supplemented by a stop button so that the doors can be stopped by the momentary pressing of the button while the doors are opening. The doors shall be closed by means of a constant pressure push button which will automatically stop the doors when the button is released.

The installation shall be made by the door manufacturer and guaranteed by him for a period of two years against defects in workmanship or material. Any defective parts shall be replaced free of charge by the manufacturer.

Peelle Accessories for Automatic Push Button Controlled Elevators—Where automatic push button controlled elevators are installed, Peelle Doors are equipped with observation lights and special electrical contact bar lock which permits opening of the door only when car is at the floor level and prevents operation of the car when doors are in an open position.

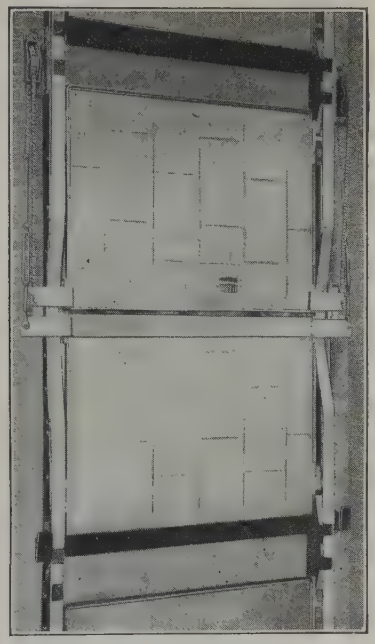
An Electrically Operated Peelle Counterbalanced Door Installation

This illustrates method of control by motor located in elevator penthouse

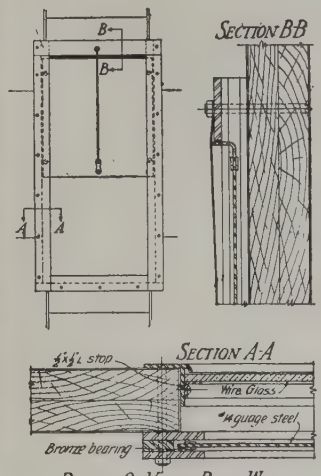
Continued on next page

Self-sealing Pass Type Counterbalanced Doors—Underwriters' Labeled

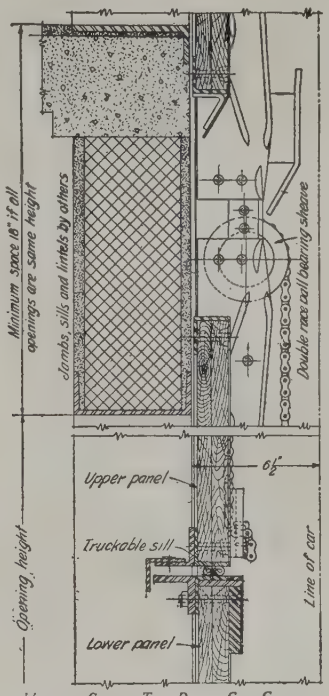
The Peelle Self-sealing Pass Type Door was the first counterbalanced door awarded the label and certificate of the Underwriters' Laboratories, Inc., for use where non-labeled pass type doors were previously used. These doors should be specified where story heights are not sufficient to permit the installation of the Regular Underwriters' Labeled Peelle Doors.



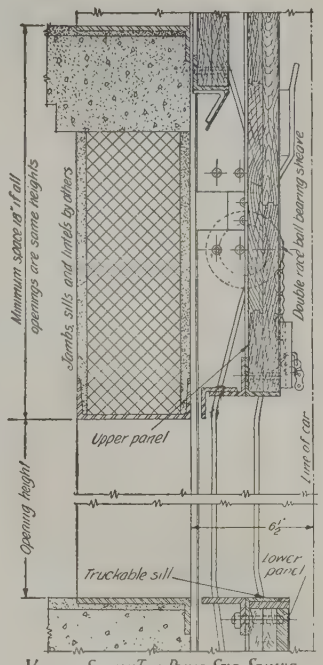
Shaft Side View of Self-sealing Pass Type Door



Details Of Vision Panel With Fuse Linked Shutter



Vertical Section Thru Peelle Self Sealing Door, Showing Door In Closed Position



Vertical Section Thru Peelle Self Sealing Door, Showing Door In Open Position

Note: Minimum return from face of jamb to sidewall of shaft is 8 in.

Analysis of Operation—It is the only door for a pass type condition, which, when in a closed position, allows both halves of the door to rest one directly above the other flush against the door frame. These doors, it will be noted, operate in one horizontal and two vertical planes. Both sections of door move vertically, on a specially designed patented rail away from shaft wall, until the guide shoes engage in the second vertical rail, then continuing in a true vertical position, passing the doors at the floors above and below. They possess all of the features of regular Peelle Counterbalanced Doors.

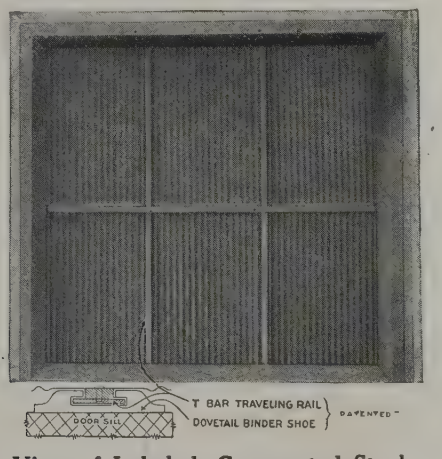
Self-sealing and Smokeproof—When Peelle Self-sealing doors are in a closed position, the angle door frames come into true contact with the iron door jamb (providing jamb is flush and plumb), completely sealing the opening against passage of smoke. This type of Peelle Door has demonstrated its value and efficiency in a great many buildings where high door requirements, heavy service and the advantages of the Underwriters' label make it particularly desirable. It is recommended that Self-sealing doors be equipped with the Peelle electric inter-locking system. Semi-automatic operation and kalamein panels are not advised.

Underwriters' Labeled Vision Panel with Fuse Linked Shutter—The Underwriters' label Peelle Doors equipped with wire glass vision panel. A fuse linked closing steel fire retarding shutter is placed on the shaft side of door as shown, a further protection against fire.

Corrugated Steel Counterbalanced Doors—Underwriters' Labeled

Peelle Corrugated Steel Freight Elevator Doors are used where medium weight doors are desired and where doors are not subject to very heavy service. Securely constructed and reinforced, they will render excellent service under ordinary use. These doors are labeled by the National Board of Fire Underwriters and the Factory Mutual Companies within the size limit of 8 ft. in width and 10 ft. in height. See above for shaft construction data.

Construction Data—Peelle Corrugated Steel Freight Elevator Doors are constructed under the direct supervision of the Underwriters' Laboratories, Inc.



View of Labeled, Corrugated Steel Counterbalanced Door from Loft Side

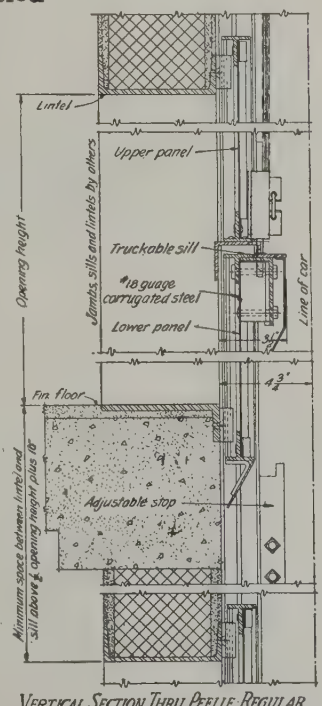
Built of heavy 18 gauge corrugated steel, framed with heavy T-iron structural sections, reinforced at the corners and braced at each side, these doors are furnished with Peelle patented T-bar traveling rail and dovetail binder shoe.

Large, patented, anti-friction shoes and large double radial ball bearing sheaves facilitate easy operation.

Peelle steel chains and heavy turnbuckle rods are fastened to each half of the door by means of a patented safety fastening, thereby insuring continuous and uninterrupted operation.

A positive action latch is standard equipment, operating at the center of the door, designed so that a slight pressure will release the doors and exert the greatest upward leverage.

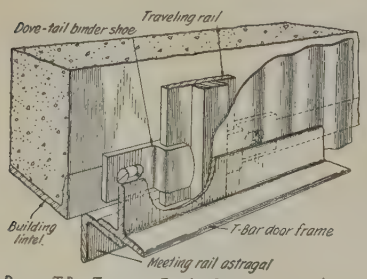
The T-Bar Traveling Rail—The patented T-bar traveling rail and dovetailed binder shoe are used only in the construction of Underwriters' Labeled corru-



Vertical Section Thru Peelle Regular (Underwriters'-labelled) Corrugated Steel Door

Note: Minimum return from face of jamb to sidewall of shaft is 7 in.

Continued on next page



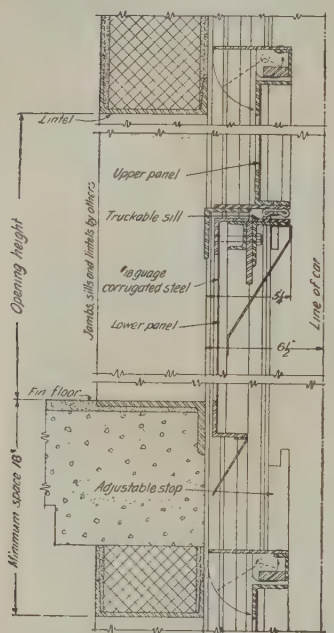
PATENT T-BAR TRAVELING RAIL AND DOVETAIL BINDER SHOE. SECTION THRU LINTEL SHOWING LOWER PART OF UPPER PANEL WITH CORRUGATIONS CUT AWAY

gated Steel Counterbalanced and Tel-co Doors. If specified, non-labeled doors may also be equipped with this device. The T-bar travelling rail and dovetail shoe tie both panels of the door securely to the sill and lintel. Doors in any position are held close to the wall. A steel facia 2 in. or more in width at lintel and sill is required for attachment of these shoes.

Peelle Corrugated Steel Pass Type Counterbalanced Doors—Underwriters' Labeled

This style of Pass Type door fills the need for a counterbalanced steel door, but is only recommended where trucking is not very heavy. Its construction is similar to the regular corrugated steel doors, except that it has the Pass Type door features, including the movable lintel.

Method of Operation—The panels are not mounted one directly above the other, but are staggered and run on separate guides. The upper panel is thus enabled to pass by the lower panel of the door on the floor above, the lower panel likewise lapping the upper panel of the door on floor below. (See vertical section.) The gap formed at the lintel is effectually closed by a movable gravity operated steel lintel.



VERTICAL SECTION THRU PEELLE CORRUGATED STEEL PASS TYPE DOOR

Construction—All regular Peelle features, the reinforced trucking sill, large patented anti-friction shoes, heavy angle steel guide rails, Peelle steel chains, double radial ball bearing sheaves and adjustable turnbuckle rods are part of the Peelle Pass Type counterbalanced door.

A positive action latch, operating at the center of the door, is designed so that a slight pressure will release the door and exert the greatest upward leverage. All fastenings are hand riveted.

Corrugated steel panels are not recommended for large sized openings; the wood metal-covered panels are more substantial.

Peelle Electric Inter-locking Systems

The Peele Electric Inter-locking System is applicable to any type door and all electrically operated elevators. It prevents the operation of elevator car until all doors in the shaft are closed. Approved by all departments having jurisdiction, it is an important factor in securing the lowest rate of casualty insurance. With magnetically controlled elevators the type B switches are wired in series with the elevator operating circuit. The opening of any door breaks the circuit and the car can be started again only when all doors are closed.

An emergency switch is furnished if required. Installed in the elevator car it permits operation of the car with doors open, in case of fire or accident.

Outline Specifications for Counterbalanced Doors

(Outline specifications for use where detailed standard specifications are not desired.)

To all openings in freight elevator shafts, except as otherwise noted, furnish and install in complete working order, Peelle Counterbalanced Truckable Doors, manufactured by THE PEELLE COMPANY, Brooklyn, N. Y.

All doors will be of [metal clad construction] [kalamein construction, type .....].

These doors [will] [will not] bear the Underwriters' label.

Peelle Electric Inter-locks and Emergency Switch in the elevator car, will be furnished. Elevator will be [car switch controlled type] [double button type] [automatic push button type].

Physical connection of the inter-locking system wires to the elevator control board will be made by the elevator contractor. Door contractor is to have the free and continuous use of the running elevator car for the installation of his work. This contractor is to guarantee for two years, workmanship and material.

Standard Specifications for Counterbalanced Doors

To all openings in the freight elevator shafts, except as otherwise noted, furnish and install in complete working order Peelle Patented Counterbalanced Truckable Doors, as manufactured by THE PEELLE COMPANY, Brooklyn, N. Y.

(1) The hanger bar at the upper surface of the lower panel is to be reinforced and extended beyond the panel frame, to rest on solid adjustable stops riveted to the guide rails so that all weight is removed from the turnbuckles and chains when the door is opened, and to permit of continuous trucking upon the smooth sill thus formed. The door shall sustain a maximum load of .... pounds.

(2) (a) These doors are to be made of two thicknesses white pine covered with 24 gauge stretcher leveled galvanized steel sheets set and bolted into angle iron frames with reinforced corners, hung on ⅝-in. turnbuckle rods and special Peelle steel cable chain running over 4½-in. double race ball bearing pulleys, and operating on the inside of the hatch in anti-friction shoes working in substantial steel guides, or (b) These doors are to be made of two thicknesses of white pine covered with smooth kalamein iron tightly drawn, set and bolted into angle iron frames with reinforced corners, hung from ⅝-in. turnbuckle rods, and special Peelle steel chain running over 4½-in. double race ball bearing pulleys, and operating on the inside of the hatch on anti-friction shoes working in substantial steel guides. Each door is to be paneled as shown in Peelle Co. catalogue over Key number ..... Provision to be made for glazing as per detail.

(3) The door on the ....floor is to be arranged with a lock and key to enable it to be opened from the floor side; all other doors shall open from the shaft side only.

(4) All doors to be constructed and erected in accordance with the rules and regulations of the National Board of Fire Underwriters, the Factory Mutual Companies and all local boards having jurisdiction where conditions so permit.

(5) All doors are to be guaranteed by the sub-contractor against defects in workmanship and material for a period of two years from date of installation.

(6) (a) These doors are to be manual opening and closing, or (b) These doors are to be manually operated and equipped with electric interlocking devices manufactured by THE PEELLE COMPANY which shall prevent the elevator car from leaving the floor until all doors are first closed and locked. (If elevator is to be controlled by a pull-rope add the following sentence: Install in complete working order one Peelle Clutch in each elevator shaft, which is to grip the shipper cable when any door is opened.) Include emergency switch in elevator car. Physical connection of wires to elevator control board to be made by elevator contractor.

(c) These doors are to be arranged to operate manually in conjunction with double button, (automatic push button elevator). This contract is to include necessary observation lights in each door and electro mechanical interlocks so door may be operated only when car is at floor level. Cam for operation of electro mechanical interlock will be furnished and installed by THE PEELLE COMPANY.

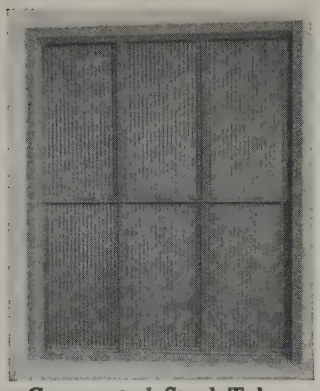
(7) These doors are to be electrically operated by means of the Peelle Door Motor located in the elevator penthouse and push button switch installed in elevator car.

(8) Door contractor is to have the free and continuous use of the running elevator car for installation of his material.

(9) Web strap closers shall be supplied on all manually operated doors exceeding 6 ft. 6 in. in height.

Continued on next page

Peelle Corrugated Steel Tel-co Doors—Underwriters' Labeled



Corrugated Steel Tel-co Door

While there are many types of paneling in which Peelle Tel-co Doors may be had, for installation in freight elevator shafts, the corrugated steel type, Underwriters' labeled, is recommended to withstand average use. All corrugated doors of this type are reinforced with the patented T-bar traveling rail and dovetail binder shoes, one or more to the door, according to size. See preceding page for detail of T-bar traveling rail and dovetail binder shoes.

Construction—Labeled by the Underwriters' Laboratories, Inc., and the Factory Mutual Companies and acceptable to all State and labor departments, this door has been rendering long and uninterrupted service. The 18 gauge corrugated steel panels are framed with heavy T-iron which is further strengthened with vertical iron members at each side. Tel-co doors are operated over extra heavy steel rails in patented anti-friction steel shoes and counterweighted very evenly. Counterweight and enclosure of heavy steel is furnished with all doors. The bar-latch used on all Peelle Tel-co Doors is arranged to engage the rails at each jamb, thereby insuring perfect protection against illegal entry to the building when doors are installed at exterior entrance to elevator shafts, and for safety when doors are installed at interior elevator entrances.

Double Sprocketed Tel-co Sheaves

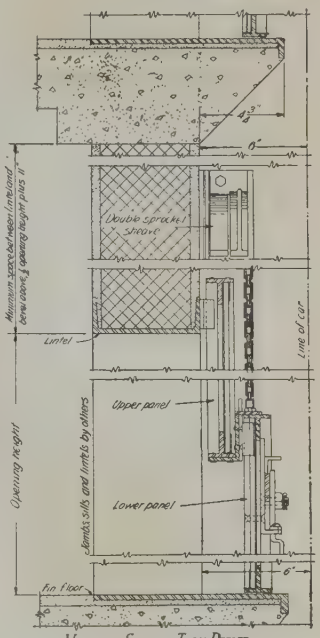
Clearances—If other than the corrugated steel panels are desired, please consult the Engineering Department before establishing jambs or headroom clearances.

It is necessary to allow clear travel space above the lintel of half the door height opening, plus 11 in. These figures apply only to doors whose width does not exceed the height, and where over-all sizes are not greater than 8 ft. in width and 8 ft. in height.

Double Sprocketed Tel-co Sheaves (Patented)—Illustration shows the ball bearing double-sprocketed sheave of heavy malleable iron in one piece. (Designed and patented by The Peelle Company.) The chain fastened to the lower panel is engaged by the large sprocket and connected to the counterweights on the other side of the rail.

The chain of the upper panel is run over the small sprocket and left to idle on the opposite side.

Lifting of the lower panel causes the large sprocket to revolve and the small sprocket which forms a part of the sheave also revolves, carrying with it the weight of the upper panel. The number of teeth in the gears are as two to one. Thus, both panels arrive at the lintel simultaneously.



Vertical Section Thru Peelle Medium Type Tel-Co Door

Note: Minimum return from face of jamb to sidewall of shaft is 8 in.

Outline Specifications—At openings (insert locations), furnish and install in complete working order, Peelle Standard Type Tel-co Doors manufactured by The Peelle Company, Brooklyn, N. Y.

These doors are to be constructed with [metal clad], [kalamein], [wood], [18 gauge corrugated steel] panels. Corrugated steel doors in elevator shafts only will bear the Underwriters' label.

Doors will be equipped with the Peelle Electric Interlocks and Emergency Switch in the elevator car. The elevator contractor will make the physical connection between interlocking system wires and the elevator control board.

All workmanship and materials will be guaranteed against defects for a period of two years.

Peelle Heavy Service Tel-co Doors

The heavy type Peelle Tel-co Door is recommended for use at driveway entrances, railroad sidings, entrances to buildings where provision is made for loading freight cars within the building, at piers and other conditions where door openings are unusually large, and quick and easy vertical operation is desired.

Both halves of the door travel upward simultaneously, the lower half moving twice as fast as the upper half, reaching the lintel of the opening together.

Each condition requires special engineering study. The doors operate manually, by means of a chain joist, winch hoist or motor.

For doors which will be constantly in use, the Peelle electric motor operation is recommended.

A switch, conveniently located, operates this type of door, permitting rapid handling of traffic.

In the installation of four Peelle Tel-co Doors in the Manhattan Storage and Warehouse Building Peelle engineers were called upon to assist in planning structural conditions necessitated by the problem of providing clearance for door operation upward, through and into the second floor to allow maximum headroom for entrance and exit on ground floor.

All four doors are operated from a central control point located conveniently over checking clerk's desk.

Construction Data—The doors are heavily constructed and will be furnished with wood or wood metal-covered panels, framed in heavy structural angle iron reinforced at the sides and operated in the Peelle patented anti-friction shoes over heavy steel guides.

Large sheaves, especially designed to increase the ease of operation, necessitates a clearance over the door opening lintel of one-half the height of the door plus 2 ft. 2 in.

Where the width of the door exceeds the height, additional return space at the jambs may be necessary for standard cast iron counterweights.

Products

Richmond Fireproof Door Co. has been engaged continuously for thirty-seven years in the manufacture, sale and erection of the following products:

Fire Doors: Tin clad, corrugated iron, kalamein and steel plate.

Counterbalanced Freight Elevator Doors: Tin clad, corrugated iron, kalamein, wood and steel plate.

Bi-folding, Single Slide-up, Telescoping, Turnover, Double and Single Swinging and Sliding Doors made of all the preceding materials for industrial purposes.

Storage Room Units.

Kalamein Frames, Trim, Casings, Mouldings and Smoke Screens.

Richmond Rolled Steel Combination Bucks and Trim.

Also Electric Interlocks.

All of the preceding products are labeled when permissible under the regulations of the Underwriters' Laboratories, Inc., Chicago.

This Company manufactures every type of Fire Retardant Door except hollow metal and rolling steel curtains.

Kalamein doors may be finished shop coat or durable baked enamel, plain color or wood grained. We use the term "kalamein" in its modern sense—metal covered. Our metal is patent leveled galvanized stock. Specify *galvanized* sheet—it lasts.

Fire Doors

The three illustrations show the swinging and sliding corrugated iron fire doors and storage room steel plate door, all being labeled by the Underwriters Laboratories, Inc.

The relative appearance of the doors is clearly shown. The corrugated iron doors may have wickets. The swinging type may be single or in pairs, to lap the openings or to close into wall frames, to suit all conditions and openings, and may be labeled for all situations similar to tin clad doors. They may have glass panels for Class C and D openings.

The steel plate doors are labeled for storage room openings only.

Write for catalogue—it contains a full description of the various types with useful information regarding layout and clearances.

Elevator and Dumbwaiter Doors

Counterbalanced elevator doors are now universally preferred for freight elevator shafts because they are installed entirely on the inside of the shaft and do not encroach either on floor space or car platform. They provide maximum clear opening.

The door is divided into two equal sections, one half sliding up and the other half sliding down. The guides are bolted to the wall or opening frame.

Vertical telescoping doors are similar in design except that both halves slide upwards, the lower section traveling twice as fast as the upper.

For these types, regular installation requires a distance from floor to floor of one and one-half times the opening height, plus 9 in. for counterbalanced, and 24 in. for vertical telescoping doors, respectively. For limited floor heights the counterbalanced door may be furnished in pass type construction.

Corrugated iron vertical telescoping and counterbalanced doors of the tin clad, kalamein or corrugated iron construction may be labeled by the Underwriters. Both types may also be made of wood for exterior openings or shipping platforms, but are not labeled.

Operation may be manual, semi-automatic closing or electric interlocking.

Vertical telescoping doors are especially adapted to use for shipping platforms or garage and similar openings.

Both types require approximately 8 in. side room each side, but the telescoping door, being counterweighted, needs in addition space at both sides for 8x8-in. weight box.

Richmond counterbalanced doors are furnished with roller or ball bearing sheaves as may be desired, vision panels of labeled construction, if specified, and all modern improvements.

The upper rail of the lower section of the door is so reinforced and constructed that when the door is open a "bridge" is formed between the car and the building sill and, like a bridge, the span is supported at each end by substantial parts of the door assembly. This "bridge" provides a smooth trucking surface over the door.

Richmond counterbalanced dumbwaiter doors, kalamein, tin clad or steel plate, are similar in design and operation, but adapted to dumbwaiter shaft use. They require only 3 in. at each side.

Our catalogue gives all details of construction including shaft space requirements. Let us place a copy in your files.

Industrial or Warehouse Doors

Richmond horizontal bi-folding doors are widely used for driveways and shipping platforms. Built in two sections, this door folds along horizontal meeting rails at the center, in jack-knife form, and rises upward, leaving a clear opening. The turnover door, made in one piece and adapted to the smaller size openings, operates in somewhat similar fashion, turning up inward overhead. For the two types, a space of 6 in. is required inside of one jamb and 16 in. inside the other jamb, with clear headroom varying according to weight and size of door. While the latter may be as little as 12 to 15 in., the efficient operating minimum is 24 in.

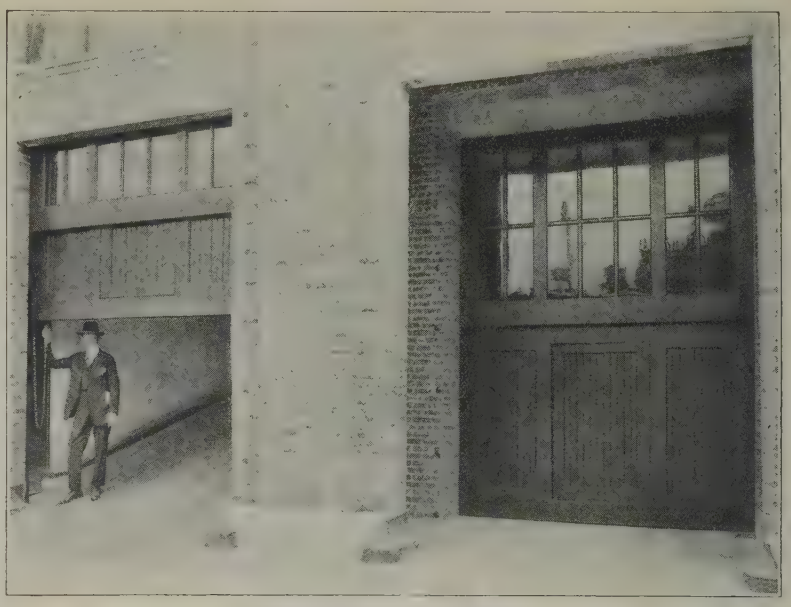
The telescoping or two-piece slide-up door, also in wide use for driveway and shipping platform openings, was described in connection with counterbalanced doors on the preceding page.

All types of doors may be had in wood, kalamein, tin clad, corrugated iron or steel plate, and all may be paneled for glass to permit the access of light, irrespective of material. In addition, we manufacture single and double swinging, sliding, side-folding and single-piece slide-up doors, for industrial purposes, of all the materials mentioned.

Hardware for all these doors, as well as that for fire doors and counterbalanced doors, is manufactured by us in our own factory, being of exceptionally sturdy and attractive design.

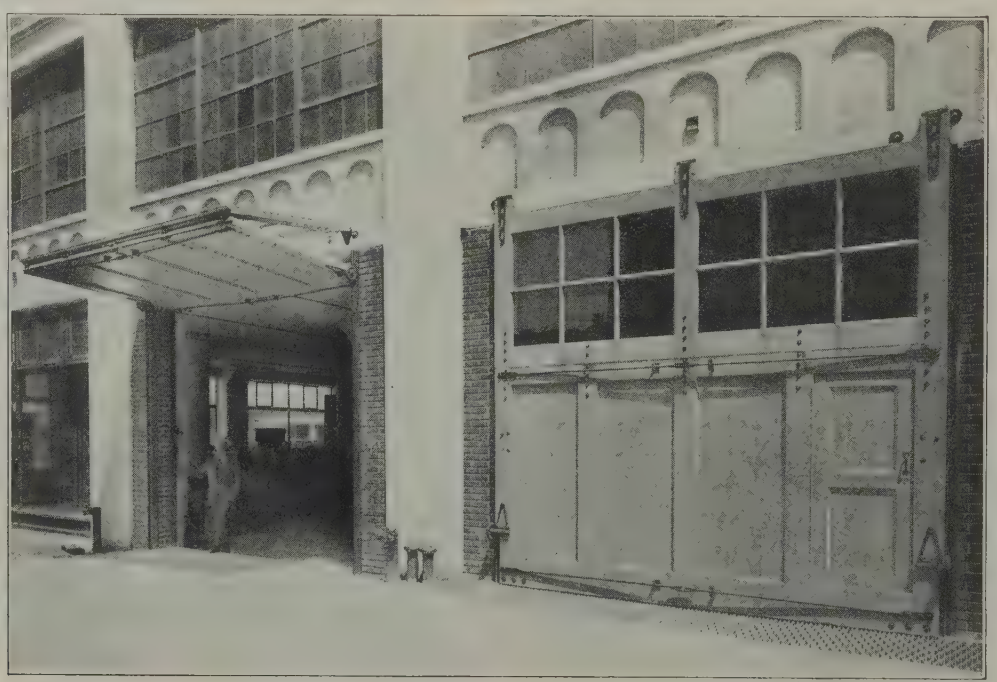
Industrial doors are described, together with suggestions as to the appropriate use of the different types, in a special pamphlet which we will be pleased to mail you.

The new Richmond patented *fire-panic* type handles for application to regular triple latches operate with direct, easy, horizontal push and pull, speeding up use of openings in congested factories. Sure locking and easy opening, they are a truly modern type of fire-door hardware operating handles. Specify them exclusively.



Wood Telescoping Doors

Wood Turnover Door



Kalamein Bi-folding Door (Outside Construction)

Kalamein Doors

Richmond kalamein doors are covered with No. 26 and No. 24 gauge galvanized patent leveled special door stock—the highest grade material in use in the trade. All work is die drawn in accordance with the usual architectural specifications. Grades heavier than No. 24 gauge are practically always brake formed.

All wood used is thoroughly dried in our own kilns.

We have dies for an unusually large variety of casings and mouldings. Kalamein frames and trim, or combination pressed steel bucks, can be provided with doors. Doors are available with a wide range of panel arrangement and may be labeled within limitations set by the Underwriters.

Our Catalogue contains illustrations of paneling types, moulding shapes, standard specifications, details of construction and other valuable information.

Richmond kalamein frames are formed upon cores rabbetted from one solid piece of wood, and casings, mouldings, etc., are of solid wood lengths up to standard sizes. No piecing or patching is permitted.

For elevator enclosures, our doors are specially reinforced at the head to receive hardware when appropriate.

Durable baked enamel, plain color or wood grained, is applied in our own ovens, when desired.

Particular attention is drawn to the Richmond special labeled kalamein door, which is manufactured with a steel edge underneath metal covering and a fireproof metal lock box. This door is furnished only when definitely specified.

Richmond Fireproof Door Co. is prepared to furnish when desired, special Underwriters' labeled finished hardware completely installed in doors.

Kalamein Faced Counterbalanced Door

Kalamein Door and Partition

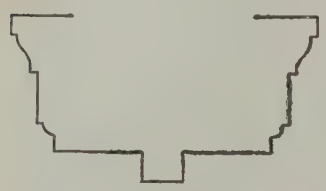
Richmond Rolled Steel Combination Bucks and Trim

Richmond rolled steel combination bucks and trim are distinguished by a new beauty and sharpness of line, made possible through the use of rolled steel from our recently installed, specially designed machinery. They can be furnished in handsome imitation natural wood baked enamel finishes, either oak, walnut or mahogany.

The three standard types—A, B and C—as shown by detail drawings on the following page, provide for most interior door openings. Combinations of Types B and C frames are readily utilized for sliding elevator door openings.

Richmond rolled steel combination bucks and trim are easily and neatly prepared at the factory to accommodate transoms; side or borrowed light frames, attached to the Richmond rolled steel combination bucks and trim, can be furnished when desired.

An angle iron strip may be attached across the bottoms of frames to keep the frames from spreading or buckling. These spreader stays save installing time, for the frames are held firmly, square and plumb, requiring little or no leveling after setting up. Doors are more easily hung and fit more perfectly on frames thus set.



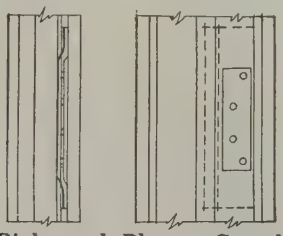
Note the Clean Sharp Lines

Underwriters' label service may be furnished on frames for openings up to 3x7 ft. in size.

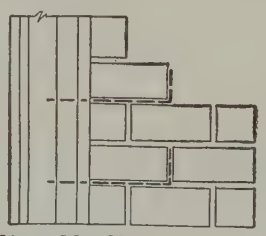
Richmond Construction Features—At all hinge and striker plate locations steel reinforcements are spot-welded to the inner surfaces of the jambs. Holes are accurately drilled with templates through these reinforcing plates at the factory, providing for the rapid attachment of the hardware.

Plaster guards of No. 26 gauge galvanized steel are welded inside of the reinforcing plates to protect the screwholes from mortar and plaster. This saves time in the attachment of the hardware.

Adjustable T-shaped sliding anchors, made of No. 16 gauge stock, are furnished with Richmond rolled steel combination bucks and trim. These anchors can be set wherever desired between courses of a masonry wall as the wall is built. The anchors require no adaptation of plan, yet bond the frames solidly to the finished wall.



Richmond Plaster Guards



Adjustable Sliding Anchors

Richmond Service—When your plans call for special frames you are invited to consult our engineers; they will be glad to co-operate in working out the designs for special frames or shapes. Our years of experience in this special field may be of value to you.

With the recent installation of the very latest type of rolling machinery we are now equipped to handle large contracts very efficiently.

We also maintain facilities for erecting Richmond rolled steel combination bucks and trim on any job where desired.

The branch offices and agents, with sales, erection and other service facilities, which we maintain in 50 principal cities throughout the United States, will be pleased to co-operate with you in every way; they have samples of Richmond rolled steel combination bucks and trim ready for your inspection.

Specifications for Rolled Steel Combination Bucks and Trim

The contractor shall furnish and install Richmond Rolled Steel Combination Bucks and Trim, as manufactured by the Richmond Fireproof Door Co., of Richmond, Ind., for all interior door openings (excepting those door openings otherwise noted on drawings or specifically mentioned hereinafter).

Note: The types of Richmond rolled steel combination bucks and trim are designated on the drawings by the symbols A, B and C, corresponding to similar symbols used by the manufacturer to identify the three basic types of frames.

Types and Sizes—***Openings Trimmed Both Sides***—For openings which are to be trimmed on both sides, Type A frames shall be used in 4½, 5½, 6½, 7½ and 8½-in. widths for 3, 4, 5, 6, 7, and 8-in. partitions, respectively. The plaster returns shall be of proper dimensions to meet the particular building conditions. The rebates shall be of uniform width for all frames but with variations, as required, in the widths of the rebate stops.

Openings Trimmed One Side, No Rebates—For openings which are to be trimmed on one side only, and for which no rebates are necessary, Type B frames shall be used in 3½, 4¾, 5¾ and 6¾-in. widths, as the respective openings may require. The plaster returns shall be of proper dimensions to meet the particular building conditions.

Openings Trimmed One Side, with Rebates—For openings which are to be trimmed on one side only, and for which rebates are necessary, Type C frames shall be used in 6¾, 7¾, 8¾, 9¾ and 10¾-in. widths, as the respective openings may require. The plaster returns shall be of proper dimensions to meet the particular building conditions.

Elevator Door Openings, etc.—For sliding door elevator openings, and elsewhere as noted on drawings, combinations of Types B and C frames shall be installed in widths to properly meet the requirements of the respective openings.

Construction—***Material***—All frames shall be made of No. 16 gauge cold rolled steel, with all angles, moulds, returns and miters neatly made and maintained in true alignment.

Reinforcing for Hardware—At the hinge and ock locations ⅛x1¾x12-in. reinforcing plates shall be spot-welded to the inner surfaces of the jambs; No. 26 gauge galvanized plaster guards shall be welded to the jambs in such manner as to prevent mortar and plaster from contact with the reinforcing plates, and to keep the screwholes free and clean for hinge and strike plate connections. The holes shall be drilled and tapped at the factory, making the frames ready for the attachment of the finish hardware.

Note: Templates for this purpose to be furnished to this contractor by the hardware contractor promptly upon request.

Slip Anchors and Sill Clips—Sufficient slip anchors shall be provided with each frame to permit anchoring each jamb (including head if desired) at intervals not to exceed 2 ft. The base of each jamb

Continued on next page

shall be provided with a sill clip, welded to the jamb and punched with two 3/8-in. holes to facilitate anchoring to the floor construction. The form and construction of these anchors and sill clips shall be as shown and described by the manufacturer for the respective types of frames included in this specification.

Painting—All concealed and exposed surfaces of frames shall be given a good prime coat of rust-resisting paint at the factory prior to shipment.

Trim and jamb surfaces which are to remain permanently exposed shall have applied at the factory [oak] [walnut] [mahogany] imitation natural wood baked enamel finish.

Erection—All frames shall be set in their proper places in the building prior to the erection of the adjacent partition work; frames shall be securely anchored to the floor construction by means of screws or expansion bolts through the sill clips, as the nature of the floor construction may require. Each frame shall be set true and plumb and shall be securely braced and so maintained by this contractor during building operations. The slip anchors shall be inserted in the frames at proper intervals and built into the adjacent partition work during construction. At completion each frame shall be plumb, in true alignment, clean and rigid, ready for the attachment of hardware.

Products

"Sec-Tel" Corrugated, Metal Clad and Kalamein Two-section Slide-up Freight Elevator Door.

"Seco" Corrugated, Metal Clad and Kalamein Counterbalanced Freight Elevator Door.

"Horifold" Warehouse, Freight House Shipping Platform and Garage Door.

"Vertel" Corrugated Warehouse, Freight House and Shipping Platform Two-Section Slide-up Door.

"Seco" Door Electric Interlocks.

Also Dumbwaiter Doors for department stores, hotels, hospitals, restaurants and factories.

Underwriters' Approval

All "Sec-Tel" and "Seco" freight elevator doors are inspected and labeled by the Underwriters' Laboratories, Inc., and the Factory Mutuals, when so desired, provided they are within the size limits that permit labeling: viz., 8x10 ft.

The services of our Engineering Department, as well as those of our representatives in all the leading cities of the United States are at your disposal in solving door problems.

Write for Catalogue "C" covering our "Horifold" and "Vertel" doors, or for Catalogue "D2," giving complete information about our "Sec-Tel," "Seco" and dumbwaiter doors.

"Seco" Counterbalanced Freight Elevator Doors

"Seco" doors are of the *truckable* counterbalanced type, being made in two sections, which slide in opposite directions on the shaft face of the wall. The sections are of equal weight, evenly counterbalancing each other, eliminating all counterweights.

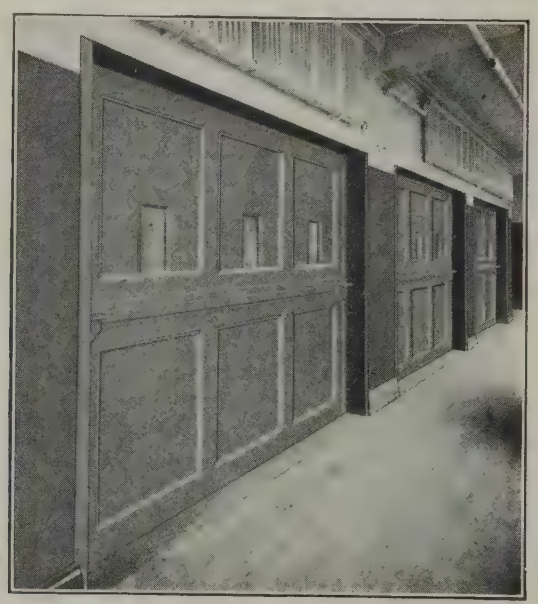
"Seco" doors can be furnished with metal clad, kalamein or corrugated steel panels.

"Seco" doors are provided with heavy steel angle or *tee trucking bars*. The *trucking bars* form the top edge of the lower section and are supported in *perfect alignment* with the opening or floor sill when the door is in the open position by means of heavy *angle trucking bar supports* at each end of the trucking bar.

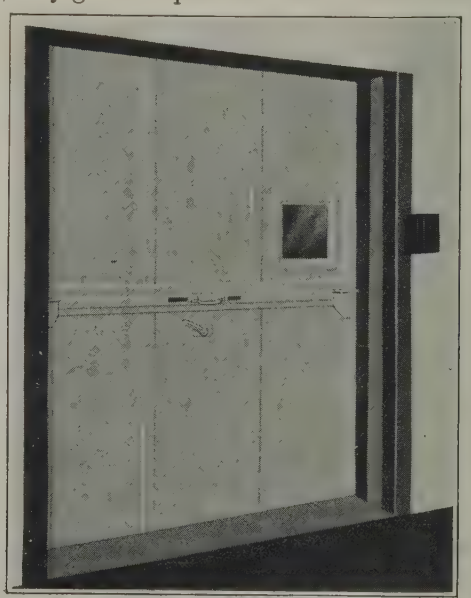
These sill or trucking bar supports rest on the solid opening sill, require no adjustment, and always remain in the same permanent position. The supports are designed to act as gusset plates in the upper corners of the lower section, reinforcing it and securely joining the section frame to the trucking bar.

"Seco" doors are hung with heavy adjustable chain rods and cable chain operating over large double race ball bearing sheaves.

No safety gates required when "Seco" doors are used.

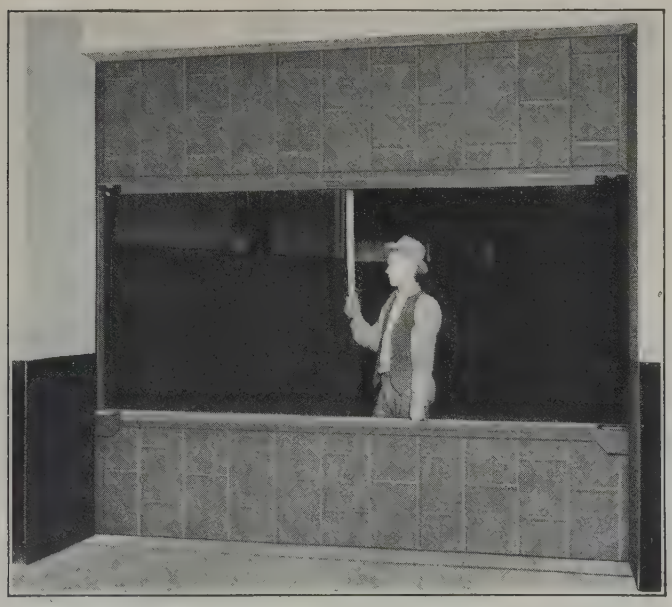


Kalamein "Seco" Door Installation



Room Side of Type M-6 "Seco" Door
Arranged for room side operation in connection with double button elevator

Continued on next page



Large Metal Clad "Seco" Door—Partly Open

"Seco" Door Construction

Metal Clad Panels—These doors are constructed of two thicknesses of white pine, and covered on both sides with fire door terne plate or flat galvanized sheets, and securely bolted into heavy angle frames.

Kalamein Panels—These doors are constructed of white pine cores, paneled on the room side, flush on the shaft side. Room side of panels is covered with smooth kalamein iron, glued to the core, and has drawn steel mouldings around panels fastened in place so that no nail or screw heads show.

The shaft side of doors is covered with flat galvanized steel sheets. All seams between stiles and rails are clipped, filled with solder and ground smooth.

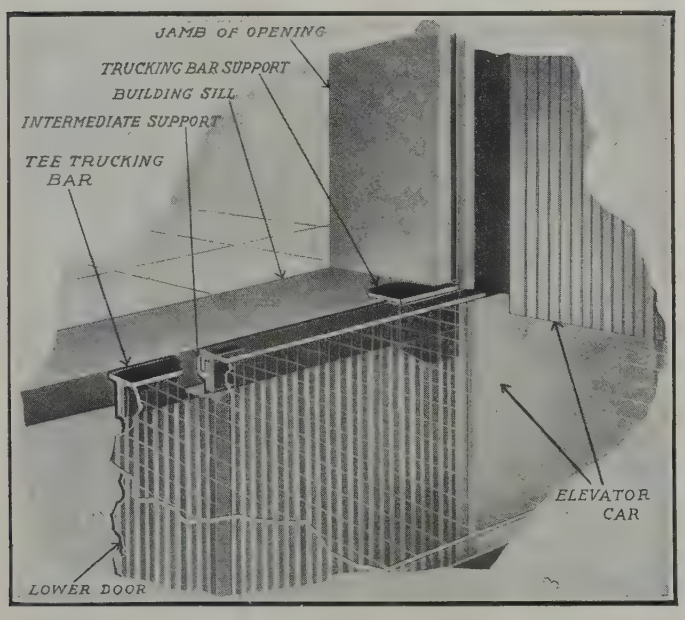
Corrugated Steel Panels—These doors are made of corrugated steel sheets riveted into angle frames forming door sections, and are stiffened vertically with flat steel reinforcing bars.

Adjustable Shoes (Patented)—"Seco" Doors are equipped with patented adjustable shoes. These eliminate friction and permit adjustment to reduce side play between the doors and guides caused by wear and spreading of guides.

Space Requirements—Schedule below should be consulted in order to determine highest opening obtainable in certain story heights for Regular and Pass Type "Seco" doors.

Also note other space requirements to insure a perfect installation.

When story heights are such that Regular Type "Seco" doors can not be used for opening heights desired, Pass Type "Seco" doors should be used.



"Seco" Door with Self-Aligning Trucking Bar Support
Note that trucking load is supported by opening sill
Angle trucking bars are used on metal clad doors

SCHEDULE OF MAXIMUM OPENING HEIGHTS "SECO" DOORS
For Various Floor Heights

Opening height "B" ft.	Opening height "B" in.	Minimum "C" for regular type ft.	Minimum "C" for regular type in.	Minimum "C" for pass type ft.	Minimum "C" for pass type in.

Section Through Opening Showing Regular Type "Seco" Door

"Seco" Door Interlocks (Patented)

"Seco" Doors when equipped with Security Patented Electric Interlocks provide maximum protection against fire and accident.

Security Electric Interlocks are especially designed for vertically sliding doors and have been approved by the Underwriters and various State and municipal departments, assuring low casualty insurance rates.

Security Electric Interlocks are used with electric elevators, are attached to each door and are connected in series to the elevator control board, so that the elevator can not be operated until all doors in the shaft are closed and contact is made in the door interlocks.

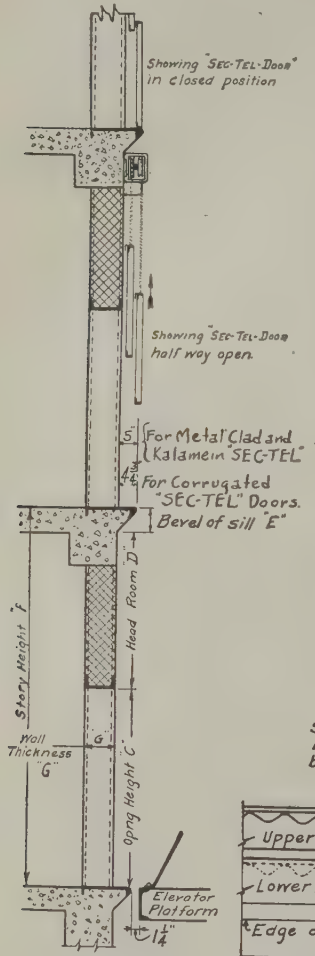
Specify Type "C" or Type "D" Interlocks for car switch controlled elevators, Type "DL" Interlocks for "push button" or "double button" operated elevators.

Send for a copy of Catalogue "D2."

Continued on next page

"Sec-Tel" Door

The "Sec-Tel" door is a two-section slide-up or vertical telescoping elevator door with corrugated steel, metal clad or kalamein panels. It permits the use of the permanent building sill for trucking over on to the elevator car. It operates in double guides, the lower half traveling twice as fast as the upper, so that as the lower section is raised, both sections are simultaneously set in motion and reach the lintel of the opening at the same time, giving a perfectly clear opening. The use of double race ball bearing sheaves and antifriction door guides assures ease of operation.



Section Through Opening Showing "Sec-Tel" Door Space Requirements

SCHEDULE OF OPENING HEIGHTS "SEC-TEL" DOORS

For Various Floor Heights Allowing 4 in. for Bevel "E" of Sill

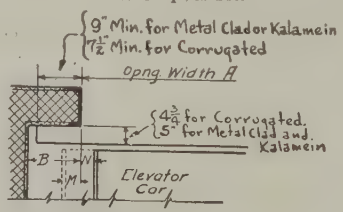
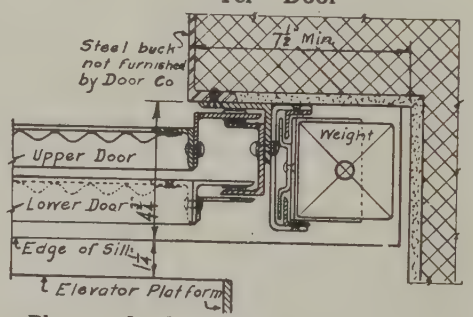
9	6	5	2	15	0
10	0	5	5	15	9

Note: Space "D" for metal clad or kalamein "Sec-Tel" doors should be increased 6 in. if possible.



Plan of Shaft at Jamb—"Sec-Tel" Door



Plan at Jamb—Corrugated "Sec-Tel" Door

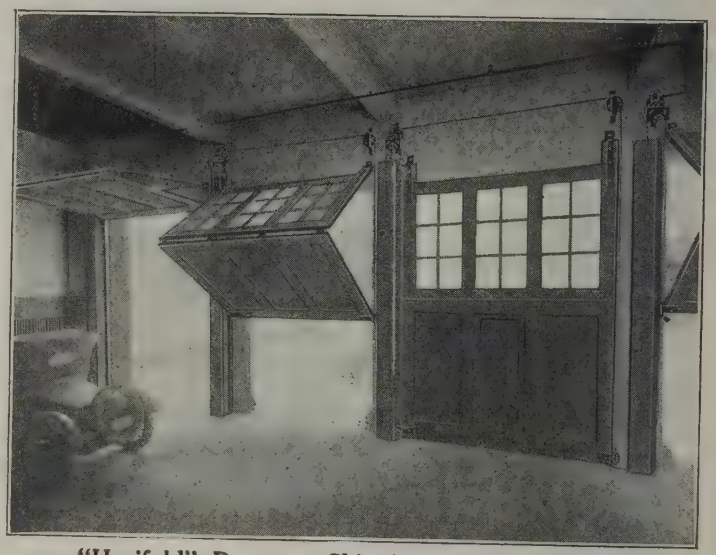
Kalamein and metal clad doors require 9-in. space at sides and 5-in. projecting sills

Corrugated "Sec-Tel" Door

"Horifold" Door

The "Horifold" door is a horizontal folding-up door, and can be made of wood, corrugated steel, tin clad or paneled wood metal covered sections. "Horifold" doors are suited for shipping platforms of warehouses, factory buildings, freight houses and garages.

"Horifold" doors are of rigid construction, operate with ease, and are unexcelled for withstanding severe weather conditions.



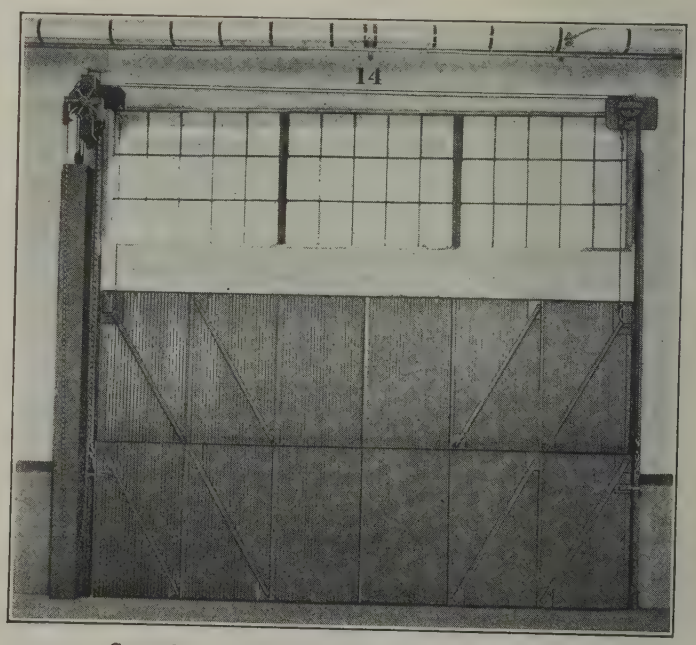
"Horifold" Doors to Shipping or Garage Space

"Vertel" Door

"Vertel" doors are made of corrugated steel sheets riveted into angle frames. They can be arranged for glass in upper half to admit light, and with a wicket door in lower section.

"Vertel" doors are made in two sections, both of which travel upwards; the lower section traveling twice as fast as the upper section, reaching the lintel of the opening at the same time.

"Vertel" doors permit storage of material within a few inches of the door without affecting its operation.



Security "Vertel" Door (Interior View)

Used for shipping platform and freight house openings. Above door is used on opening 16x9 ft. showing both door sections solid

QUINCY ELEVATOR GATE COMPANY

Manufacturers of Power Operators for Elevator Doors and Gates

TIFFIN, OHIO

Products

FREIGHT ELEVATOR DOOR OPERATORS for opening and closing landing gates, counterbalanced doors, telescoping fire doors, steel rolling doors and riding car gates.

FREIGHT ELEVATOR GATES.

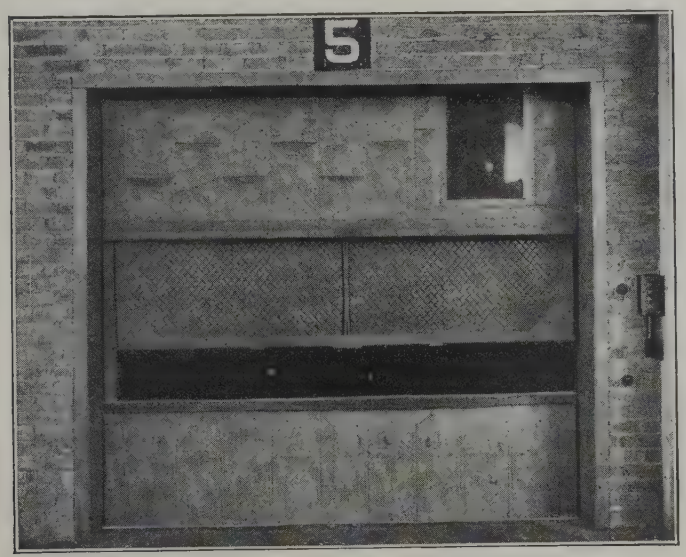
Also manufacturers of Operators for opening and closing garage doors and steel rolling entrance doors.

Recommendations

Recommendations on power operators cheerfully furnished for any project. With thirty years' experience as elevator gate and operator manufacturers, we are pioneers in this specialized line of activity.

Quincy Door Operator

The annunciator informs the elevator operator of the stop to be made. When reaching that floor he releases his elevator control switch handle and the doors open automatically. The operator can at all times instantly stop the doors while opening or closing by pressing "Stop" button.



Door Partially Opened (Riding Car Gate Is An Optional Feature)
Lift rods and operating device inside of hatch

In addition to automatic opening device, there is a three-button station on the car marked "Open," "Close" and "Stop" and a duplicate station in a locked box at outside of hatch wall at any one designated floor.

Quincy Friction Grip System for Power Operation of Counterbalanced Elevator Doors

The Quincy Friction Grip System has two 5/8-in. round rods (one on each end of the door) connected to cables which pass over drums in the penthouse. Doors remain evenly balanced. Any one or more doors can be quickly changed to manual operation, remaining doors can continue to be operated by electric machine.

Door Device and Lock—To each side of the top door section a friction block is attached by means of a 3/8x3½-in. flat bracket.

A friction block can only engage with the vertical rod when the car is at its landing; thus the vertical rods slip through the open friction blocks on the other doors.

The combination lock and interlock is mechanical in operation and positively prevents operation of the elevator when any door is opened or unlocked.

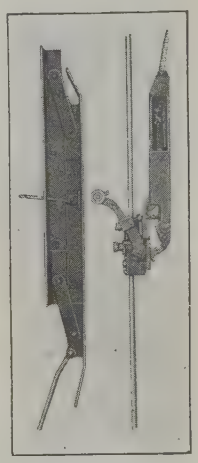


Fig. 4. Retiring Cam on Car; Friction Block on Door; Lock on Door Guide

CORNELL IMPROVED DEEP ARCH INTERLOCKING SLAT STEEL ROLLING SHUTTERS and DOORS, handle, chain, crank, or motor operated, for residences, office buildings, garages, wharves and piers, warehouses, elevator shafts, store fronts, craneway openings, etc.

UNDERWRITERS' LABELED FIRE DOORS and SHUTTERS.

Send for 32-page, 1928, Catalogue, with complete dimensions, specifications, etc.

Location

Cornell doors are manufactured in Greater New York in a modern one-story factory.

Unexampled shipping facilities by all railroads, as well as water routes to all points on the east, south and west coasts, and the Great Lakes.

Experience

CORNELL IRON WORKS, INC., is the oldest rolling door manufacturer in the United States. Cornell doors have been in use for over 50 years. Our later types embody many modern improvements.

CORNELL ROLLING DOORS

Description

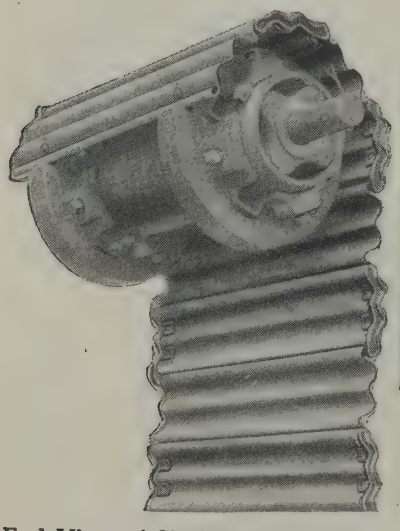
Cornell steel rolling doors are designed for the closure of all types of openings. They offer fire and burglar protection, combined with neat appearance and economy of space.

The curtains run in vertical side guides, and coil around a horizontal shaft above the opening.

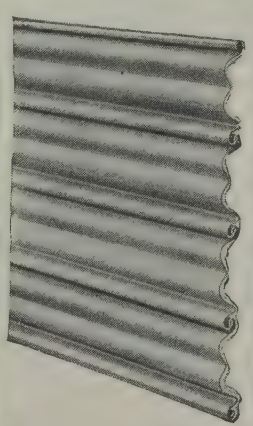
The weight of the curtain is counterbalanced by springs in the shaft, which permit it to remain stationary in any position.

Why Cornell Rolling Doors

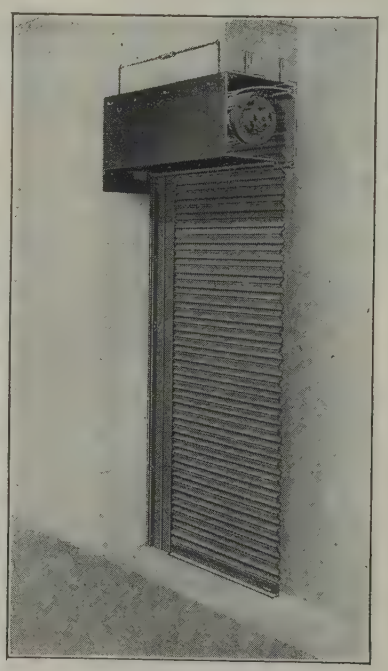
They take the minimum of room. They are all-steel and will last as long as the building. They operate with surprising ease in the largest sizes. They are easily repaired, after accident, with a few new slats quickly inserted.



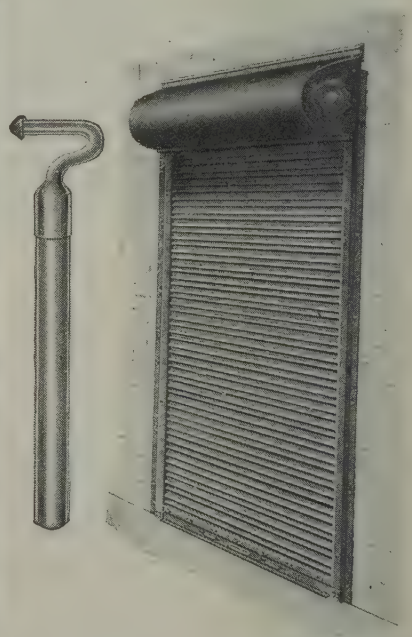
End View of Shaft and Curtain
Note malleable iron end locks and deep arch of slat



Front View of Slat Curtain
End locks removed



Sectional View of Llenroc Labeled Door, Between Jamb Location
Note the fuse link and the hinged baffle plate which drops on the curtain top in case of fire



Type SCF Door
Abbreviation for self-coiling operation, face of wall location. Standard up to 80 sq. ft. It can be operated from either side by handles. Pole furnished gratis where required

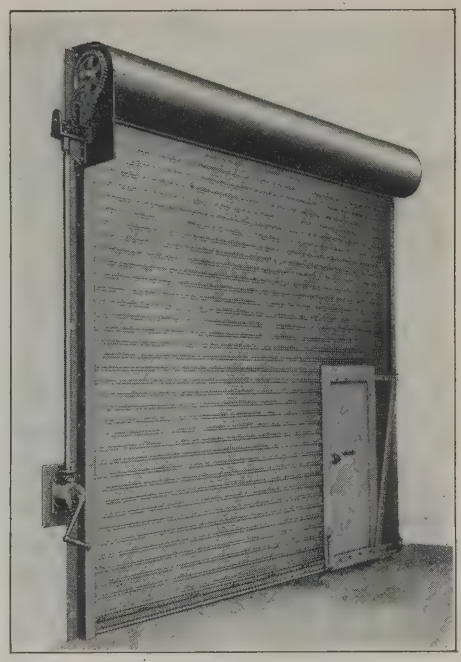
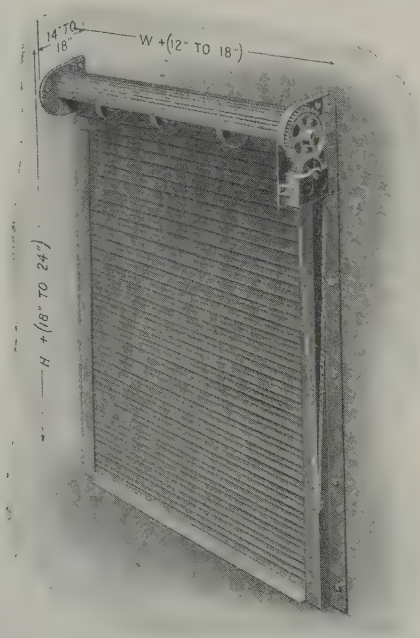
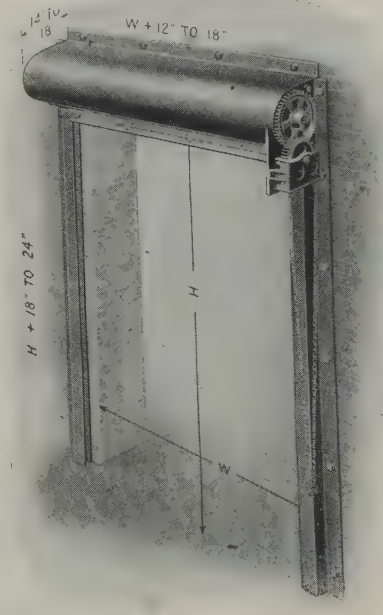
2nd Step
Steel brackets attached supporting the shaft. Note the self-contained construction, making for easy erection



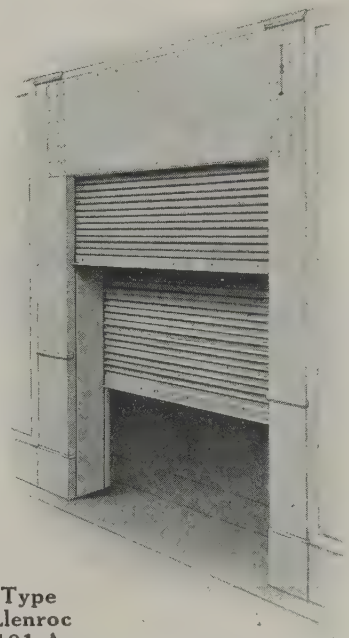
Type HCF Door
Abbreviation for hand crank operation, face of wall location. Easily operated from either side of wall. Note the small wicket, or pilot, door, the frame of which swings out when the big door has coiled



3rd Step
Steel curtain in place. Note the dimension limits giving approximate clearances required

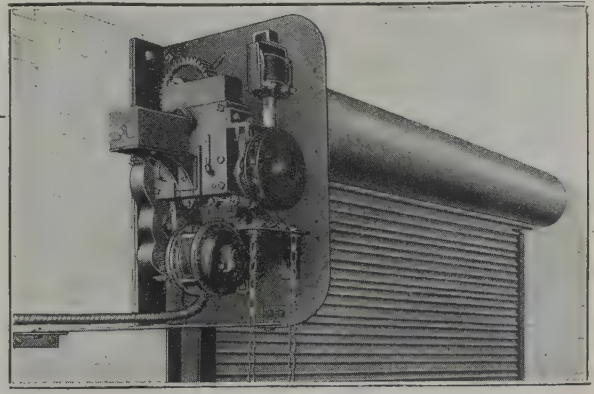


4th Step
Curtain rolled up with hood in place. The cylindrical hood is fastened to the wall with expansion nails. Note approximate clearances



Type Llenroc 101-A
Double and Superimposed
One door coils above the other thus economizing space. Makes a neatly concealed installation for fine buildings. Both doors labeled

Erection of a Cornell Chain Gear Face of Wall Door Type CGF
Four steps in the erection of a Cornell chain gear face of wall door. Abbreviation "CGF," specifying the type. The chain and gearing may be placed on the left side if preferred. The pipe shaft contains the counterbalancing springs. This is the standard door for openings over 80 sq. ft. up to the large motor driven installations



Type MX Door
Standard electric motor drive for smaller doors. Note the self-contained, direct connected construction, the enclosed gears, the limit switch, solenoid brake and emergency hand chain

Operation

There are four typical methods of operation:

Self-coiling Type—Standard for openings up to 80 sq. ft. and below 8 ft. in height. Push up and pull down by handles on the bottom bar. The quickest acting construction possible.

Hand Chain and Gearing Type—Standard for larger openings. Shaft revolved by endless hand chain, acting through single, or compound, gearing on an overhead gear bracket.

Motor Drive Type—Standard for the largest openings up to 45 ft. in width.

Continued on next page

Automatic Closing Type—Controlled by fusible links. Made to Underwriters' standards, labeled by Underwriters' Laboratories, Inc., and approved by Factory Mutual Laboratories. Thirty designs of labeled fire doors, including: Fire wall doors, Class "A"; vertical shaft doors, Class "B"; corridor and room partition doors, Class "C," and exterior doors and shutters, Class "D."

Llenroc Type

The most used construction for automatic fire doors. Placed on the face of the wall and carrying A, B, C or D label. Note the fuse link.

Llenroc is Cornell spelt backwards and denotes automatic doors labeled by Underwriters Laboratories, Inc.

Cornell Improved Interlocking Steel Slat Curtains

Designed to give unusual rigidity against wind pressure, having a depth at the crown of 7/8 in. The appearance is attractive from either side, as the curtain is made up of a series of cold rolled steel mouldings with deep relief.

The end locks are made of malleable iron, designed for maximum wear and strength. Furnished in U. S. gauges from No. 16 to 22, cold rolled and galvanized.

Non-corroding Curtains

Of cold rolled bronze, aluminum or zinc, interlocking slats. An original Cornell product. Require no painting. Of great service in resisting coal gas, acid fumes, severe salt water exposure, etc. Give a very handsome finish at comparatively small extra cost.

Cornell Patented Non-corroding Curtain Bottoms

Experience proves that all exposed doors and shutters of steel corrode fastest at the bottom.

To neutralize this, Cornell Iron Works, Inc., has originated the feature of using 12 to 18 in. of bronze bottom slats for exposed doors.

The extra cost is small and the life of the installation may often be more than doubled by this method.

Widest Rolling Door Ever Made—45 ft., Motor Driven

Motor Driven Units

Cornell motor drives are made in a self-contained unit, completely assembled in the shop. The gears can not get out of alignment.

The worm is placed under the worm wheel, is completely enclosed, and runs in an oil bath.

Automatic starters are furnished with all installations.

Electric brakes are furnished where required.

Equipment is G-E material.

Operation—On pushing the proper button, the solenoid acts to open the brake and the door moves up or down, as the case may be, at a rate of approximately 1 ft. per second.

On reaching the top or bottom of the door travel, the limit switch operates, automatically cuts off the current, stops the motor, cuts out the brake magnet and lets the brake go on with full power, locking the entire mechanism against further travel.

The action is foolproof.

Door may be stopped at any point in its travel, by simply throwing the switch. This operation automatically puts on the brake, and the door stops promptly.

Underwriters' Labeled Fire Doors

Cornell rolling doors have been thoroughly tested by Underwriters' Laboratories, Inc., Chicago, and carry their label for the following types of openings:

Fire Wall Doors—Made of No. 16 gauge and labeled up to 80 sq. ft. in size—Class A.

Vertical Shaft Doors—Made of No. 20 gauge and labeled up to 80 sq. ft. in size—Class B.

Corridor and Room Partition Doors—Made of No. 20 gauge and labeled up to 80 sq. ft. in size—Class C.

Exterior Doors and Shutters—Made of No. 22, or No. 20 gauge, and labeled up to 100 sq. ft. in size—Class D.

Note: Doors larger than the above limits can be made to Underwriters' specification and a certificate of inspection furnished.

KINNEAR ROLLING DOORS
TRADE-MARK

Types

Kinnear steel rolling doors and shutters are manufactured and sold under two distinct classifications, viz., Service and Labeled Types. Service doors are designed entirely for such openings as do not require underwriters' label and where insurance rates are not a consideration.

Construction of Steel Rolling Doors

Kinnear steel rolling doors are constructed of the highest class of materials by mechanics especially trained in the exclusive manufacture of doors.

Curtain proper on all Kinnear doors is made of open hearth interlocking steel slats galvanized and equipped with malleable iron endlocks. Curtain is coiled upon barrel journalled in heavy cast iron brackets and travels in steel guides mounted at sides of openings.

Curtain is counterbalanced by means of helical springs which are enclosed in barrel.

Galvanized hood of steel of suitable design is supplied with each door.

Method of Installing Rolling Doors

Service doors in general are mounted on face of wall with brackets and coil entirely above the bottom of lintel and with inside face of guides flush with face of brick or concrete jamb.

Where headroom is limited and door can not be mounted on face of wall, it can be mounted in the opening, in which case the brackets and coil would be mounted directly under lintel and guides would be located on the jamb.

Operation of Rolling Doors

Doors may be operated as follows:

Push-up type of doors for openings not exceeding 100 sq. ft. can be operated in the same manner as window shade, being perfectly counterbalanced and same can be opened from either side.

Doors can be operated by means of reduction gearing and endless chain, or by means of crank, shafting and gear.

Where motor operation is desired, it is necessary to have complete description of current and drawing showing clearances and general conditions.

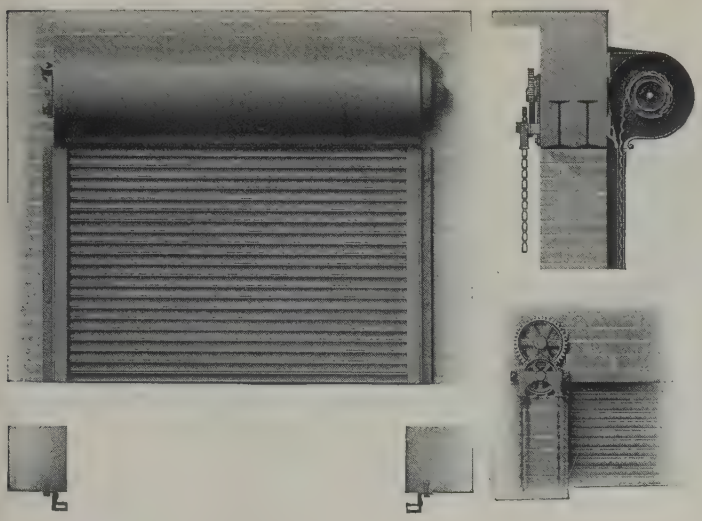
Concave and Convex Sides of Interlocking Steel Slat No. 2

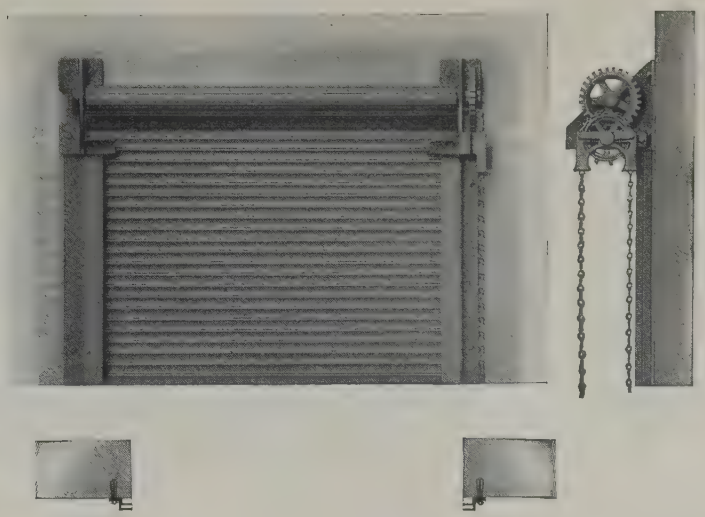
Illustrations to the left show slat No. 2 fitted with alternate endlocks; those to the right, fitted with continuous endlocks. Slat No. 2 is 1⅞ in. wide on centers; depth of crown, ½ in. Made in gauges Nos. 24, 22, 20, 18 and 16.
Especially adaptable to shutters equipped with mechanical operating device.
In cases of extremely wide openings, Kinnear No. 4 slat is used. This type of slat is larger than the No. 2 slat

Continued on next page



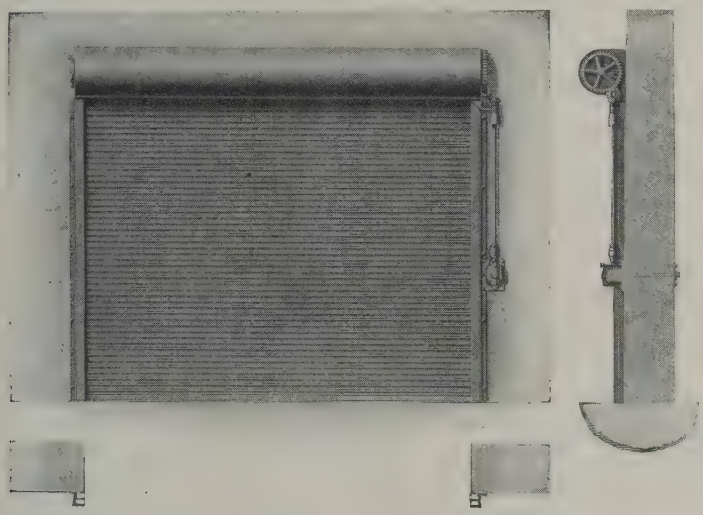
Construction No. F.H. 61

Door mounted on exterior face of wall. Operated from within building by means of endless chain, sprocket and gear, and by shaft extending through the wall. May be locked on inside by means of a chain lock



Construction No. F.H. 30

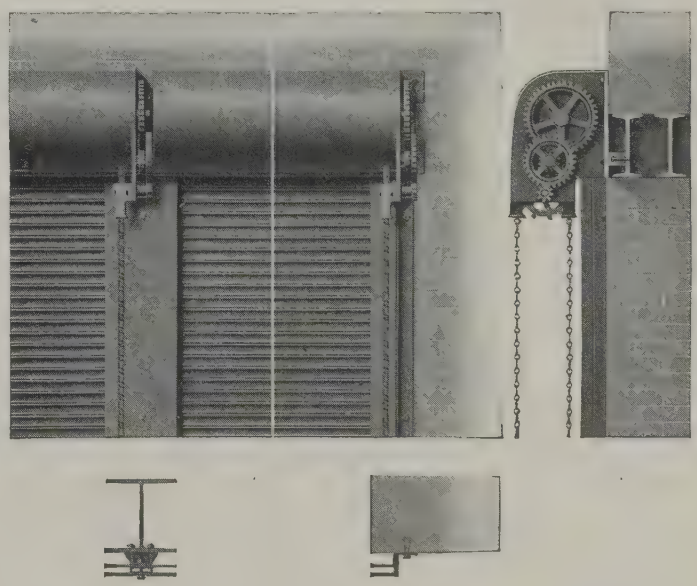
Mounted on interior face of wall; not furnished with hood. Open type of bracket facilitates erection. After brackets are in place, curtain barrel can be dropped into bearings. Closed brackets necessitate erection of both brackets and barrel together



Construction No. F.C. 20

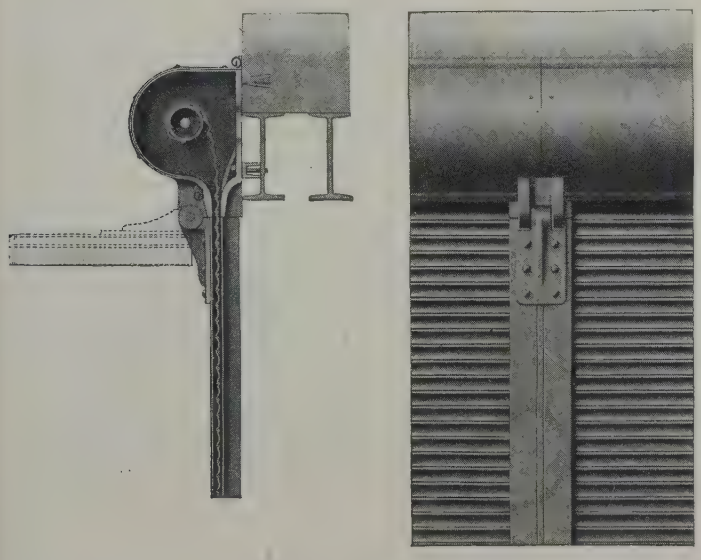
Mounted on face of wall. Operated by means of crank, imparting movement to the curtain barrel through shaft and suitable gear. Can be made to operate from either inside or outside of building, or both.

Operation from one side only is standard arrangement



Construction No. F.H. 23

Modification of construction No. F. H. 20. A compact design well adapted to large openings, separated by narrow post



Intermediate Movable Posts

Wide openings can be frequently more economically closed by a number of small doors, than by a single large one, using, between doors, movable posts hinged to brackets. After doors are open, posts are swung up out of the way by ropes and pulleys

Interior of Pier 32, San Francisco

Steel rolling doors arranged with movable intermediate posts shown above, making entire opening available

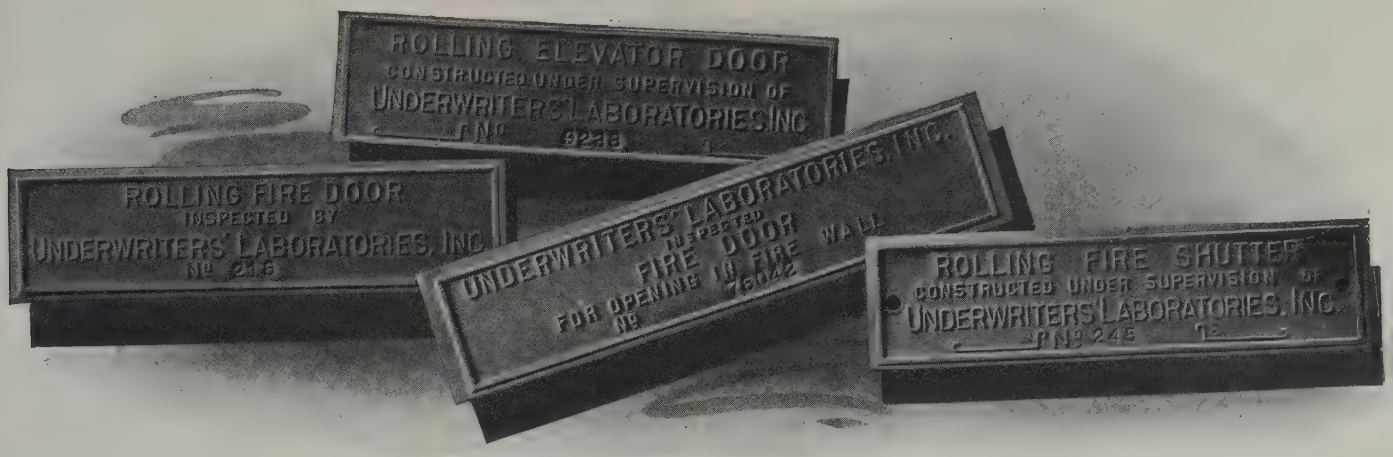
Projections (Schedule Below)

Above are indicated the salient dimensions of usual sizes of standard service types of Kinnear steel rolling shutters. View to the left shows shutter placed on face of wall; central view shows shutter placed between jambs, and that to the right shows curtain with concealed coil. The following dimensions are for shutters of height and width indicated:

Height ft.	Width 3 to 7 ft. Groove depth "D," 2 in. Y in.	X in.	P in.	A in.	W in.	Width 7 to 11 ft. Groove depth "D," 2½ in. Y in.	X in.	P in.	A in.	W in.	Width 11 to 14 ft. Groove depth "D," 3 in. Y in.	X in.	P in.	A in.	W in.	Width 14 to 20 ft. Groove depth "D," 3½ in. Y in.	X in.	P in.	A in.	W in.
6	12¾	12¾	3	4	3	12¾	14	3	4½	3½										
8	14¼	14¼	3	4	3	16½	18	3	4½	3½										
10	15¼	17	3	4	3	17½	19	3	4½	3½										
6	11	13	2½	5	3	11	13	2½	5½	3½	12¾	14	2½	6	4	15	17	3½	8	4½
8	11	13	2½	5	3	11¼	13½	2½	5½	3½	12¾	14	3½	6	4	15	17	3½	8	4½
10	11¾	13½	3½	5	3	11¾	13½	3½	5½	3½	13½	15	3½	6	4	15½	18	4	8	4½
12	13½	15	3½	5	3	13½	16	3½	5½	3½	13½	16	3½	7½	4	17	19	4	8	4½
14	14¼	16	3½	5	3	14¼	16½	3½	5½	3½	15¼	17	3½	7½	4	17½	19	4	8	4½
16	15¼	17	3½	5	3	15¼	17	3½	7	3½	16¼	18	4	7½	4	20	22	4	8	4½
18	15¾	17	3½	5	3	15½	18	3½	7	3½	17	19	4	7½	4	22	24	4	8	4½

Sizes above division line apply to shutters operated by handle in bottom of curtain. Those below division line apply to shutters operated by endless chain or crank and bevel gear. Dimension "P" applies only to face of wall constructions. Dimension "W" only to "between jamb" constructions. Dimension "D" in the between jamb section applies only to manually operated shutters. Use projection "A" for both sides where chain operation is used. Dimension "B" should always be at least 8 in. wider than width of door opening for moderate sized shutters, and for very large shutters 10 or 12 in. and more if possible. We do not recommend manually operated construction for curtains of larger area than approximately 100 sq. ft.; chain hoist should be used on larger sizes. Any unusual sizes, direct correspondence is advisable.

Continued on next page



Underwriters' Labels

Fire Doors and Shutters

Constructed under the supervision of the Underwriters' Laboratories, Inc., and labeled as above.

Important Features—Kinnear fire doors and shutters are specially designed for fire protection.

Details of construction have been carefully developed. The following are some of the important features:

(1) An auxiliary or inner hood is automatically dropped and closes the space between the barrel and outer hood, thereby preventing the passage of flame over the barrel.

(2) Special endlocks closing the concaved ends of slats and preventing the passage of flame around the edge of the curtain.

(3) Fusible washers employed in the construction of grooves which melt and allow the members composing the grooves to expand without buckling.

(4) Non-corrodible metal used for bearings and contact points of the automatic release.

(5) Single line contact bearings in releasing levers.

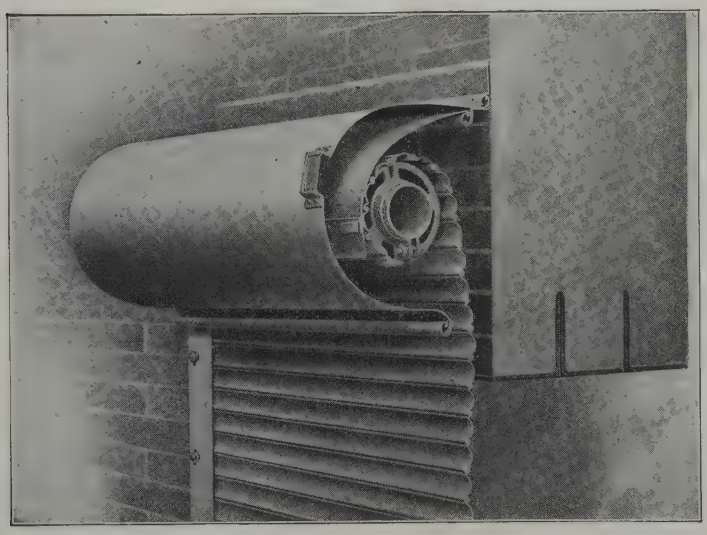
(6) Provision made for expansion of parts for all temperatures up to 2000° F.

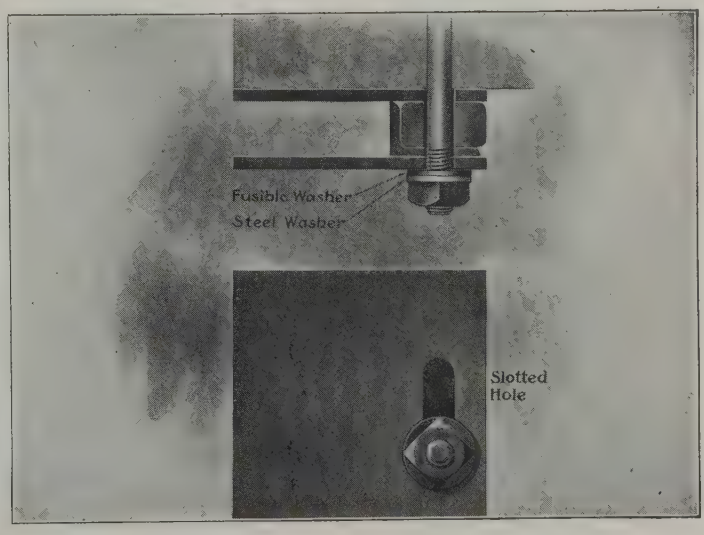
(7) Disposition of fusible links, insuring prompt closing.

(8) The enclosure of automatic release, protecting it from the weather.

(9) Safety device controlling the speed of curtain in automatic closure.

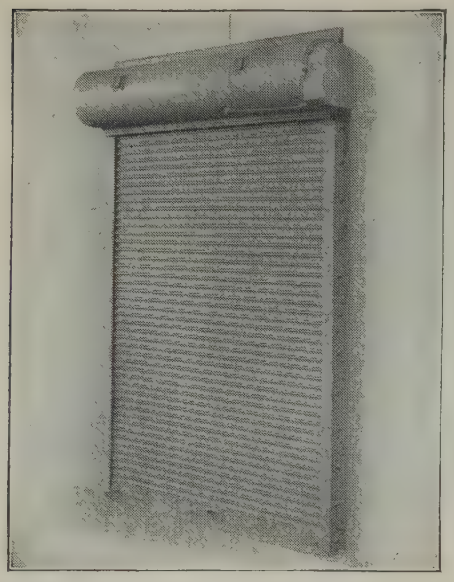
Catalogues—General Catalogue No. 51 and the special Fire Door Catalogue No. 53 illustrate many additional types and their applications. These doors and shutters are designed to obtain easy operation in normal service, and are easily opened and reset by a single person after automatic closure.



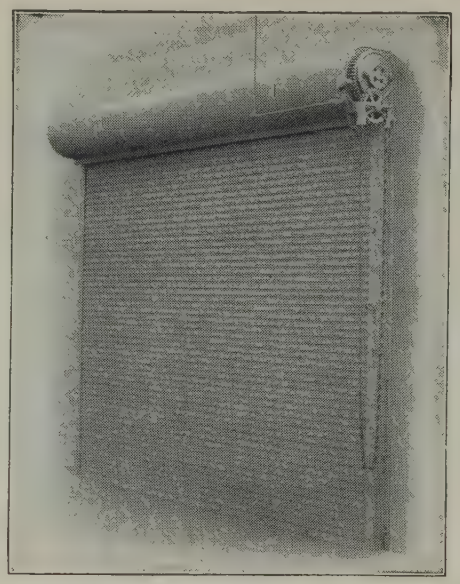


Salient Features of Kinnear Fire Doors and Shutters

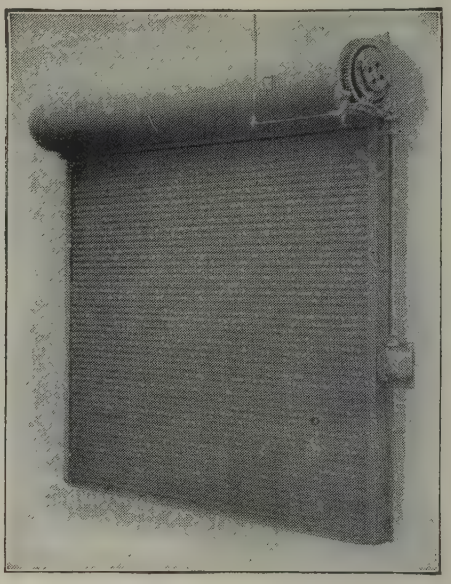
Continued on next page



Manual Operation



Chain Operation



Crank and Shaft Operation

A Few Types of Akbar Construction

Salient Features of Akbar Construction, a Distinctive Kinnear Product

(1) The automatic closing of this type of door is insured by a powerful starting force which diminishes as door is set in motion.

(2) A special safety device is provided on each door which controls drop of door in automatic closure and which eliminates every element of danger, as well as the violent impact common to other types.

(3) Can be opened and reset without difficulty after automatic closure.

(4) Are available for service purposes at all times and will close automatically from any open position.

Types—Akbar doors are made in the following types:

Akbar No. 1, manual operation
Akbar No. 2, chain operation
Akbar No. 3, crank operation

The above three types are labeled for openings in vertical shafts, partition walls, bridge and tunnel entrances where openings do not exceed 80 sq. ft. and where width or height does not exceed 12 ft.

Akbar No. 4, manual operation
Akbar No. 6, chain operation
Akbar No. 7, crank operation
Akbar No. 8, crank operation

The above four types are labeled for openings in fire walls not in excess of 80 sq. ft. and where width or height does not exceed 12 ft.

Akbar No. 11, manual operation.
Akbar No. 9, chain operation
Akbar No. 10, crank operation

The above three types are labeled for openings in exterior walls for openings not in excess of 100 sq. ft., and where width or height is not in excess of 12 ft.

Other types similar to Akbar manual operation are available for exterior openings.

Salient Features of Superior No. 1 and No. 2 Constructions

Labeled for exterior window openings not in excess of 100 sq. ft., neither dimension exceeding 12 ft.

Normally remains in open position, closing automatically by means of fusible link.

Actuated by a powerful starting force which diminishes as shutters are set in motion.

Equipped with *safety device* which controls drop of door in automatic closure, eliminating all danger, as well as impact on sill.

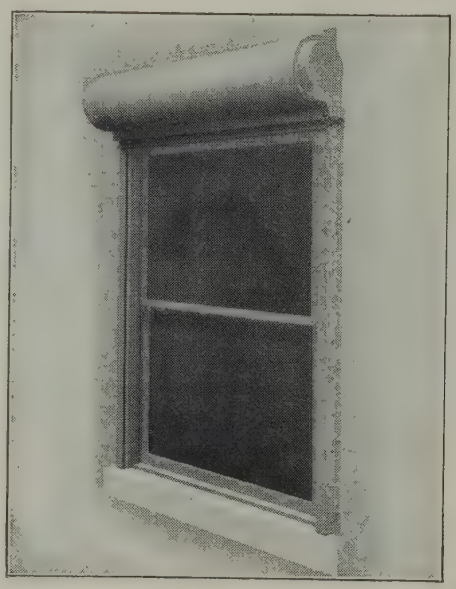
Equipped with testing device by which periodical tests can be made as often as desired.

Can be raised after automatic closure with least possible difficulty.

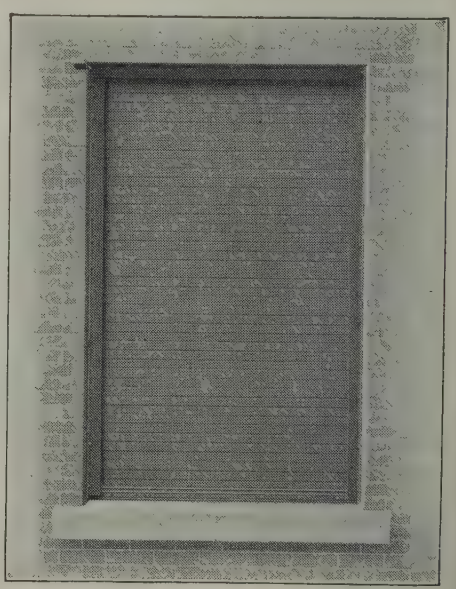
After lever is reset, can be pushed and locked in any open position without adjustment.

Superior No. 1 to be mounted on face of wall.

Superior No. 2 to be mounted in opening.



Superior No. 1



Superior No. 2

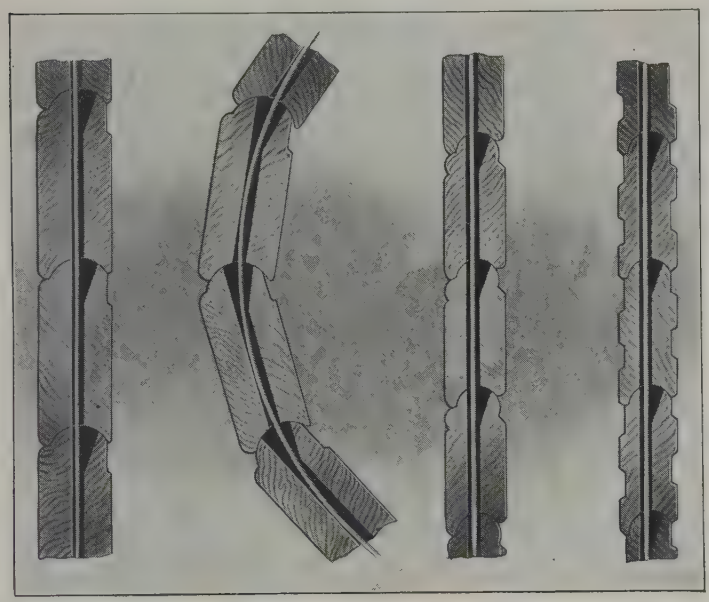
Wood Rolling Doors and Partitions

For Roundhouses—Wood rolling doors are particularly desirable in cases where chemical action is liable to deteriorate steel. This is particularly true in roundhouses and chemical plants.

These doors are constructed of wood slats assembled on phosphor bronze ribbons placed at proper intervals. Slats are made of cypress and treated with a coat of wood preservative.

Slat No. 27 is used on exterior doors.



No. 27 No. 27 No. 26 No. 24

Sections of Wood Slats

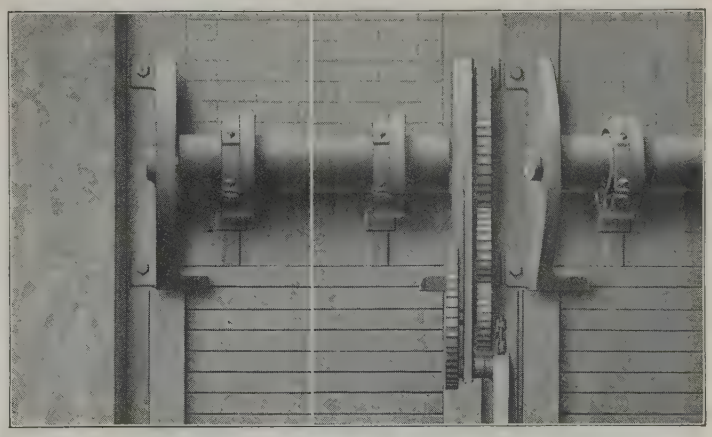
For Schools, Churches, etc.—Curtains are composed of slats assembled on phosphor bronze ribbons.

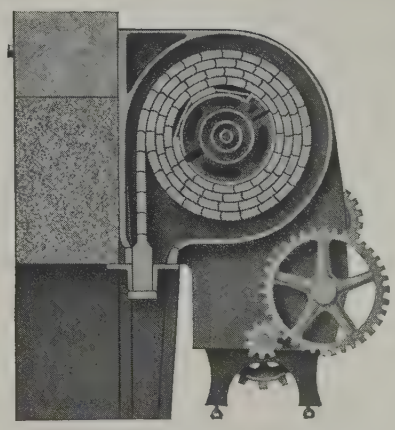
Made in long leaf yellow pine, cypress, quarter sawed oak and birch.

Slats Nos. 24 and 26 are for interior work; slat No. 27 for exterior work.

Illustration shows cross section through slats.

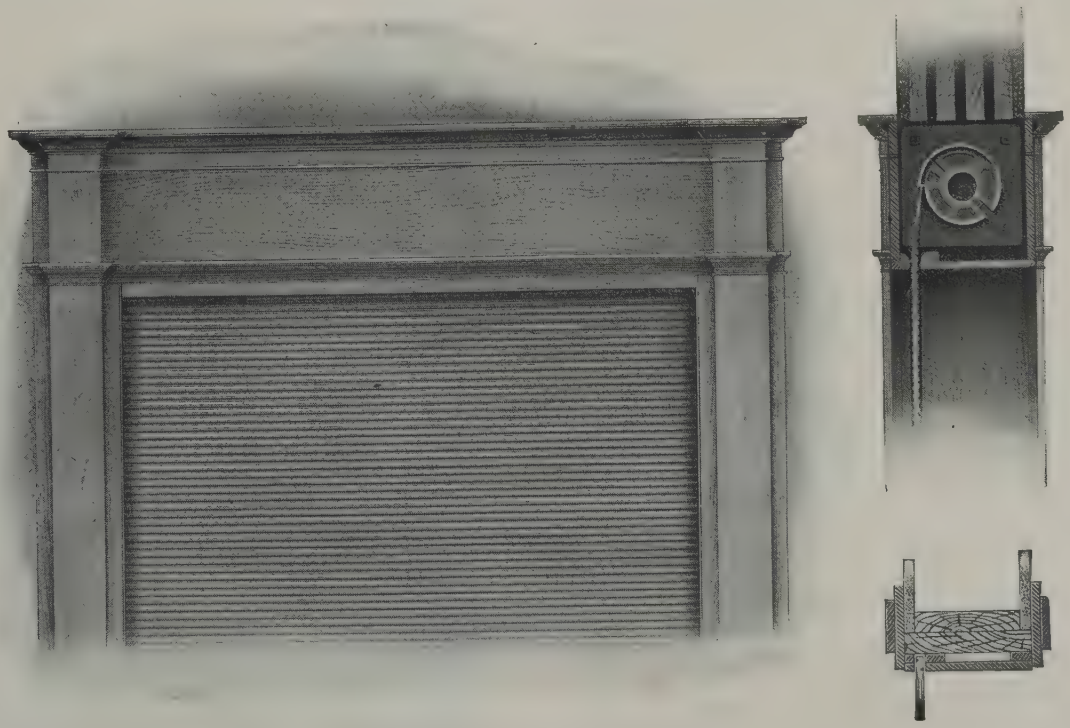
The opening through which the ribbon passes is so shaped that, during flexure of the curtain, there is no change in the relative length of the slats or curtain; nor is there any danger of pinching the ribbon.





Construction No. F.H.W. 22

Designed especially for roundhouses. Doors mounted on face of wall above opening; travel in grooves at sides. Counterbalanced by springs; operated by means of endless chain and reduction gear



Construction No. W.B.M. 10

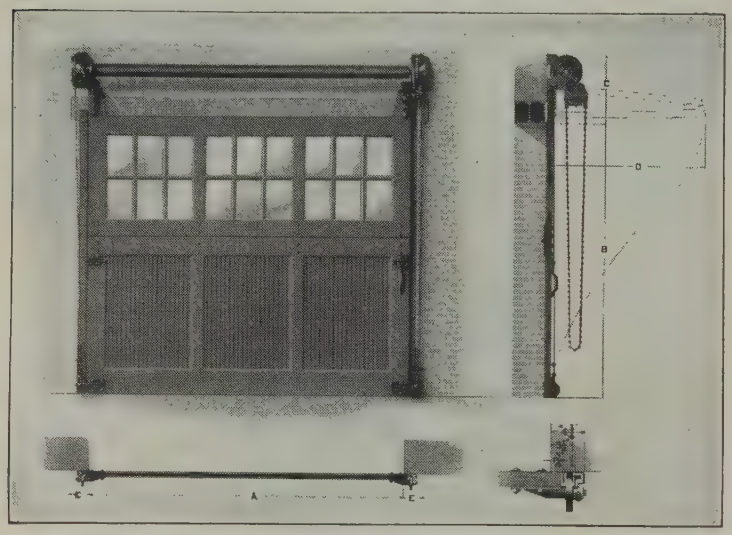
Application of wood rolling door for interior partition. Coil is concealed under lintel; operated by means of handle in bottom of rail. Mechanical operating devices are arranged for large doors. Can be concealed within the casing. Casing and grooves are not supplied, but should be included in general carpenter work.

Continued on next page

Bifolding Doors, Wood or Steel

In cases where light is desired through doors, the bifolding type lends itself readily to such condition. These doors may be constructed either of wood or steel, and are of two sections hinged at the center and pivoted at top of opening. The upper panel may be fitted with sash, giving a glass area of about two-thirds the total area of the panel.

Bifold No. 5—This is without doubt the most practical bifolding door now on the market, requiring less clearance at both head and sides of opening than do most other types.



Bifold No. 5

CLEARANCES REQUIRED FOR BIFOLD NO. 5

Height										
B	6′ 0″	7′ 0″	8′ 0″	9′ 0″	10′ 0″	11′ 0″	12′ 0″	13′ 0″	14′ 0″	15′ 0″
C	26½″	26½″	26½″	26½″	28½″	31″	33″	35″	35″	37″
D	3′ 10″	4′ 4″	4′ 10″	5′ 4″	5′ 11″	6′ 6″	7′ 1″	7′ 8″	8′ 2″	8′ 9″
E	8″	8″	8″	8″	8″	10″	10″	10″	10″	10″

Dimension A should not exceed 18 ft; dimension B should not exceed 15 ft.

Kinnear Bifold No. 5 is designed with a spring counterbalance, eliminating the heavy counterweights usually used on this type of door. Steel cables connect the door to the counterbalancing device at the top of the opening. Bottom panel is fitted with rollers which travel in guides attached to wall and transmit the thrust.

The simplicity and sturdiness of the mechanism reduces maintenance to a negligible factor and renders quick and easy operation. Less side clearance is required as there are no counterweights. Send us a sketch showing conditions as they actually exist and we will show how this flexible construction adapts itself to other than standard conditions.

Kinnear panels are fabricated in our own factory from extra heavy materials and are built on a purely quality basis. Write for prices and catalogue.

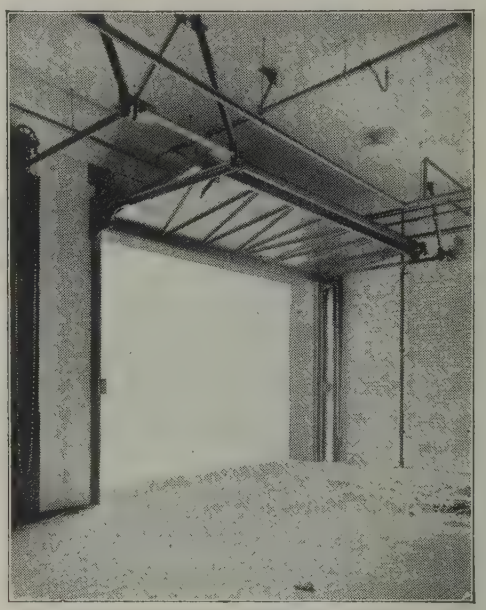
Bifold No. 3—Designed for large openings. Panels are built in two sections. Upper section may carry glass if desired.

In operating, the lower section rises to half the height of opening. The door then breaks, and both sections move simultaneously, the lower edge vertically, the upper edge horizontally, on suspended tracks to a position above the opening.

Panels are entirely counterweighted and operated by means of reduction gearing and endless chain.

This type of door was used in the Boston, Brooklyn, and Charleston army bases by the United States government.

Panels can be constructed either of wood or steel.



Bifold No. 3 in Open Position

Vertical Sliding Doors

This type of door is particularly suitable for freight houses, piers and warehouses where light is essential through doors.

The door comprises two or more sections consisting of trussed frame covered with corrugated iron, hung independently with chains connected with counterbalance weights. Operated by means of endless chain and suitable reduction gearing.

Where doors are mounted on steel columns, guides and weight boxes should be incorporated as a part of the column, and should be supplied by the steel contractor, according to details supplied by our Engineering Department.

This type can also be supplied to be mounted on the face of the wall, in which case we furnish weight box and guides as part of the equipment.

It is advisable to procure definite information from the factory in connection with the above type of door.

Vertical Sliding Doors, Installed in Santa Fe Freight Shed

Continued on next page

Kinnear Power Units

Rolling doors are especially adaptable to electric motor operation and Kinnear power units are available for all sizes of rolling doors. If the arrangement as shown in the illustration is not feasible other applications can be provided.

Electric Power Operation—

The rolling doors are operated by means of the motor driving the curtainbarrel through reduction gearing. The operation is accomplished by the following means:

By pushing a button on the operating switch the pilot circuit is closed through the magnet of the automatic starter which then closes the main circuit through the motor. The motor then operates the door. The limit switch will at the termination of the travel break the current through the automatic starter magnet, which will consequently interrupt the motor circuit and simultaneously the magnet brake will close, stopping the motor. The door can be stopped at any intermediate point by means of the stop button on the switch from where it can be operated either up or down.

Electric Motor—

Series wound motors with high starting torques are used for direct currents and high torque elevator motors for alternating currents.

Lubrication—

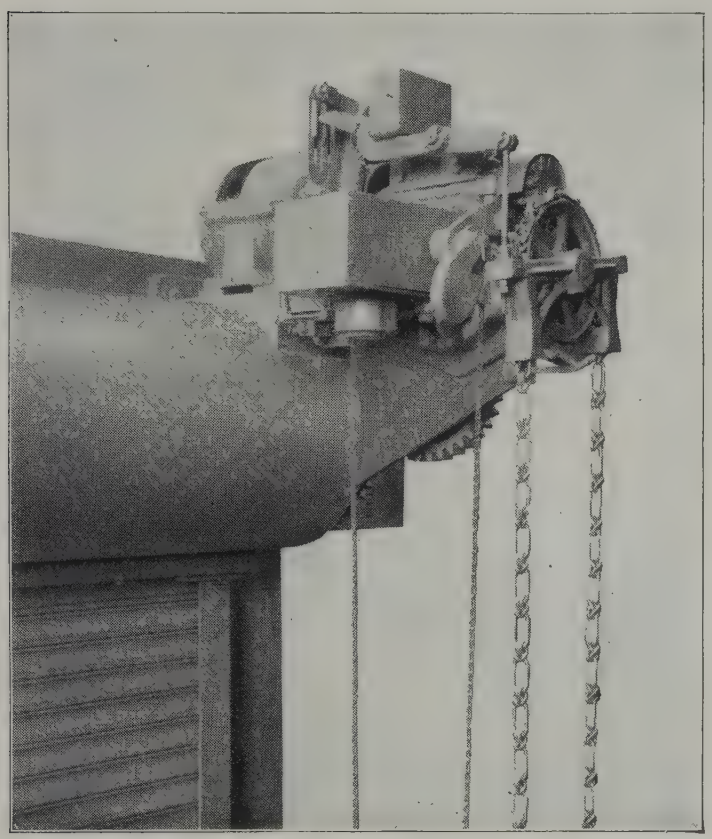
Means are provided for the lubrication of all bearings.

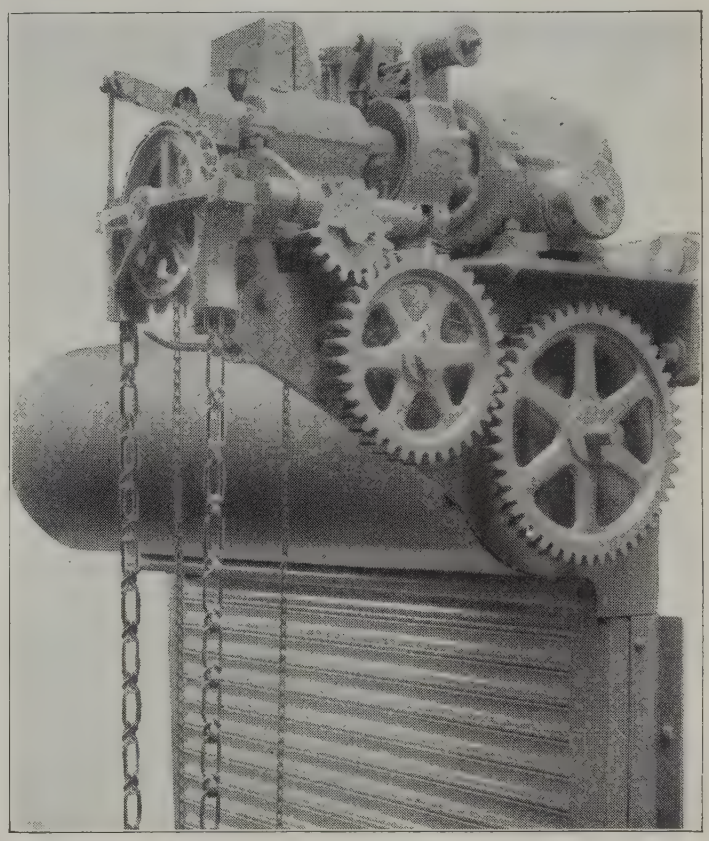
Emergency Operation—

For cases of emergency, means are provided for the operation of the door manually with sprocket and chain. This emergency device is disengaged during motor operation and the control for engaging and disengaging this device from the driving mechanism is operated from the floor. Arrangements are provided that prevent the motor from operating until this device is disengaged.

Control Switches—

The control switches consist of a fused service switch, enclosed safety type and externally operated; heavy duty 3 push button switches with open, close and stop buttons, and a remote control magnet reversing panel switch. The reversing panel is enclosed and furnished with a thermal overload relay.





Kinnear Power Units

Wiring—

The wires, wire conduit and fuses are not furnished or installed by The Kinnear Manufacturing Co., but are to be established in accordance with the diagram supplied by the Kinnear Company.

Engineering—

Details, specifications and other information will be furnished upon request. All requests for engineering data or quotations must be accompanied by the electrical current characteristics as follows:

Alternating current: voltage .... phase .... cycle ....; direct current: voltage.

In General—Kinnear power units are the result of years of painstaking effort, are compact, sturdy, and are long past the experimental stage.

Kinnear motor operated doors are in general use everywhere and are great time savers on large openings.

If you have door problems it will give us pleasure to help develop them.

Write for detailed information.

ESTABLISHED 1900

GEO. W. JOHNSON MFG. CO.

INCORPORATED 1906

Johnson Steel Rolling Doors and Shutters

ST. LOUIS, MO. KANSAS CITY, MO.

REPRESENTATIVES IN PRINCIPAL CITIES

Products

STEEL ROLLING DOORS and SHUTTERS.

Types

Johnson Steel Rolling Doors and Shutters are furnished in two general types:

(1) Service doors and shutters—where labels are not required;

(2) Underwriters' labeled doors and shutters—for the protection of openings where insurance rates are a consideration.

Labeled doors and shutters are built in strict accordance with the Underwriters' requirements for proper classification of the openings for which they are intended. They are inspected and labeled at our factory by a representative of the Underwriters' Laboratories, Inc.

The Underwriters classify openings, and specify gauges of curtains as follows:

Division fire wall	Class A—No. 16 U. S. gauge
Interior vertical shaft	Class B—No. 20 U. S. gauge
Corridor or room partition	Class C—No. 20 U. S. gauge
Exterior wall	Class D—No. 22 U. S. gauge

Labels are attached to doors for openings not over 80 sq. ft. in area for classes A, B, and C, and not over 100 sq. ft. for class D, with a maximum allowable dimension of 12 ft. in either width or height for all classes. "Certificates of Inspection" are furnished in lieu of labels for doors exceeding these limits.

Operation

Push-up, by means of handles on bottom plates of nominal sized doors.

By chain, sprocket and reduction gearing.

By crank, shafting and reduction gearing.

By electric motor operating equipment.

Installation

Generally on face of wall with brackets and shaft above the lintel. Where necessary or desirable, with brackets within the opening under the lintel and with guides attached to the jambs. Such an installation can be made in existing openings, but better method is to prepare the opening by providing pockets for the brackets and rabetted jambs to receive and protect the guides.

Advantages

Steel rolling doors leave entire floor space available; are easily operated regardless of size, are economical in maintainance, are long lived, and are unaffected by climatic changes.

Construction Features

The drum, on which the curtain coils, revolves on *roller bearings* around a center shaft which is *stationary* and is supported by the end brackets. Highest grade oil-tempered flat motor springs, contained in the drum, are used to counterbalance the weight of the curtain. *Speed and ease of operation are assured by the use of roller bearings, and adequate provision for lubrication is supplied by alemite fittings installed on all principal bearings.* This drum also supplies continuous support to the top end of the door curtain.

Curtains are constructed of interlocking slats formed from rust-resisting cold rolled steel galvanized to meet the requirements of the Underwriters' Laboratories, Inc. Malleable iron endlocks, riveted to the curtain edges, prevent lateral movement of the slats and provide a wearing surface in the guides.

Brackets are constructed of reinforced steel plates, this construction combining great strength with minimum weight, and readily adapting itself to the difficult and unusual requirements often encountered.

Castings are soft gray iron, malleable or steel, moulded from properly designed metal patterns and fully machined where required. Steel or malleable iron castings are used for all parts requiring great strength, and all gear shafts are of cold rolled steel.

Sheet metal hoods are furnished on all doors, and where required, doors are provided with means for locking.

Motor Operators—Assembled at our factory from standard units. The motor, magnetic solenoid brake, enclosed reduction gears running in oil, and power driven limit switch, are compactly mounted on a bed plate. Control equipment usually consists of a magnetic reversing switch in conjunction with one or more push button stations with "open," "close" and "stop" buttons. All gears employed on motor operated doors are machine cut from steel, and provision is made for emergency operation by hand.

TRADE-MARK

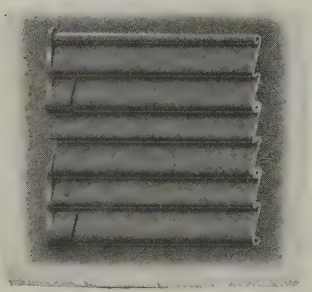
"Mecco" Steel Rolling Doors

Advantages—All-steel rolling doors have certain recognized general advantages over doors of other types. "Mecco" doors have other points of superiority that have won general recognition and are of special interest to architects, engineers, owners and contractors, viz.:

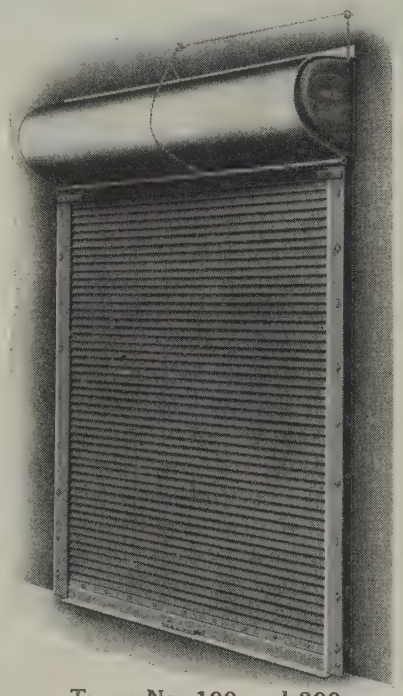
(1) Ease of erecting "Mecco" doors.

(2) Ease of operating "Mecco" doors.

(3) Extremely low maintenance cost.



Slats with Malleable End Locks Attached



Types No. 100 and 200
Labeled for interior opening not exceeding 80 sq. ft. in area or 12 ft. in width or height

Underwriters' Labeled Doors—The following "Mecco" doors are approved and labeled by the National Board of Underwriters for openings, methods of operation and mounting as listed:

Type No.	Operation	Location	Operated by
Fire Wall Doors			
100	Automatic	Face of wall	Handles
102	Automatic	Face of wall	Crank
104	Automatic	In opening*	Handles
106	Automatic	In opening*	Crank
Doors for Vertical Shaft, Corridors and Room Partitions			
200	Automatic	Face of wall	Handles
202	Non-automatic	Face of wall	Handles
204	Non-automatic	Face of wall	Chain
206	Automatic	Face of wall	Crank
208	Non-automatic	Face of wall	Crank
210	Automatic	In opening*	Handles
212	Non-automatic	In opening*	Handles
214	Non-automatic	In opening*	Chain
216	Automatic	In opening*	Crank
218	Non-automatic	In opening*	Crank
Doors and Shutters for Exterior Openings			
300	Automatic	Face of wall	Handles
302	Non-automatic	Face of wall	Handles
304	Non-automatic	Face of wall	Chain
306	Automatic	Face of wall	Crank
308	Non-automatic	Face of wall	Crank
310	Automatic	In opening*	Handles
312	Non-automatic	In opening*	Handles
314	Non-automatic	In opening*	Chain
316	Automatic	In opening*	Crank
318	Non-automatic	In opening*	Crank

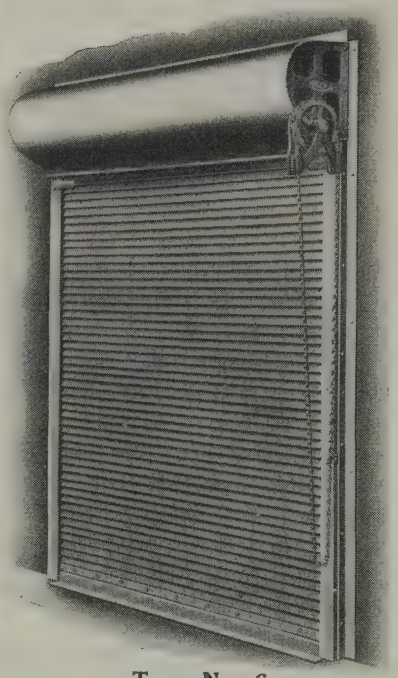
Note: "In opening" refers to doors under the lintel and between jambs.

Types of Installation—The type of installation most frequently used has the coil mounted on the face of the wall above the opening. Where headroom is limited, the coil and the brackets are mounted under the lintel and guides placed on the jambs. A large opening may be filled with several doors using removable posts.

Slat Construction—"Mecco" slats are rolled from galvanized copper bearing open hearth steel of best grade, with easy curves to prevent crystallization.

The modified Z-form makes this slat unusually strong and able to resist great pressure.

"Mecco" slats are extra wide, thus reducing the joints by 50%—a real advantage needing no explanation.



Type No. 6
Erected on face of wall, operation by chain and gear

Methods of Operation—(1) Handle on bottom bar. This is the push-up type, operated like a window shade. May be operated from either side of the opening. The area for the push-up type should not exceed 100 sq. ft.

(2) Operation by reduction gears and an endless chain.

(3) Operation by gears, shafting and crank.

(4) We also build electric motor operated doors. We must have a complete description of current to quote on or build motor equipment.

"Mecco" Service

Our engineers are at your service at all times to give any data required. Quotations will be furnished on any quantity or type. Get "Mecco" service and quality.

"Mecco" Kalamein Doors

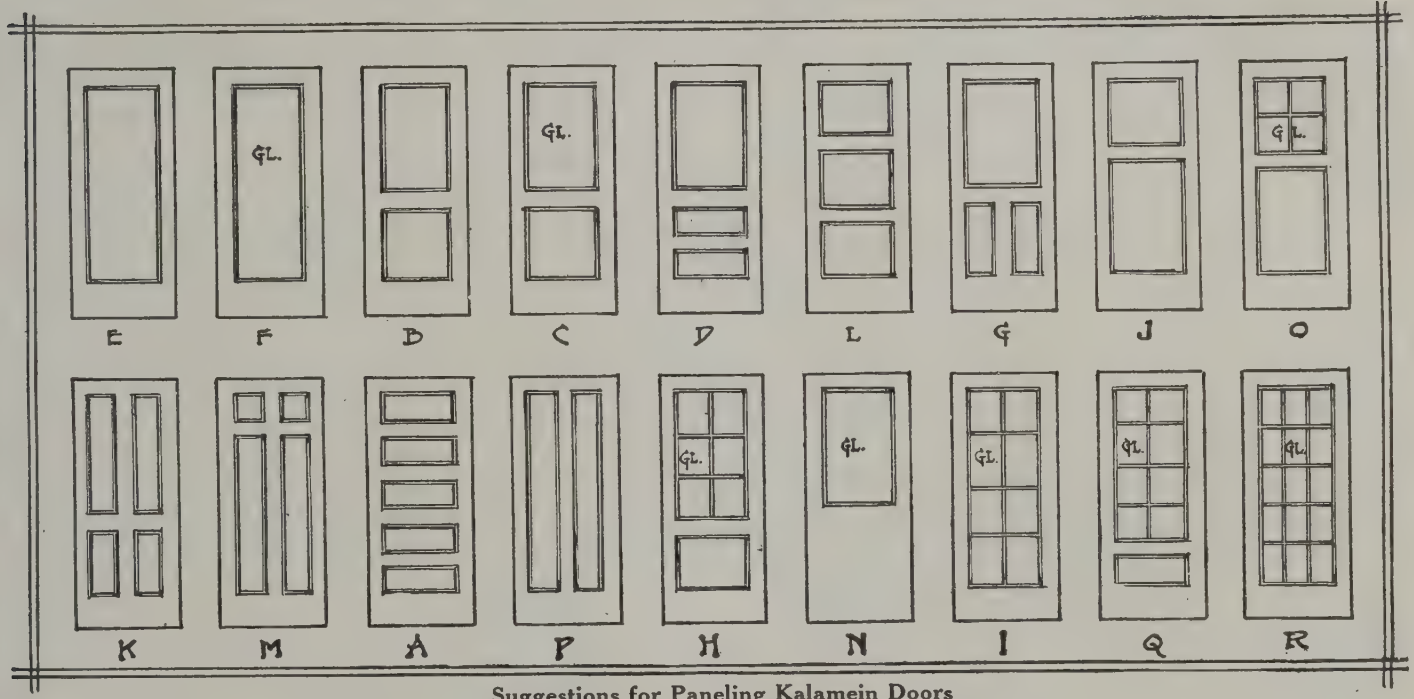
We manufacture a complete line of kalamein doors, covered with stretcher leveled kalamein iron, copper or bronze. Frames may be wood core, metal covered, or of steel, either hollow or solid.

Doors covered with kalamein iron are ordinarily supplied with a prime coat of paint. We, however, can supply any desired enamel finish, or doors grained in imitation of any kind of wood. Cut shown to right is of doors covered with No. 20 gauge bronze.

Labeled Kalamein Doors

We can supply labeled kalamein doors or frames. Doors with metal panels may be labeled for "Vertical Shaft," "Corridor" openings or "Fire Escape" openings. Doors with glass can not be labeled for vertical shaft.

Installation of Bronze Kalamein Doors



Suggestions for Paneling Kalamein Doors

Ball Gymnasium, Indiana State Normal School, Muncie, Ind.

"Mecco" Hollow Metal Windows

We manufacture a complete line of hollow metal windows of every type, labeled by the National Board of Fire Underwriters.

Double Hung Type—The cut to the left shows an installation of "Mecco" double hung windows.

We have hundreds of such installations in high class office buildings, terminal buildings, stores and other semipublic and private structures.

The sash of windows are made to slide perfectly and yet the design and workmanship are such as to exclude the elements. "Mecco" windows are labeled.

MAJESTIC IRON WORKS, INC.

Standard and Underwriter's Labeled Steel Rolling Shutters and Doors; Electric Motor Equipment for Standard Doors

TELEPHONE
RANDOLPH 7375, 7376

559-561 West Fulton Street
CHICAGO, ILL.

Products

MAJESTIC STEEL ROLLING SHUTTERS; ELECTRIC MOTOR EQUIPMENT for standard doors.

Majestic Steel Rolling Shutters

Important Features—The shutter revolves on hardened steel roller bearings which facilitates operation so that any one can raise or lower shutter with ease.

Spool-shaped flanged gears, each end of barrel, which eliminates friction and make curtain self-aligning when revolving.

One-piece sprocket and pinion gear enclosed in housing. Gear lubricated with cup grease.

Hood angular shaped; acts as water shed, protecting gears and mechanism against dirt and weather conditions. No gears exposed.

Bracket bearings on wall self-adjusting should building settle.

Curtain made of No. 16, 18, 20 or 22 gauge galvanized copper-bearing steel which prevents corrosion. Slats interlocking type, malleable iron ends, operating in heavy iron guides.

Each shutter has a counterbalancing helical oil tempered spring. Size and strength determined by size of shutter; enclosed in steel tubing which protects it against atmospheric conditions.

Curtain fastened to barrel on adjustable rings with special attachments—no holes drilled in slats. Bottom of curtain strong and rigidly built.

Guides of extra heavy material able to withstand heavy bumps.

Types—Brackets either on face of wall, under lintel or hung on ceiling.

Installation—Simple to install; any mechanic with ordinary tools can set up. Instruction sheet furnished. Special locking attachment for each shutter.

Service—Consult with us regarding your rolling shutter problems. Our engineers are competent to recommend the type best suited for the conditions existing.

Electric Motor Equipment for Standard Doors

Electric motor operator fully equipped for electrical operation and control, including all standard equipment: motor, limit switch, automatic control, automatic safety device, push button station, etc. All equipment guaranteed by the highest grade manufacturer of electrical motor devices. Hand emergency chain operator is part of the motor equipment.

Where Wilson Rolling Steel Doors Are Used

Wilson rolling steel doors and shutters are designed to meet all classes of service; first, effective closure of openings against weather and intrusion, second, closure of openings where fire doors are required.

Wilson Interlocking Slat Curtain

The Wilson curtain, that part of the door closing the opening, is formed of a series of interlocking slats of Wilson special copper-bearing galvanized steel, conceded by all metallurgical authorities to be more effective in retarding corrosion than any other similar product. By actual experience and practical test Wilson doors will greatly outlast all others.

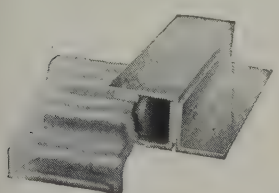
Wilson interlocking slats are made in the three following types:

"Big 4" Interlocking Slat—This slat has distinct advantages possessed by no other slat. Being of corrugated form it has far greater rigidity than the ordinary channel form slat. Its design permits of end-shields which actually do take all wear from that part of the curtain sliding in the grooves. Every part of the Wilson end-shields functions in a definite way, adding considerably to the life of the door.

"Big 4" Interlocking Slat

Deep corrugations also protect the interlocks from damage when hit by moving vehicles. Kinks and dented interlocks will materially affect the operation of other doors.

An exclusive Wilson feature is the patented safety grooves and wind locks which are standard equipment on doors over 14 ft. in width. Doors so equipped cannot possibly be blown from grooves and will withstand any conceivable wind pressure without excessive deflection of the curtain, at the same time minimizing possible damage to curtain from whatever cause.



Safety Groove and Wind Lock

The wind pressure necessary per square foot of shutter to overcome the resistance of Wilson safety knobs is as follows:

18-ft. span 1000 lb. 24-ft. span 500 lb.
30-ft. span 300 lb.

A wind velocity of 120 miles exerts a pressure of 43 lb. per sq. ft.

Curtain has same appearance on either side, thus preserving symmetry when it becomes necessary to hang some doors on inside and others on outside of same elevation.

Made in Nos. 22, 20, 18 and 16 gauge—depending wholly on size of opening.

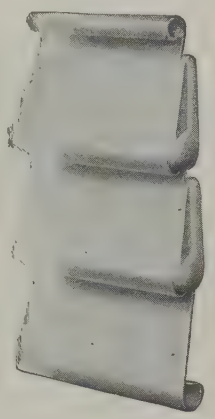
"Little 4" Interlocking Slat—Similar to "Big 4" slat in appearance and design; the depth of corrugation being slightly less, but possessing the same advantages as the "Big 4." Used in small doors for openings where coil must be made as small as possible and for underwriter labeled exterior wall doors. Fitted with fire stops when necessary.

Made in Nos. 22 and 20 U. S. standard gauges.

No. 2 Interlocking Slat—Especially designed for use on underwriter labeled fire doors and other doors installed on interior of buildings when not subjected to wind pressure or unusual hard service.

Made in Nos. 20, 18 and 16 U. S. standard gauges.

The curtains of the underwriter type are equipped with fire stops on the ends of slats, baffle plates in the hood, and (where permitted) automatic devices which cause them to close in case of fire.



No. 2 Interlocking Slat with Fire Stops

Operation of Wilson Rolling Steel Doors

Wilson rolling steel doors may be operated from either one or both sides of opening. Small doors are usually raised and lowered by handles on bottom bar, and large doors are usually operated by chain gear, crank gear, or electrically.

Self-coiling Operation—Wilson types S. C. 11 and 22 are operated by hand by means of handles on bottom bar of door. This type is not recommended on openings over 10 ft. wide or more than 8 ft. in height, or exceeding 80 sq. ft.

Chain or Crank Operation—Should be used for doors larger than the limitations of self-coiling operation. Wilson types C. G. 11 and 22 are operated by means of chain and gear. Wilson type K. G. 11 is operated by crank gear. The chain operated door has been universally adopted as the standard service door.

Motor Operation—Coming into general use since the perfection of Wilson super-equipment, constructed entirely of General Electric products, is being used on doors of most any size and type depending largely on the use of the door.

In view of details envolved, we solicit the opportunity of working on any such installations to insure provisions being made for the proper equipment at a minimum cost.

Continued on next page

Hinged Wicket Doors

Standard size, 2x6 ft., may be placed in any door. Designed so that wicket door with its frame can be swung back out of way with a minimum effort. Substantially built and very practical—used for passage when opening is a means of exit to part of building in which located.

Wilson Rolling Steel Fire Doors (Underwriter Labeled)

Exceptionally durable and equipped with special fire protective devices. Close automatically in case of fire and are approved and labeled by the Underwriters' Laboratories, Inc. for the following services:

Vertical Shafts, Corridors and Room Partitions—Area of opening not to exceed 80 sq. ft.; neither width nor height of opening to exceed 12 ft. Curtains may be hung on face of wall or between jambs, self-coiling or crank operation, and where required are automatic closing in case of fire. Specify Wilson type Nos. 21 to 26, inclusive, interlocking slat No. 2, No. 20 gauge.

Fire Walls—Area of wall opening not to exceed 80 sq. ft.; neither width nor height to exceed 12 ft. Two doors are required and may be hung on face of wall or between jambs, self-coiling or crank operation, and close automatically in case of fire. Specify Wilson type Nos. 31 to 35, inclusive, interlocking slat No. 2, No. 16 gauge.

Exterior Walls—Area of wall opening not to exceed 100 sq. ft.; neither width nor height to exceed 12 ft. Curtain may be hung on face of wall or between jambs,

Details of Wilson Rolling Steel Doors

Continued on next page

self-coiling, chain or crank operation, and, where permitted, may be automatic closing in case of fire. Specify Wilson type Nos. 41 to 51, inclusive, interlocking slat "Little 4," No. 22 gauge.

Automatic Closing Device—Where required, doors close automatically by the fusing of one of two links located at the head or side of opening, and near the ceiling.

Doors close easily on the sill and can be raised immediately after without difficulty. Automatic device can be reset and new link inserted without removing the hood or dismantling the door.

Grooves and bottom bar of door are provided with slotted holes to allow for expansion. Special fusible galvanizing is applied to grooves, allowing freedom of movement during expansion. Bolts for brackets and grooves are bolted through wall or attached to iron inserts furnished and installed by others.

Consultation—Inasmuch as fire doors usually present problems and difficulties, it is suggested that we be consulted for definite details and requirements. A door may be labeled, but will not pass inspection because installation does not meet requirements of the local board, due to construction of opening or conditions surrounding opening.

Wilson Rolling Wood Doors and Shutters

Especially made to withstand the corrosive fumes so destructive to iron and steel. Recommended for roundhouses, powerhouses, chemical plants, refrigerating plants, etc.

Heavy Slat Doors—Made of wood slats 2 in. wide and about 1⅛ in. thick, threaded on bronze bands running from top to bottom about 18 in. apart. Each band is riveted to top slat and attached at bottom to a strong spiral spring anchor of phosphor bronze. This construction allows for shrinking and swelling of door due to atmospheric changes. It requires less than one minute to raise or lower the door.

The doors are treated with carbolineum, reducing to a minimum any expansion or contraction, and acting as a preservative.

Light Slat Doors—Similar to heavy slat type except slats are $\frac{13}{16}$ in. thick. Used on smaller openings or where not subjected to as heavy wear as the heavy slat door.

SCHEDULE OF COIL SIZES

THE VARIETY ROLLING DOOR CO.

Manufacturers of Steel Rolling Doors

FACTORY AND GENERAL OFFICE

221 East Broadway, WESTERVILLE, OHIO

Non-labeled Rolling Doors

Types—Made in construction types: Nos. 20 DM, DH, DC and DHTW; Nos. 41 UM and UH.

Construction No. 20—Simple type of non-labeled shutter mounted on face of wall. It is most frequently used on exterior openings not exposed to fire hazards, and is not automatic unless so specified. Made in all gauges according to size of the opening. Operated manually or with chain hoists. Can also be operated with crank arrangement or by chain hoist from opposite side of wall.

Construction No. 41—Simple type of non-labeled shutter mounted under the lintel. Uses, sizes and operation are the same as No. 20 except that this type is not operated with crank or by chain from opposite side.

Labeled Rolling Doors

For Openings in Exterior Walls—Labeled for openings not exceeding 100 sq. ft. in area or 12 ft. in width or height. Whenever automatic labeled doors are supplied on openings of such size as to necessitate the use of auxiliary gearing, automatic drop hoists are supplied.

Made in construction types: Nos. 60 and 61 DM, DH, UM, UH, DC and DHTW.

Construction No. 60—Simple type of labeled shutter mounted on face of wall or under lintel as desired. This type is not automatic and is generally used on exterior openings, adjacent to a fire hazard which is not sufficiently close to necessitate the use of automatic shutters. Similar in appearance and operation to Type No. 20 or No. 41, with the exception that all requirements of the Underwriters' Laboratories have been met and the door bears their label.

Construction No. 61—Identical in construction with No. 60, except that it is equipped with automatic closing device. Generally used on exterior openings where fire hazards are sufficiently close to cause the Underwriters to demand automatic closing devices.

For Openings in Vertical Hatches and Corridor or Room Partitions—Labeled for openings not exceeding 80 sq. ft. in area or 12 ft. in height or width. Made in construction types: Nos. 33 DM, DH, DHTW, UM and UH.

Construction No. 33—Made in No. 20 gauge or heavier, according to size of opening. It is always automatic. Must have continuous end locks and baffle plates, and governor. Mounted either on face of wall or under lintel, and is operated manually or by means of chain hoist from either side of wall.

For Openings in Fire or Dividing Walls—Labeled for openings not exceeding 80 sq. ft. in area or 12 ft. in height or width. To get maximum credit, doors must be installed on both sides of wall. Made in construction types: Nos. 33-33 DM and DH; Nos. 33-3 UM and UH.

Construction No. 33-33—Similar in construction to No. 33, except that it is always made of No. 16 gauge material and is labeled by the Underwriters for use on fire walls. Mounted on face of wall only, and is operated either manually or by means of chain hoist.

Construction No. 33-3—Similar in construction to No. 33-33, except that it is mounted under the lintel only.

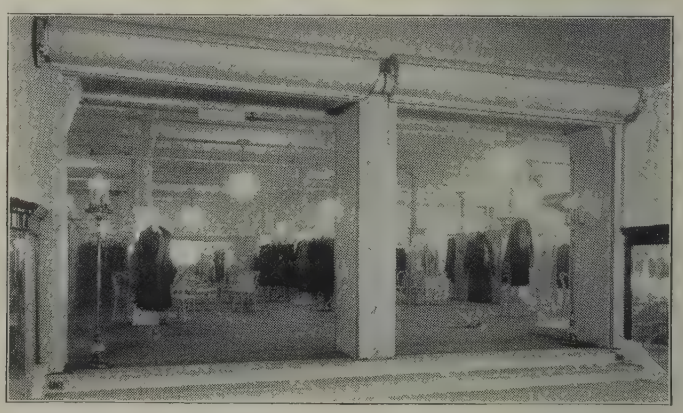
Motor Operated Doors—All service doors may be equipped with motors. The motor units are compactly designed, of sturdy construction and comprise all reduction gears, magnetic brake, limit switches, reversing panel. Emergency hand chain, push buttons or knife switches can be supplied. Conduits or wiring are not included with power units.

Explanation of Construction Letters

The construction numbers and letters used in the legends of the illustrations on the following page completely identify each type and style of door. The first letter refers to the type—"D" indicates that the door is mounted on the face of the wall; "U" indicates that mounting is done under the lintel. The second letter always refers to the method of operation—"M" for manual, "H" for hoist, and "C" for crank. Where shutters are placed on one side of the wall and operated from the opposite side by a chain hoist, the letters "TW" are used. The numbers refer to the particular classification and use for which the door is designed.

Wrigley Building, 35th Street and Ashland Avenue, Chicago, Ill.

Shipping room openings enclosed by 11 rolling doors, 14 ft. 6 in. x 7 ft. 6 in., chain operated. Large doors of similar construction used on their garage on opposite side of Ashland Avenue



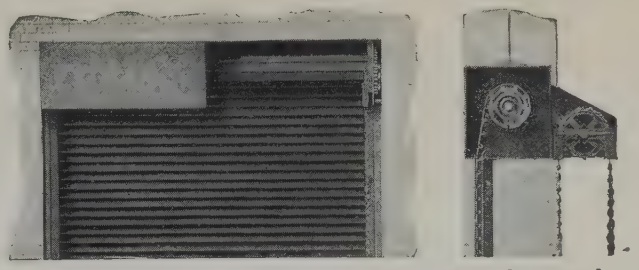
E. E. Atchinson Department Store, Minneapolis, Minn.

BERTRAND & CHAMBERLAIN, Architects

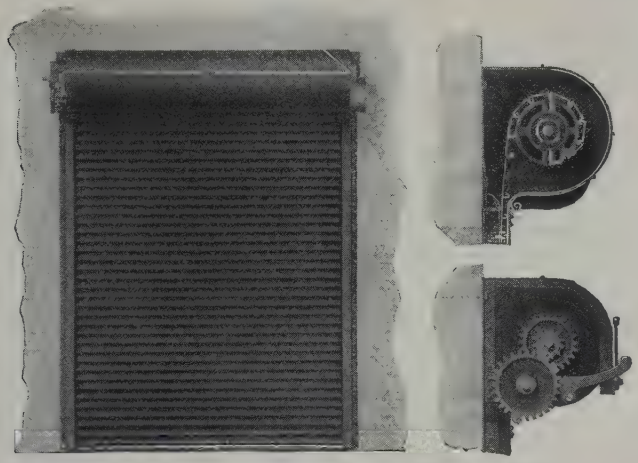
Eighteen rolling doors approximately 10x8 ft. placed on fire walls throughout this building. All doors manually operated, automatic, labeled and equipped with centrifugal governors

Continued on next page

No. 20 DH—Non-labeled, Chain Operated
No. 20 DM similar to above, except manually operated
No. 60 DH similar to No. 20 DH, except labeled
No. 60 DM similar to No. 20 DM, except labeled

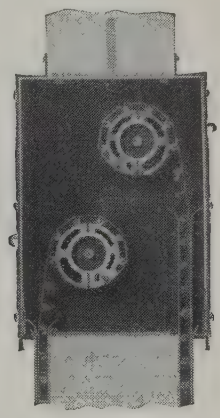


No. 41 UH—Non-labeled, Exterior, Chain Operated
No. 41 UM similar to above, except manually operated
No. 60 UH similar to No. 41 UH, except labeled
No. 60 UM similar to No. 41 UM, except labeled

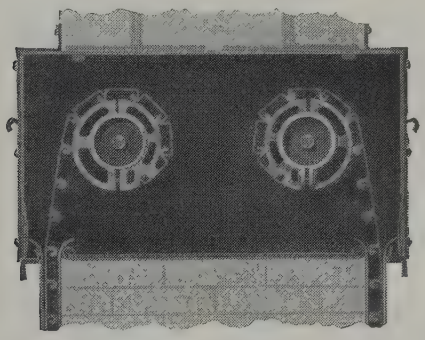


No. 33 DM—Labeled, Manually Operated, Automatic Closing
No. 33 DH similar to above, except chain operated
No. 61 DM similar to No. 33 DM, except used on exterior walls
No. 61 DH similar to No. 33 DH, except used on exterior walls
Nos. 33 and 61 DHTW similar, except shutter and hoist are on opposite sides

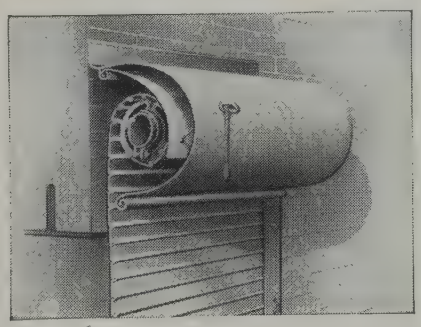
No. 33-33 DM—Labeled, Fire Wall, Manually Operated
Approved for doors on both sides of wall.
No. 33-33 DH similar, except chain operated



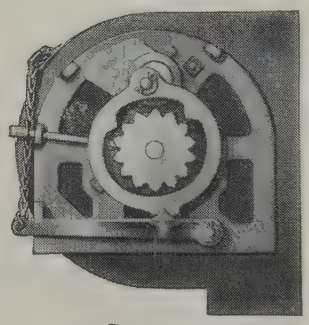
No. 33-3 UM—Labeled, Fire Wall, Manually Operated
Approved for doors on both sides of wall.
No. 33-3 UH similar, except chain operated



No. 33-3—Labeled, Fire Wall, Automatic Closing
Similar in construction to Type No. 33-33, except mounted under lintel only. In order to obtain full credit from the Underwriters where openings occur in fire walls it is necessary to protect each opening on each side of the wall



Baffle Plate
Hinged to outer hood and held in raised position. On fusing of link, baffle drops on coil, closing space between slats and wall and forming an effective flame stop



Governor
Escapement oscillating type out of engagement when door is operated normally either up or down; automatically engaged on fusing of link. A positive safety device

ALLEN & DREW, INC.

Specializing Entirely in Motor Operation of Doors and Gates

43-45 Brookford Street
CAMBRIDGE, MASS.
NEW YORK OFFICE, 50 Church Street

MOTOR OPERATION OF DOORS A SPECIALIZED ENGINEERING PROBLEM

Manufacturer of Electric Door Operator and Doors Only

Our entire plant is devoted exclusively to the manufacturing of motor driven units and apparatus for the operation of doors of all types, gates, theater curtains, gymnasium division, movable bleachers for gymnasiums, movable partitions, etc.

If architects so desire, we will also manufacture doors as well as the operator in order to make a complete installation.

Our doors are made to special details which we have found through years of experience will stand up best under constant use and abuse, or to architects' details if so desired.

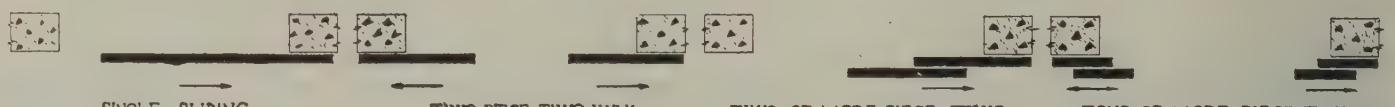
We always install our own apparatus whether we supply only the apparatus or both the door and apparatus.

Almost Every Door Presents a Different Problem of Operation and Mechanism

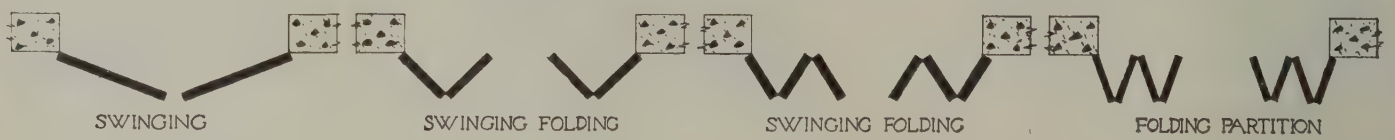
It is rarely that doors, even of the same character, in different installations can be operated in exactly the same manner. The way the doors are installed; the amount of headroom and space at the sides; the speed of operation desired; all help to determine the size of the motor and the general arrangement of the operating mechanism. The means of operating each door is therefore carefully considered and the best method of operation and the size of the unit is then determined.

TYPES OF DOORS WHICH OUR EQUIPMENT OPERATES

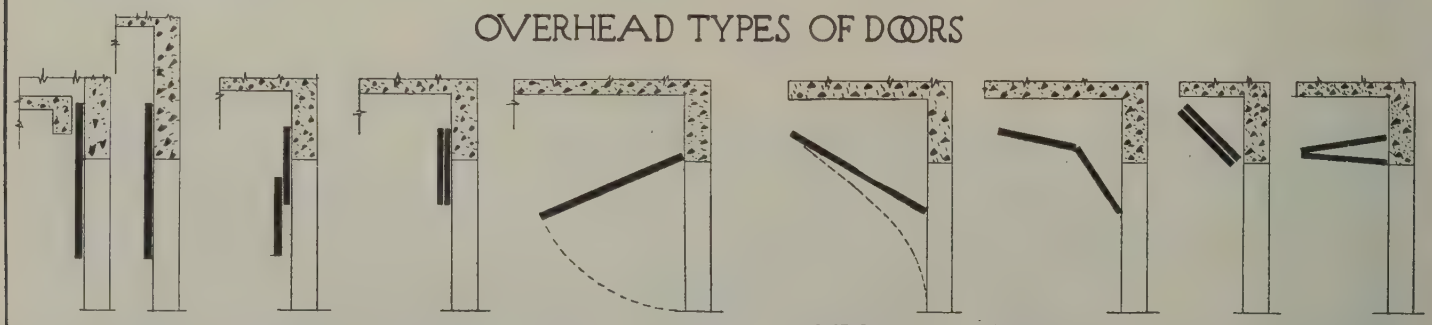
HORIZONTAL TYPES OF DOORS



VERTICAL FOLDING DOORS



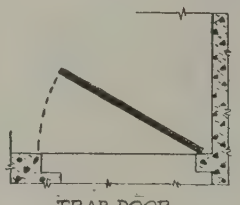
OVERHEAD TYPES OF DOORS



Types of Doors Recommended for Various Purposes

GARAGES—Sliding, swinging, vertical-sliding and swinging-folding types, see Allen & Drew Pages 3, 4, 5, 6 and 8.

WAREHOUSES, INDUSTRIAL PLANTS, PIER SHEDS—Turnover, and fold-up and canopy types, see Allen & Drew Pages 7 and 9.



AIRPLANE HANGARS—Larger sliding types, see Allen & Drew Page 4.

SCHOOL BUILDINGS—For dividing gymnasiums, etc., Vertical sliding types, see Allen & Drew, Page 11.

FIRE STATIONS—Two-way, two-speed sliding, also swinging types, see Allen & Drew Pages 4 and 8.

Continued on next page

ALLEN & DREW MOTOR DRIVEN UNITS

We Manufacture Six Sizes of Motor Units to Meet All Conditions

In order to fully cover the power requirements of every type of door we make six different sizes of machines. These have motors ranging from ¼ to 20 hp. Doors of practically any size and type can be operated by these machines. We are operating doors for openings 90 ft. wide and some weighing up to 15 tons.

The units are numbered from 100 to 600 as follows:

No. 100 powered by ¼ to ½ hp. motor.
No. 200 powered by ¾ to 1½ hp. motor.
No. 300 powered by 1½ to 3 hp. motor.
No. 400 powered by 3 to 7½ hp. motor.
No. 500 powered by 7½ to 12 hp. motor.
No. 600 powered by 12 to 20 hp. motor.

Guaranteed for One Year

Each machine is guaranteed for one year after installation. If anything wrong is discovered in the operation of the door due to a defective machine or through faulty installation during time of guarantee we will repair or put the machine in first class operating condition.

Quality and Cost

We endeavor to make the very best machine it is possible for us to produce both as to quality of materials, size of parts, as well as workmanship. Although the cost is thereby somewhat more than a cheaper made machine, it is amply repaid when perfect and constant operation and lack of repair bills are considered.

THE SPECIAL FEATURES OF THE ALLEN & DREW MOTOR DRIVEN UNITS

Worm Gear Drive Assures Safety

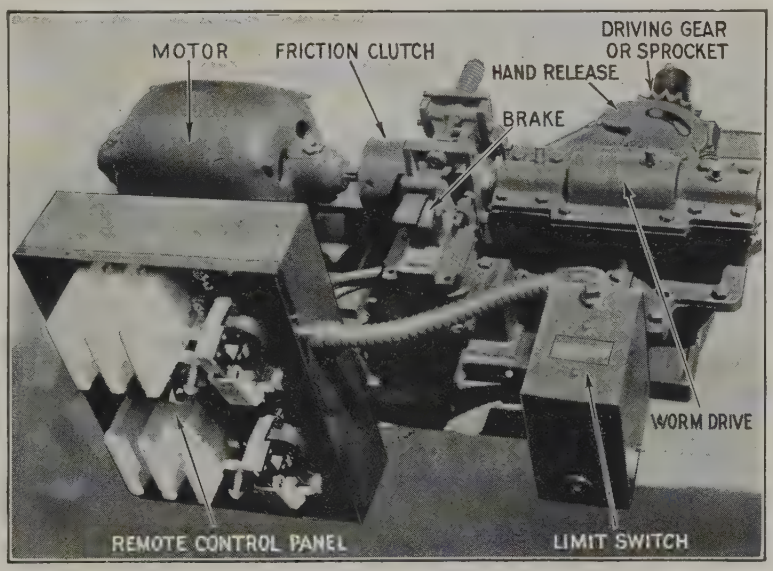
All our machines are of the worm type drive. By the use of the worm drive the load is always held and cannot release itself even though the magnetic brake be noneffective. The worm gears are of phosphor bronze and worms of hardened steel, the longest wearing worm drive construction possible.

The machines are all directly connected with the doors through the gears and there are no friction clutches or belts at this point to cause trouble and annoyance.

The overhead types of doors are counterweighted and include an equalizing shaft to which the door supports are attached and to which the worm gear drive is directly connected.

Importance of the Special Safety Friction Clutch

One of the most important and distinctive features of the units is the *safety friction clutch.* The motor is connected through the clutch to the worm shaft. The clutch is so adjusted that at a predetermined pressure, more than that required to operate the door, the clutch will slip and disconnect the machine as long as the pressure is applied. That is, if any obstruction, such as a person, were to press against the door as it was closing or opening, the added pressure would cause the disconnection of the motor through the clutch. This clutch can be accurately adjusted to operate under any pressure desired.



View Looking Down on One of the Units

The clutch consists of a seven-plate friction clutch of the oil type in which the pressure is applied by a hardened coil spring. This spring is adjusted accurately by an adjusting nut in order that the proper slippage may be obtained in starting the door from rest and in case of being obstructed. It will also pick up the load gradually and resume its normal operation after the obstruction has been removed.

Other Safety Features

The units are equipped with automatic stop, automatic brakes, and any other safety devices necessary, which may vary according to the type of door to be operated.

All the outfits may be released, usually by a convenient hand chain and then the door may be hand operated.

Electrical Equipment

All of our units are fully automatic in operation, involving no manual effort other than operating the push buttons. The operating of the doors will vary from 1 ft. per second to 3 ft. per second according to design and clearances.

The control is furnished either in remote control two-button momentary contact, the movement of the door stopping on releasing the button, or three-button maintain contact, the stop button for stopping the door at any point in its travel other than full open and full closed, these positions being controlled by the limit switches.

Each unit is fully equipped with limit switching devices, solenoid brakes and an emergency hand operator.

The control stations should always be in a position that will give the attendant an unobstructed view of the door opening and, if possible, for a considerable distance outside of the opening. This gives the attendant sufficient opportunity to reverse the action of the door in case he should be closing it in the path of an incoming automobile.

Automatic Electric Floor Trips

When so desired the doors can be operated automatically by the movement of motor vehicles entering or leaving the building. This is accomplished by our standard floor trip which will function when a car passes over it, opening the door and closing it when the car has passed over the trip on the other side of the building. For other than private garages we advise a special floor trip which will prevent the door from closing in the path of a following automobile.

These trips are so constructed that the lightest motor car will operate them but cannot be operated by pedestrians. The trips are watertight and will operate through snow or thin ice. The trips can be arranged to be disconnected by a switch inside the building when it is desired to use the push button control.

Signal Lights

In conjunction with the operation of the doors, it is desirable, especially where floor trips are used, to have signal light equipment for checking the operation of the doors and also warning the operators of the motor vehicles in order that they will not enter until the doors are fully open, otherwise damage may result to the door and car.

It is very desirable when overhead types of doors are used, the door opening to a position that is above the vision of the automobile operator, to use a "Stop and Go" signal operated automatically with the door controls, informing the operator of the automobile when the opening is clear for him to proceed.

SINGLE HORIZONTAL SLIDING DOORS

Notes Regarding Horizontal Sliding Door Operation

Special attention is called to the fact that the ordinary type of hanger used for sliding doors is entirely unsuitable for use with motor operated units. It will not stand up under constant usage. (See hangers recommended under Overhead Support Hardware below.)

Bottom Supported Door Hardware—Where it is possible to use it, we recommend the bottom supported type door. The weight of the door is carried on special roller bearing, malleable iron wheels placed at the bottom of the door and running on a track. This track is a specal heavy type which is concreted into the floor, eliminating all possibility of sag and binding. (See detail of track.) It is also especially useful where headroom is limited as shown in illustration.

Interior Showing Single Sliding Door with Bottom Support There Being Practically No Headroom

Overhead Supported Door Hardware—For this type of support we recommend the heaviest and easiest operation that can be purchased. Any extra cost will be made up by the saving in power and maintenance cost of hardware and operating equipment. Light track and hangers wear out quickly when doors are motor operated.

Pass or Wicket Doors—If desired to use a wicket door for use of pedestrians, wicket door should be interlocked with the electric drive equipment to prevent operation of the main door while wicket is open.

General Specification for Horizontal Sliding Doors

Scope—All one-piece horizontal sliding doors shall be operated by electric drive unit as manufactured and installed by Allen & Drew, Inc., Cambridge, Mass. Unit shall be controlled from push button stations as located on plans. Door shall operate at a speed of over 1 ft. per second.

Doors—Shall be made to special detail. (Here state size and thickness of door, stiles, rails, panels, material, glazing, wickets) as made by Allen & Drew, Inc. Joints shall be made with hardwood dowels and glued with waterproof glue. For size see detail drawings (or elevation).

Note: If doors are to be supplied in the millwork contract give full requirements for door construction under millwork.

Hardware—Shall be special extra heavy as manufactured by Allen & Drew, Inc. It shall be so constructed, that weight of the door is carried on roller bearing wheels at the bottom of the door and of the number required to properly operate and support the weight. Wheels shall be grooved to run on 12-lb. industrial track.

Note: State whether the roller bearings are to be concealed in a steel door or on the outside of wood doors.

Head Guide—Shall be built up of steel and be of proper size to guide door, and door shall have steel angle rubbing strip at top and two edges as detailed.

Floor Track—Shall be 12 lb. industrial rail with anchors for setting in concrete floor.

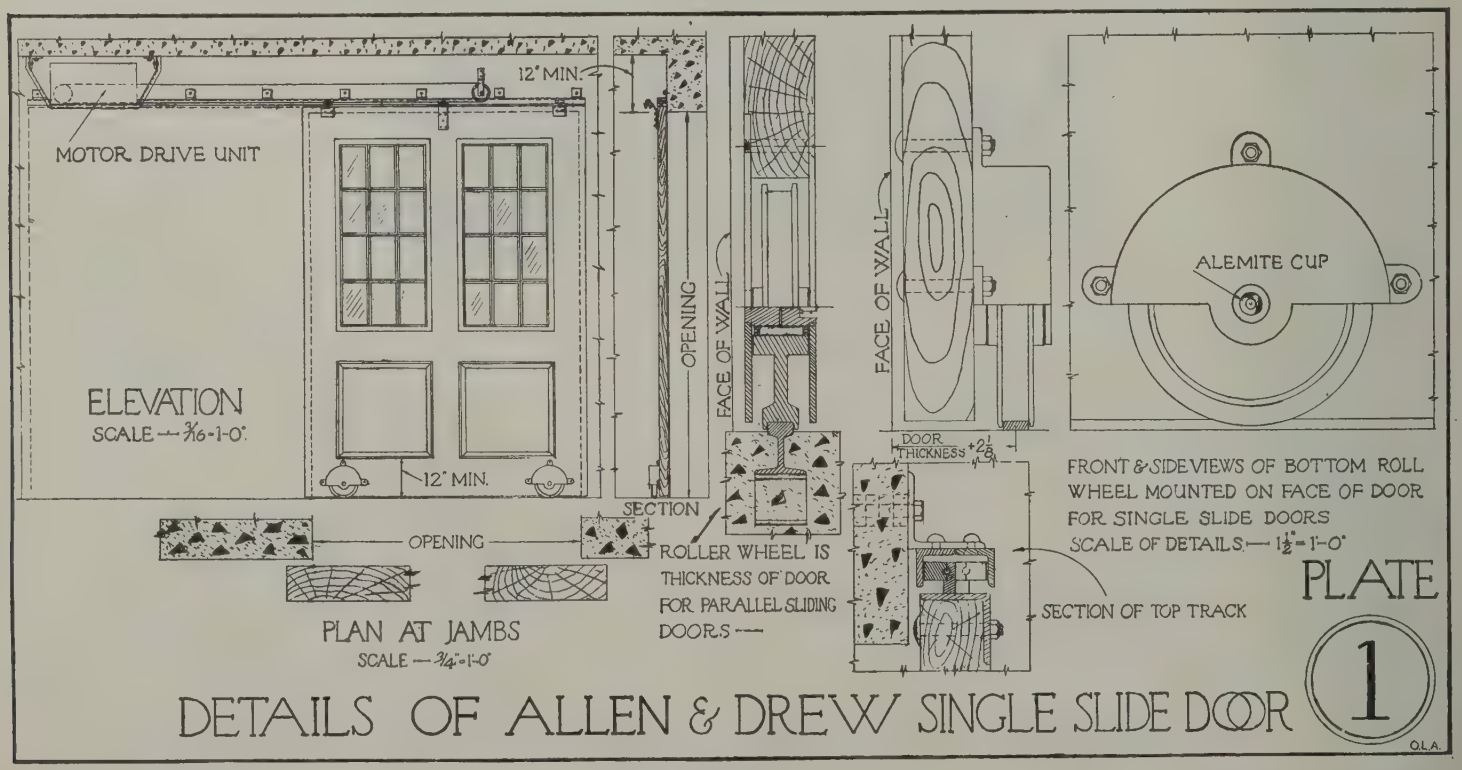
Track, and instructions for installing in floor by mason contractor, shall be supplied by Allen & Drew, Inc.

Motor Connection—The door shall be operated by endless chain, directly connected by sprocket with the driving unit. Chain drive shall be arranged for disconnection from door, allowing hand operation of door if current fails. All other mechanism necessary to make a complete installation such as idler, etc. shall be furnished and installed by Allen & Drew, Inc.

Motor Unit—Shall be a remote controlled unit, having specially wound high torque reversible motor with solenoid brake and shall include limit switches, as located on plan, which are actuated by worm screw directly connected with the motor drive. All parts are to have a factor of safety of six and the motor to be operated at 50% of its capacity under normal conditions.

Electric Control—Remote control panel shall be enclosed in a surface type steel box, and shall contain the switches, overload and under voltage relays, which shall protect the motor in the case of overload or an abnormal drop in voltage.

Guarantee—The complete installation shall be guaranteed and serviced by the manufacturer for the period of one year from time of completion.



Continued on next page

TWO OR MORE PIECE, ONE OR TWO-WAY, TWO OR MORE SPEED HORIZONTAL SLIDING DOORS

Notes Regarding the Above Types of Doors

The two or more piece door operating either one or two ways is very adaptable to the modern garage. It takes up less sideroom than the single door and the opening can be cleared more quickly. The same type of hardware is used as described on Plate 1 and gives a very rigid and substantial installation free from sagging and binding.

Door Hardware—For doors operating in tandem in one direction, the lower corners of the doors are equipped with steel plates carrying the roller bearing wheels in the thickness of the door. This requires a door 2⅝ in. thick minimum and with 12-in. bottom rail. The track is double the width of that for single sliding doors.

See description of hardware (Plate 1) for single sliding doors.

Speed of Doors—Doors of two-piece type sliding parallel are controlled so that one section will move at double the speed of that section nearest the opening jamb.

Two-piece, Two-speed, One-way Horizontal Sliding Door

General Specification Notes

For Two-piece, Two-speed, One-way Horizontal Sliding Door—Doors shall be so controlled that one section shall move at double the speed of that section nearest the opening jamb. Doors are to be controlled from push button station and the slow door to move at better speed than 1 ft. per second.

For Two-piece, Two-way Sliding Type Door—Doors shall be so controlled that the two sections shall part at the center and each operate in an opposite direction.

Note: The hardware is similar to that for the single door except that two sets of roller bearing wheels or two sets of hangers are required.

Four-piece, Two-way, Two-speed Sliding Type Door—Doors shall be so controlled that the two center sections shall part at the center and each side pair shall operate at a two-speed operation. The two middle sections shall operate at double the speed of the two jamb side sections.

Doors—See specification on Plate 1.

Hardware—Similar to specification on Plate 1, except that the number of roller bearing wheels or hangers will be increased as well as one or two tracks shall be used.

Head Guide—See specification Plate 1.

Floor Track—See specification Plate 1. Provide for extra track when doors are parallel.

Motor Connection—See specification Plate 1. Add method of operation whether two-speed, or in opposite direction, etc.

Motor Unit—See specification Plate 1.

Electric Control—See specification Plate 1.

Guarantee—See specification Plate 1.

Continued on next page

ONE-PIECE VERTICAL SLIDING DOOR

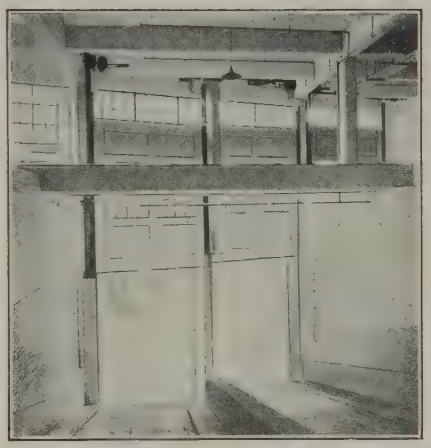
Notes Regarding One-piece Vertical Sliding Doors for Piers, Warehouses, Garages, etc.

This type of door is constructed in one section. It takes up very little space in the building but requires clearance above the door equal to the height of the door plus 1 ft. 10 in. In cases where the story height is not sufficient to allow this clearance, and if the building is more than one story in height, the second floor may be slotted, if the structural design permits, and the door operated through the slot. An automatic fire stop shuts off the slot when door is closed. The operating mechanism is then located on the underside of the third floor or roof. We have doors of this type covering very large openings and running into tons in weight.

Vertical Sliding Door

How Door Is Supported—The door is supported and operated from an equalizing shaft to which it is connected by two cables or two chains. Counterweights equal to the weight of the door are also supported from this shaft. The shaft is directly connected by gears to the worm gear drive. By this means the door is safely supported at all times even if the counterweights be released. The counterweights may be either simple or compound according to the story height, in order that the counterweight will operate in a single story height.

The shaft is supported by hangers having self-aligning roller bearings, which distribute the load of the doors and counterweights equally on the masonry across the width of the door opening.



Vertical Sliding Doors Passing into Second Story

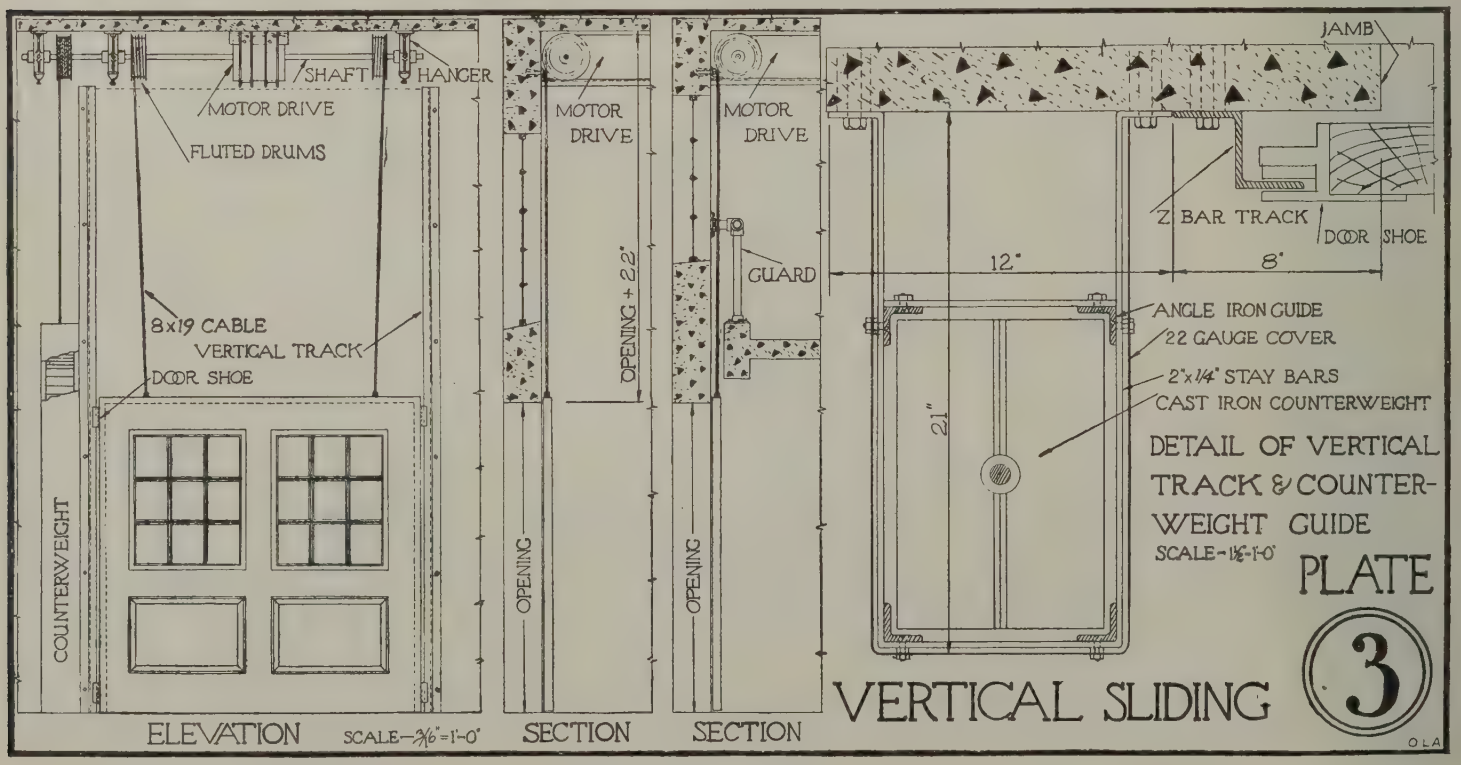
General Specification for One-piece Vertical Sliding Doors

Scope—All one-piece vertical sliding doors shall be operated by electric drive unit as manufactured and installed by Allen & Drew, Inc., Cambridge, Mass. The units shall be remote controlled from push button stations as located on plans. Doors shall operate at a speed of approximately 2 ft. per second.

Doors—See specification Plate 1. Flexible rubber tubing shall be secured on bottom of the door to take up any unequalities and make tight joint.

Tracks—Shall be placed at sides of openings to guide the door throughout its full travel. Roller guides to fit the track shall be installed on doors.

Equalizing Shaft and Motor Connection—Each door shall be supported on an equalizing shaft to which the supporting cable or chain, at each end of the door, shall be attached. Doors shall be evenly counterbalanced by weights running either at one side or both as required. Counterweights shall be guided in light iron guides completely enclosed in sheet metal box. There shall be at least three shaft hangers with self-aligning bearings to each door to distribute load on shaft.



Continued on next page

TWO-PIECE, TWO-SPEED VERTICAL SLIDING DOORS

Notes Regarding Two-piece, Two-speed Vertical Sliding Doors for Garages, Warehouses, etc.

This type of door is for uses similar to the single vertical sliding door. It has the advantage of using only half the headroom required by the single door. The door is made in two sections of equal height which slide vertically and require one-half the height of the opening plus 1 ft. 6 in. minimum.

One of the important advantages this type has is the speed at which the door can be opened, approximately 2 ft. per second.

How the Doors Are Supported—Both sections of the doors are attached to an equalizing shaft by cables or chains, each part being supported by two chains or two cables. Each section is counterbalanced so that the weight is evenly carried at all times on the equalizing shaft to which the counterbalances are also attached.

A Special Construction Showing Interior of a Double Two-piece, Two-speed Vertical Sliding Door without Dividing Mullion

The motor driven unit is a worm drive machine directly connected with the equalizing shaft, and the door sections cannot drop even though the counterweight be released. The equalizing shaft is also hung in the same manner as for the single vertical type door.

General Specification for Two-piece, Two-speed Vertical Sliding Doors

Scope—All two-piece, two-speed vertical sliding doors shall be operated by electric drive unit as manufactured and installed by Allen & Drew, Inc., Cambridge, Mass. The units shall be remote controlled from push button stations as located on plans. Lower section of door shall travel at the rate of approximately 2 ft. per second or double the speed of the upper section.

Door — See specification Plate No. 1. Flexible rubber tubing shall be secured to bottom of the door to take up any unequalities and make it tight.

Tracks — Double steel tracks shall be placed at sides of opening to guide the door section throughout their full travel. Roller guides to fit the track shall be installed on the door.

Equalizing Shaft and Motor Connection—Each section of the door shall be supported on an equalizing shaft to which the supporting cable or chain, at each end of the door sections, shall be attached. Door sections shall be evenly counterbalanced by weight running either at one side or both as required. Counterweights shall be guided in light iron guides completely enclosed in sheet metal box.

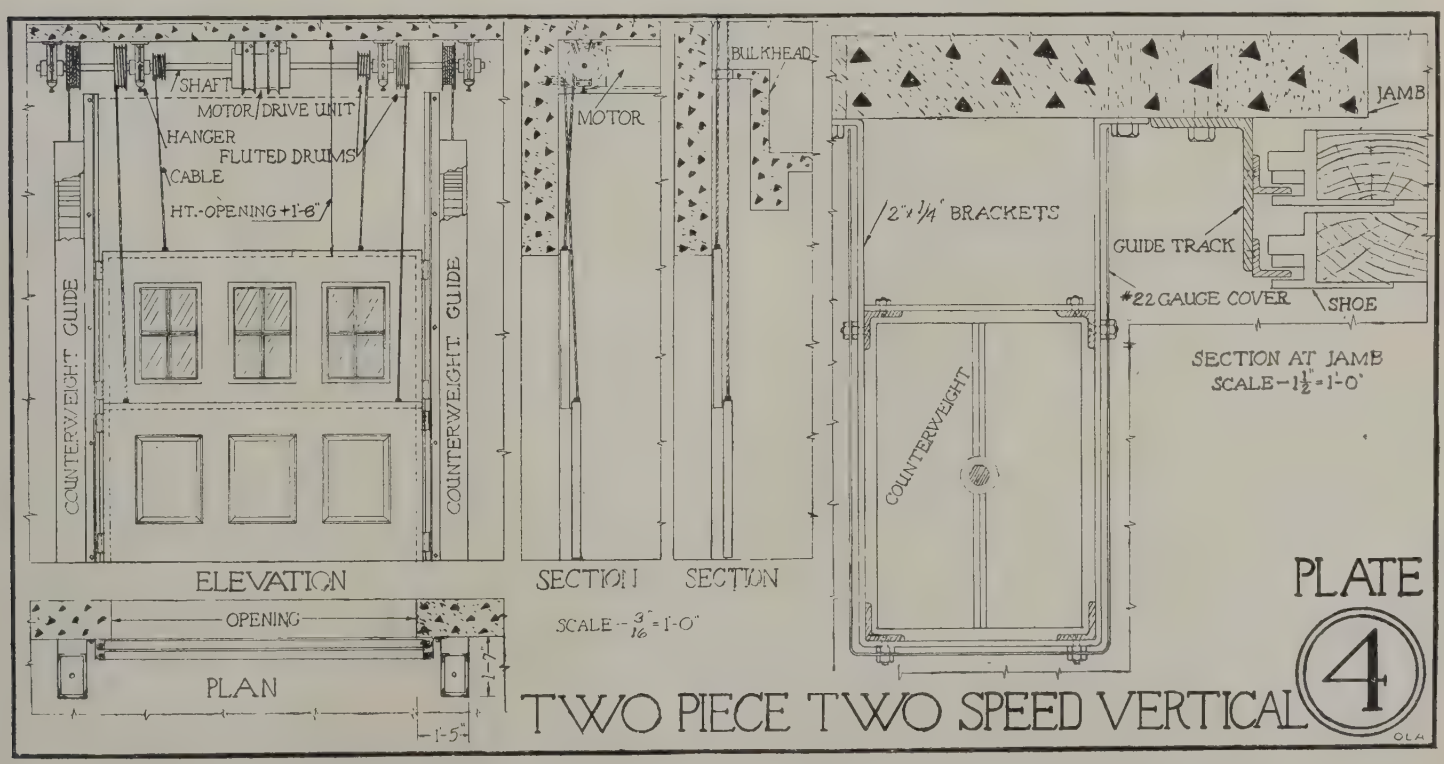
There shall be at least three shaft hangers with self-aligning bearings to each equalizing shaft to distribute the load on the shaft.

Shaft shall be directly connected to the operating unit and so arranged that the electric machine may be released and the door hand operated when required.

Motor Unit—See specification Plate No. 1.

Electric Control—See specification Plate No. 1.

Guarantee—See specification Plate No. 1.

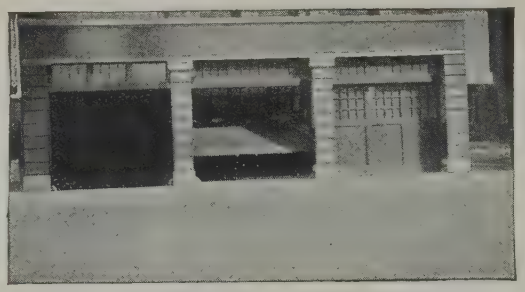


Continued on next page

FOLD-UP AND CANOPY DOORS

Notes Regarding Fold-up and Canopy Doors for Garages, Warehouses, etc.

This type of door is of use where there is little headroom above the door opening. It occupies very little sideroom and when open the door is entirely out of the way. They are made in two horizontal sections which fold up horizontally instead of sliding vertically as the two-piece vertical sliding doors do. Both sections are on the same plane and hinged together at the horizontal joint. The door is counterbalanced to add to the ease of operation. We have doors in operation 10 to 27 ft. wide and height varying from 9 to 15 ft.



Exterior View Showing Fold-up Doors in Three Stages of Operation

The canopy door operates just the opposite from the fold-up door. The canopy doors as they are opened, project outward and not inward as the fold-up doors do. As they open out they form a canopy or shelter over the door opening. This is useful in warehouses or shipping platforms where trucks or wagons are loaded from platform.

Interior Showing Condition Where Operating Unit Is Located on Floor Above on Account of Lack of Headroom

The doors may be made of any material or of any design desired to carry out an architectural scheme.

The driving equipment may be placed on an upper floor if the design is such that clearances are slight over the head of the opening.

General Specification for Fold-up and Canopy Doors

Scope—All fold-up and canopy doors shall be operated by electric drive unit as manufactured and installed by Allen & Drew, Inc., Cambridge, Mass. The units shall be remote controlled from push button station as located on plans. Door shall operate at a speed of [1] [2] ft. per second.

Fold-up Doors—All fold-up doors shall operate to fold inward and upward toward the ceiling.

The doors shall be made in two flush horizontal sections hinged in the middle and shall operate at a speed of at least 1 ft. per second in both opening and closing.

Canopy Doors—(Same as for fold-up, except open outwards.)

Door Construction—See specification Plate No. 1.

Tracks—Steel tracks shall be placed each side of the opening to act as a guide for the roller wheels on the bottom of lower panel.

Equalizing Shaft and Motor Connection—The door shall be lifted by means of a cable or chain attached to the roll wheel shaft at the bottom of the lower section and to an overhead equalizing shaft. This shaft shall be directly connected with the counterweight and electric driving unit. Counterweight shall be guided in light iron guides completely enclosed in sheet metal box.

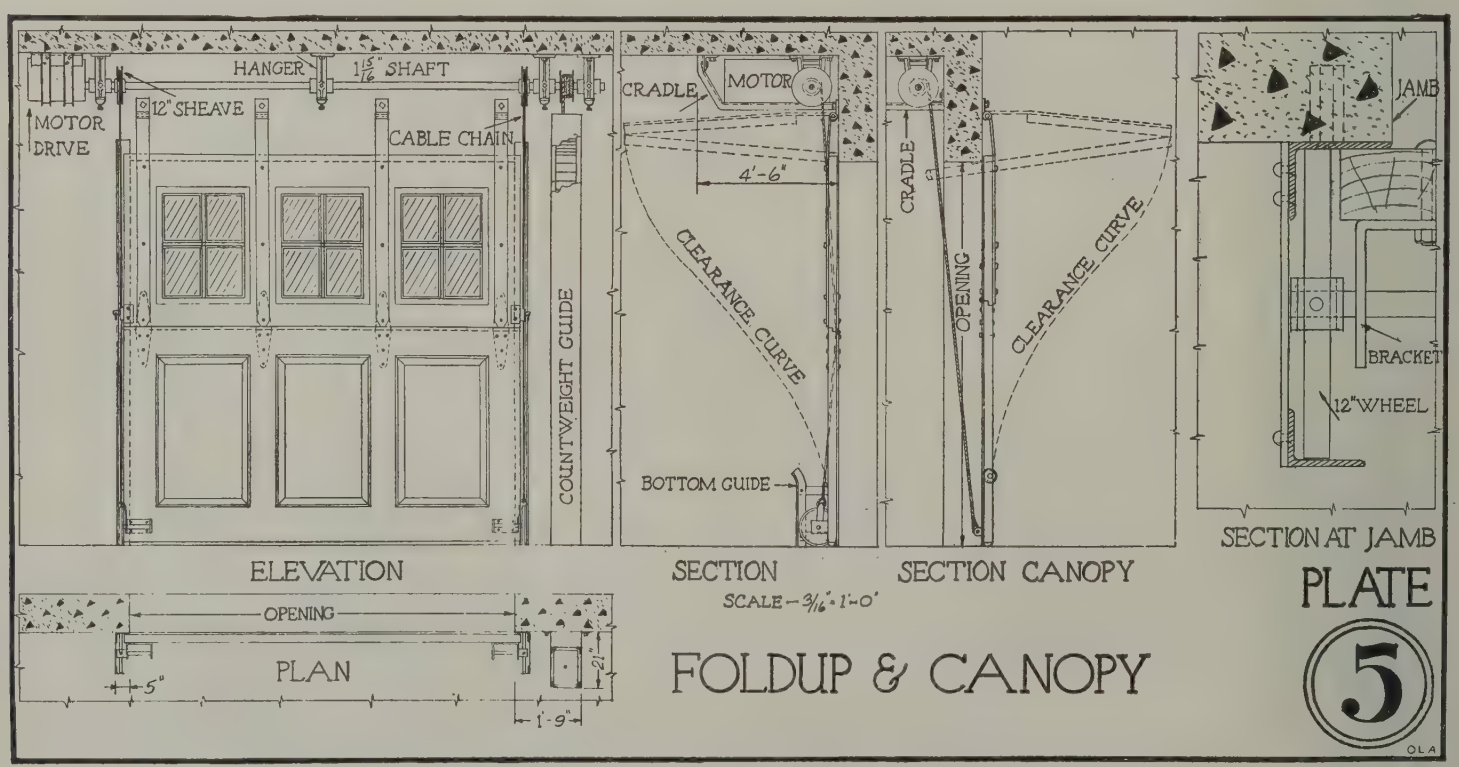
There shall be at least three shaft hangers with self-aligning bearings to each equalizing shaft to distribute the load on the shaft and its support.

Shaft shall be directly connected to the operating unit and so arranged that the electric machine may be released and the door hand operated when required.

Motor Unit—See specification Plate No. 1.

Electric Control—See specification Plate No. 1.

Guarantee—See specification Plate No. 1.



Continued on next page

TWO AND FOUR-PIECE SWING DOORS

Notes Regarding Two and Four-piece Swing Doors

This type of door has fulfilled a service where it was not desirable to use other types of doors. The pair of single swinging doors open either inward or outward at each side of the opening. The doors are hinged with heavy strap hinges which are in turn operated by heavy steel shafts placed in a vertical position at each side of the door opening. The entire mechanism requires only 8 in. at each side of the opening and 1 ft. 6 in. above the opening. Doors may be arranged to swing at different angles if required, as at 90° for one and 180° for the other. The doors operate very rapidly and on account of the manner in which they are hung they are prevented from sagging.

The four-piece swing doors are a combination of the hinged swinging door and the overhead trolley type. The jamb section swing and the middle section slide and swing being hinged to the jamb section and the inside upper corner hung from an overhead track.

Four-piece Swinging Folding Door

General Specification for Two-piece Swing Doors

This hardware should be used on doors of over 165 sq. ft. of opening. Hardware for operating doors of 165 sq. ft. and under, special design heavy strap hinges shall be furnished for each door and shall be rigidly connected with vertical shafts placed at each side of the door opening. Each shaft shall turn in and be supported by substantial brackets at both sides and the upper end connected by means of cranks and tubular steel arms to an Allen & Drew motor unit of the crank drive type. (Details shown on cut below.)

Scope—All [two-piece swing] [4-piece swing] doors as noted on drawings shall be operated by one electric drive unit, for each set of doors, as manufactured and installed by Allen & Drew, Inc., Cambridge, Mass. Each unit shall be remotely controlled from push button station as located on plans. Door shall operate at a speed of 2 ft. per second.

Door Construction—See specification Plate 1.

Hardware — Special design extra heavy strap hinges shall be furnished for each door (number depends on size and design of doors), and shall be rigidly connected with vertical shafts placed at each side of the door opening. These shafts shall turn in and be supported by substantial brackets at both sides and the upper end connected with horizontal equalizing shaft through a bevel gear box.

The motor drive unit shall be directly connected with the equalizing shaft and so arranged that the electric machine may be released and the doors hand operated in case of failure of the electric current. All parts shall have a factor of safety of six and the motor operate at 50% of the rating.

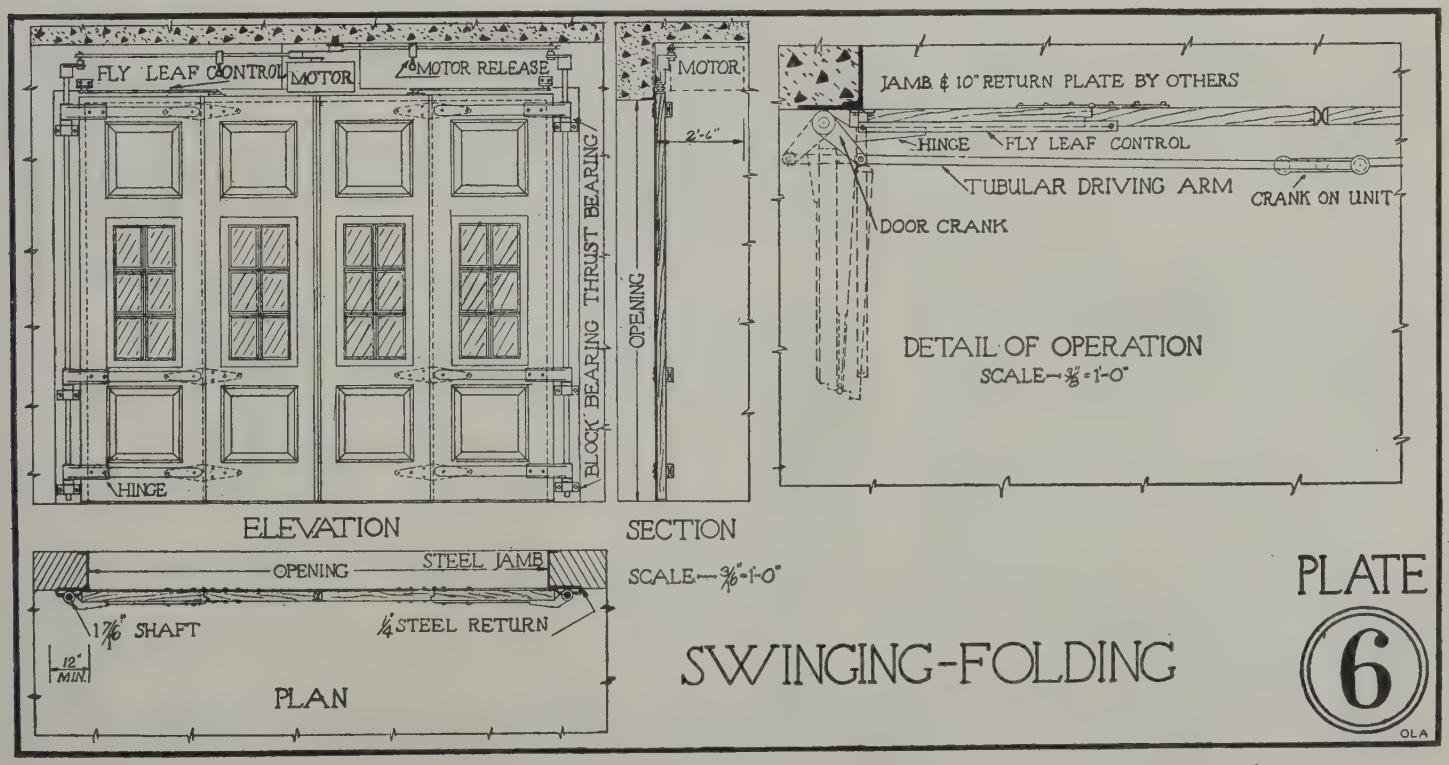
Hardware for Four-piece Swing Type—(In addition to the hardware required for the two-piece unit add as follows.)

The two middle sections shall be hinged to the jamb sections and in addition shall be guided at the outer upper corner on a special overhead swivel hanger and track as made by Allen & Drew, Inc., Cambridge, Mass., or by substantial guides of other makes.

Motor Unit—See specification Plate 1.

Electric Control—See specification Plate 1.

Guarantee—See specification Plate 1.



Continued on next page

ONE AND TWO-PIECE SLIDE-UP TURNOVER DOORS

Notes Regarding One and Two-piece Slide-up Turnover Doors for Warehouses, Industrial Plants and Pier Sheds

This type of door is valuable when it is necessary to conserve floor space and it requires little headroom. It is made of one or two sections according to the clearance required about the opening. The two-section type occupies less space, as a turnover, than the one-piece type.

The doors, either in one or two sections, slide vertically and horizontally at the same time and assume a horizontal position against the ceiling.

The doors are counterbalanced and can be operated at a speed of about 1½ ft. per second, depending on the size of the door. The design of the side and overhead track vary with the size, weight and speed of the door.

Two-piece Slide-up Turnover Doors in Three Positions

How the Doors Are Supported — The lower section of the door is directly connected to an equalizing shaft by cable or chain on each side of the door. The counterweight for the door is also connected to the equalizing shaft. The shaft in turn is directly connected to the electric operator, but so arranged that it may be released and the door operated by hand in case of failure of the electric current.

General Specification for Slide-up Turnover Doors

Scope—Doors of the slide-up turnover type (one or two sections) shall be manufactured by Allen & Drew, Inc., Cambridge, Mass., and shall be so constructed that they will slide vertically and horizontally to a turned over position above the opening. The units shall be remote controlled from push button stations as located on the plans. Doors shall operate at a speed of approximately 1½ ft. per second both opening and closing.

Doors shall be made in [one] [two] horizontal flush section[s], hinged in the middle.

Door Construction—See specification Plate 1.

Tracks—Steel tracks shall be placed at each side of the door and also in a partially horizontal position over the opening to guide the door section[s] to a full open position. Each door section is held in place by steel rollers running in the tracks.

Equalizing Shaft and Motor Connection—The doors shall be lifted by means of a cable or chain attached to the roller or wheel shaft at the bottom of the lower door section and to an overhead equalizing shaft. This shaft shall be directly connected with the counterweight and electric driving unit. Counterweight shall be guided in light iron guides completely enclosed in sheet metal box.

There shall be at least three shaft hangers with self-aligning bearings to each equalizing shaft to distribute the load on the shaft and its supports.

Shaft shall be directly connected to the operating unit and so arranged that the electric machine may be released and the doors hand operated when required.

Motor Unit—See specification Plate 1.

Electric Control—See specification Plate 1.

Guarantee—See specification Plate 1.

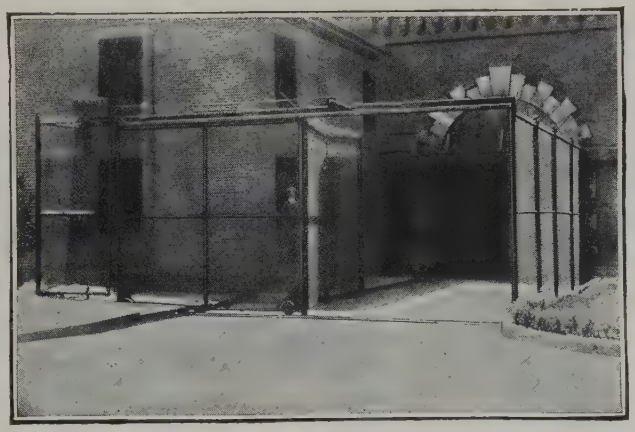
ELECTRICALLY OPERATED GATES

Gates for Jails

On this page we show an illustration of an installation made in a modern jail building, there being two gates which form a box in order that there may always be one gate closed while a vehicle is entering or leaving the grounds. Both equipments are installed on the exterior and housed against the action of the elements.

Both gates are operated from the gate house by one man who also checks the vehicles as they enter or leave. It took three men to operate the gates and check the vehicles previous to our making this installation. The outside gate is constructed of solid steel plate and weighs about 2 tons.

We have a large number of installations of gates in jails in various parts of the country.



Two Electrically Operated Sliding Gates at Suffolk County Jail, Massachusetts

A list of installations and references will gladly be sent on request.

Gates for Industrial Plants

One of the important uses for motor operated gates is in large industrial plants. The gates may be made either sliding or hinged. The remote control devices allow the guard to operate the gates without having to go outside the gate house.

Gates on Estates

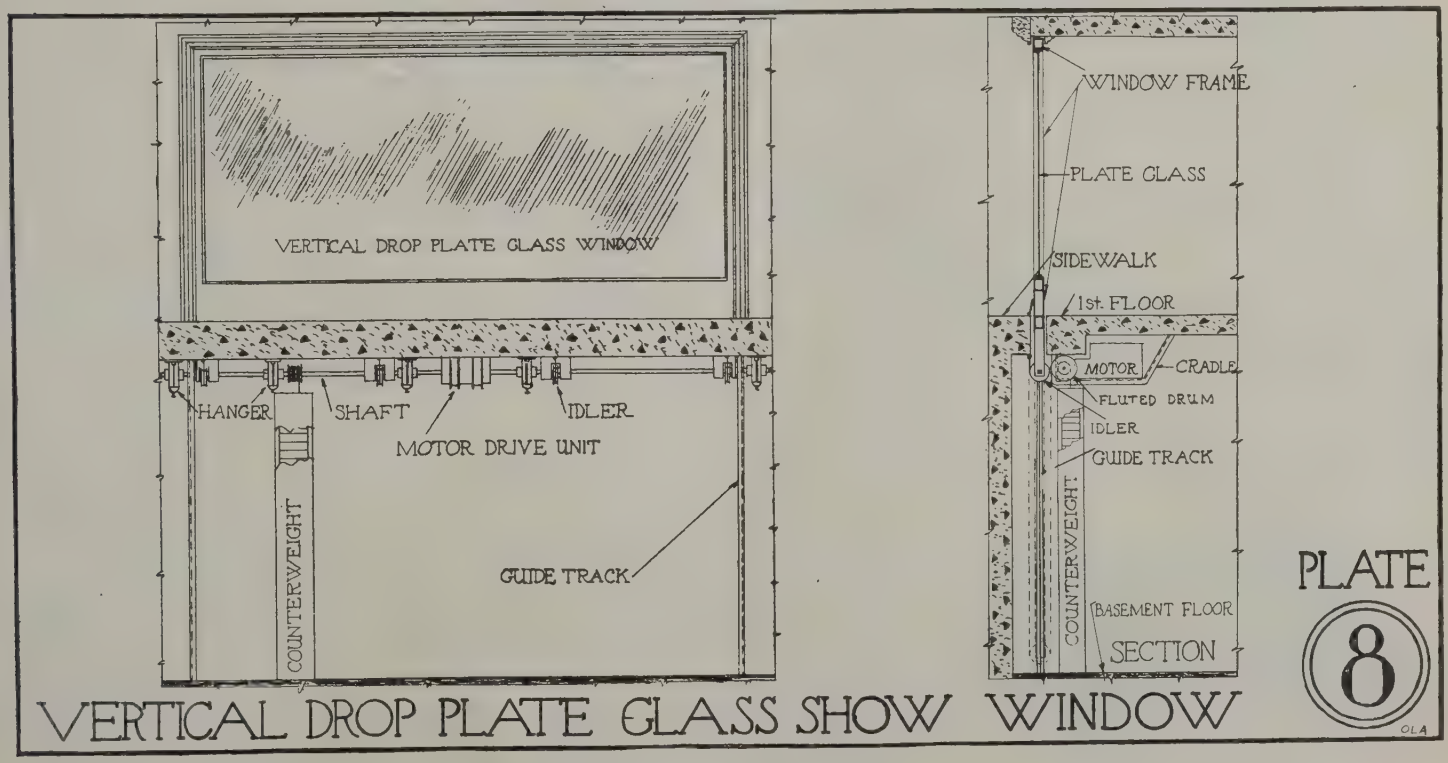
For large estates where the utmost privacy is desired by the owner, double gates are often used on the service entrance similar to the jail gates and they may be operated in a similar manner. For main entrance gates of wrought iron or bronze our equipment can be designed to operate gates of any size.

SPECIAL VERTICAL DISAPPEARING PLATE GLASS SHOW WINDOWS

It is sometimes desirable, in the case of large department stores, to take advantage of a space used during business hours as a lobby, for show purposes after hours. This presents intricate problems to take care of the disappearance of the show window during business hours. We illustrate in the accompanying detail one type of installation which we have made for automobile showrooms.

The windows can be arranged to slide either overhead or down into a basement. This type of installation is very desirable in showrooms when bulky articles are shown, such as automobiles, boats, etc.

There are no standard specifications for this type of installation due to the variety of ways the window may be made to disappear. Each installation is built to suit the conditions.



Continued on next page

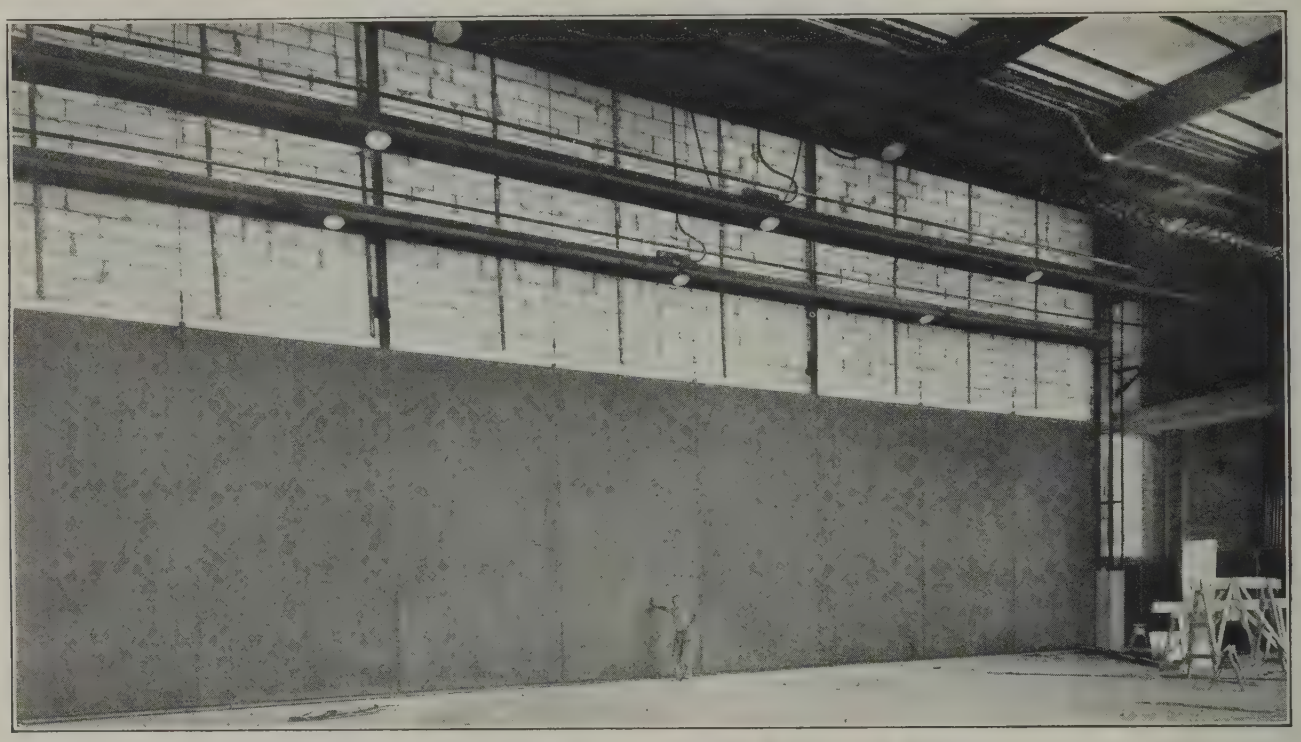
VERTICAL SLIDING PARTITIONS FOR ALL SERVICES AS THEATER CURTAINS AND GYMNASIUM DIVISIONS

The Allen & Drew Vertical Sliding Partition is built of a properly constructed channel frame covered on both sides with sheet metal, the hollow space being filled with fireproof sound retarding material. The size of the channel framing and gauge of sheet metal varies according to the use to which the "partition or curtain" will be put.

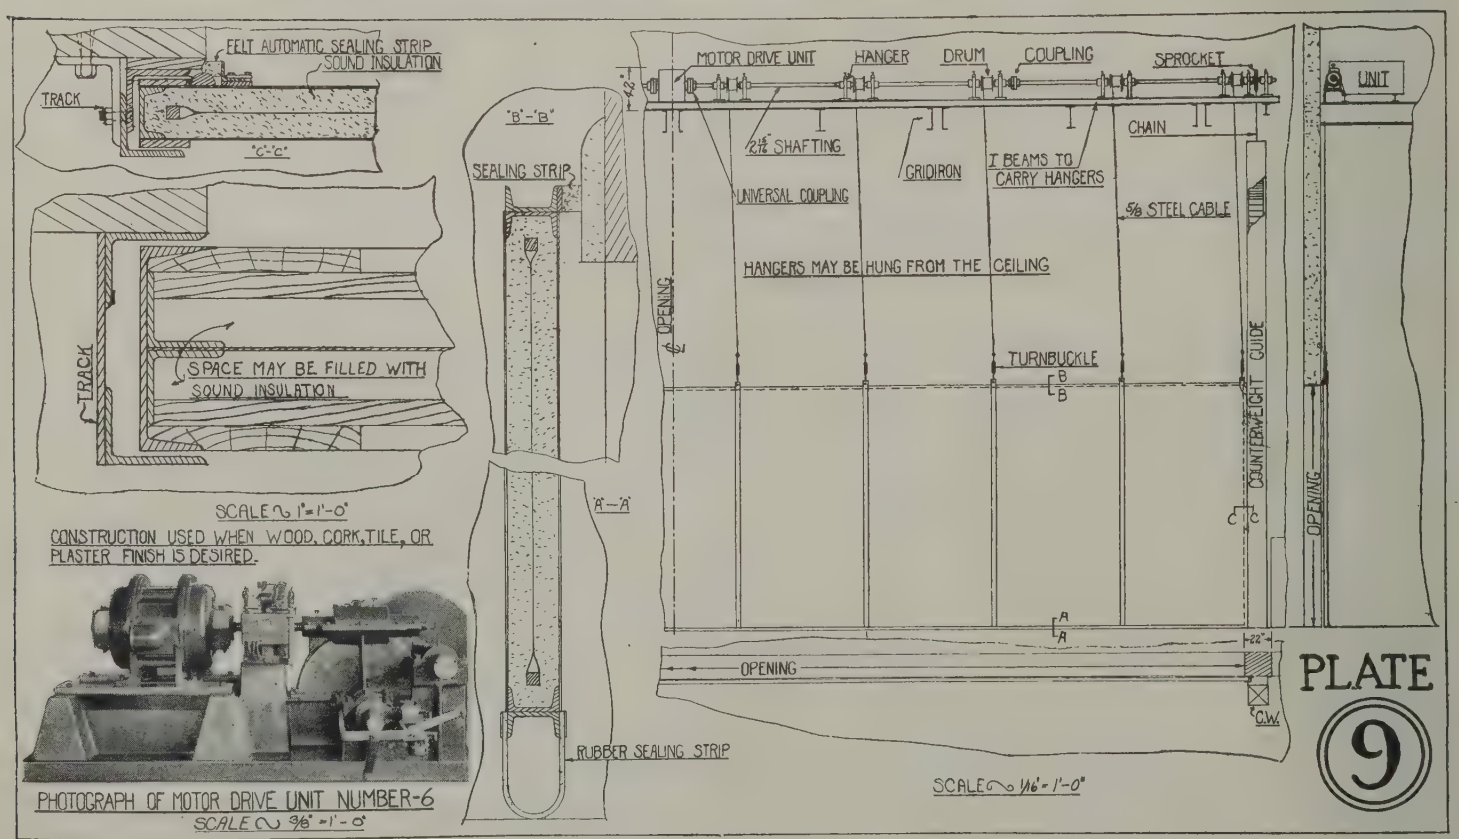
The Allen & Drew partition has fixed guides at each end and several telescoping guides at intermediate points. The bottom of the partition is equipped with dowel pins to lock it to the floor.

The partition is lifted by cables or chains attached to the top. It is raised by means of an overhead equalizing shaft extending the entire width of the opening. A motor drive unit is directly connected to this shaft, making it impossible for the partition to move without releasing the electric brake and rotating the worm.

Estimates and Service—All installations of this nature present problems requiring individual attention. We shall be pleased to receive sketches for any proposed use of curtains or partitions of this type and will gladly furnish detailed drawings, specifications and formal quotations for the complete installation of this equipment in any part of the United States.



Partition Installation on Opening 90 Ft. Wide by 19 Ft. High



AUTOMATIC DOOR & EQUIPMENT COMPANY

Manufacturers of Vehicle Entrance Equipment

664 North Michigan Avenue

CHICAGO, ILL.

REPRESENTATIVES IN PRINCIPAL CITIES

Products

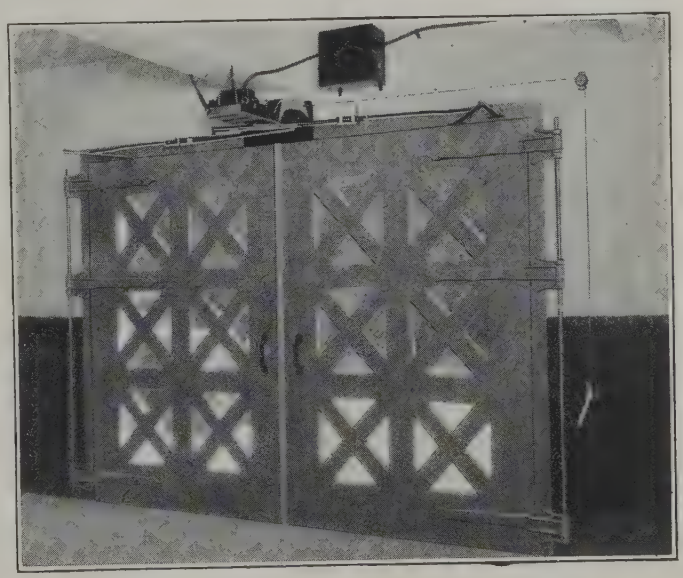
ELECTRIC DOOR OPERATORS
TIME CLOSING DEVICES
FLOOR TRIP SWITCHES
MALLEABLE IRON, BALL BEARING, OFFSET, ADJUSTABLE HARDWARE
METAL and METAL COVERED DOORS
THREE-PLY TWISTPROOF WOOD DOORS
STEEL DOOR FRAMES
WOOD DOOR FRAMES

Services

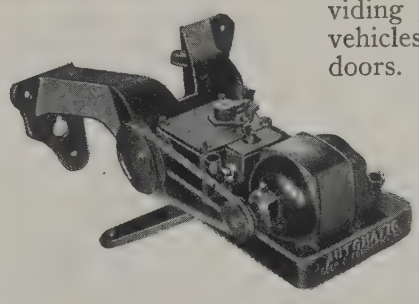
The AUTOMATIC DOOR & EQUIPMENT COMPANY manufactures entrance equipment and, when so contracted, will install entrances complete. Although a complete entrance installation is recommended, any AUTOMATIC DOOR & EQUIPMENT COMPANY product may be purchased and installed independently.

Electric Door Operators

AUTOMATIC DOOR & EQUIPMENT COMPANY electric door operators are manufactured in two styles—one for swinging or folding doors and another for sliding doors. The mechanism of these operators is extremely simple and practical. Doors are opened and closed by a single oscillating arm propelled by a heavy-duty reversible motor. The power reduction is through a sturdy ball-bearing double worm-gear reducer. The gear mechanism is enclosed in a non-leaking housing filled with heavy oil. Due to the circular motion in which the operating arm travels, doors open and close quickly without straining, "whipping" or slamming.



Above
Operator Installed on Double Swing Garage Doors



Right
View of Operator Showing Compact Rugged Construction

Thermostatic Protection

When the action of the doors is checked by any obstruction, a thermostatic cut-out shuts off the power, preventing blowing of fuses and injury to the mechanism.

Releasing Clutch

A conveniently located lever disengages the operating mechanism permitting manual operation of doors. Clutch may be re-engaged with doors in any position.

Remote Control

Positive control of doors is maintained at all times as the "momentary contact" type of switch is employed. Doors may be started, stopped or reversed at any point by a single impulse through conveniently located buttons or pull cords. If the switch is operated while the doors are in motion, action stops immediately. Doors reverse their direction when the switch is operated again.

Automatic floor trip switches, "Key Box" switches and time closing devices may be had when desired.

Hardware

AUTOMATIC DOOR & EQUIPMENT COMPANY entrance hardware for swinging, folding or sliding doors is striking in design and more than adequate in strength. All castings are of highest grade malleable iron. All hinges are of malleable iron and are mounted on thrust ball bearings. Hinges have adjustable side hinge plates and continuous pintels running from top to bottom. Because of the "offset" feature, doors swing completely out of the entrance thus providing greater clearance for vehicles and protecting the doors.

Doors

Wood Doors—These doors are constructed of selected white pine, three-ply, glued. They are shaped for rubber astragals at the meeting edges and are rabbeted at the folds.

Furnished in four-fold, double swing or sliding types.

Metal Covered Doors—All types of metal and metal covered doors can be furnished when specified.

Steel Door Frames

Steel door frames can be supplied in the following types: channels, angles, channel and plate or angle and plate. Equipment is designed to be mounted on the inside flange or leg of frame.

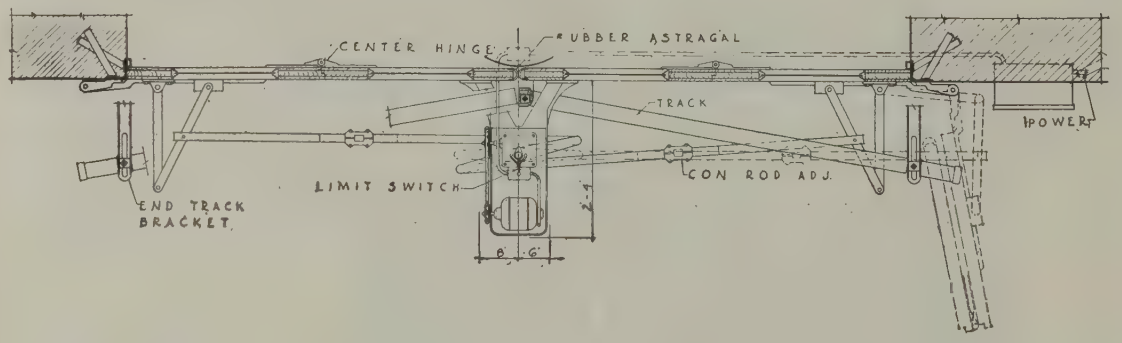
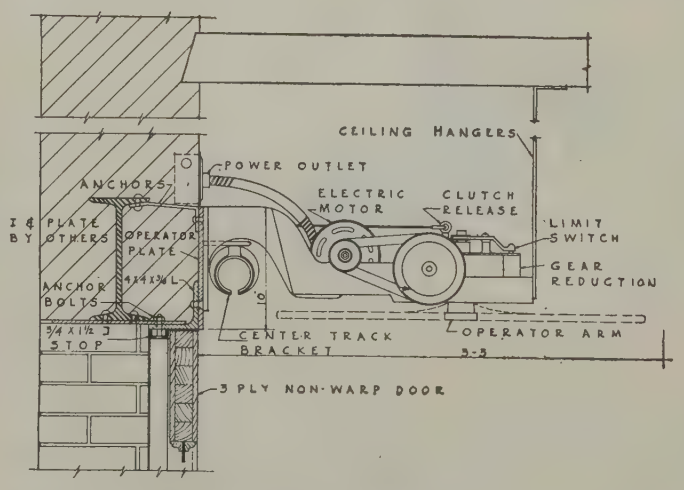
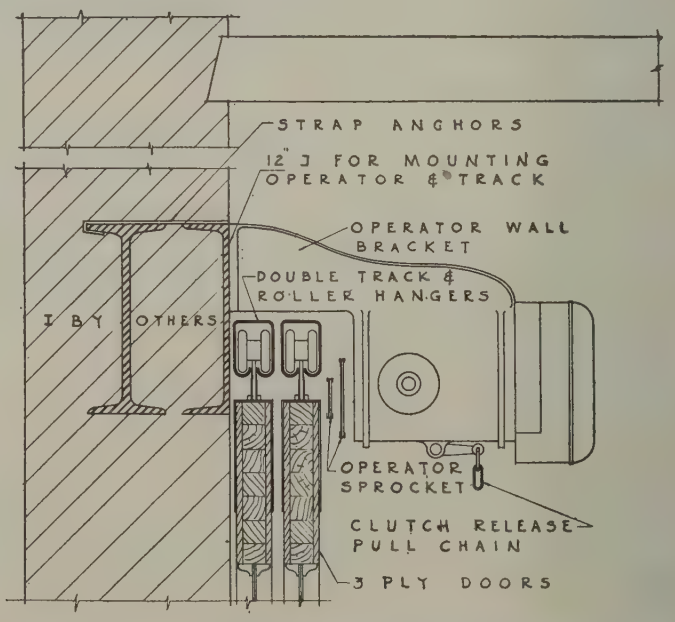
Automatic Electric Door Operator and Hardware Installed on Four-fold Doors

See specifications on following page



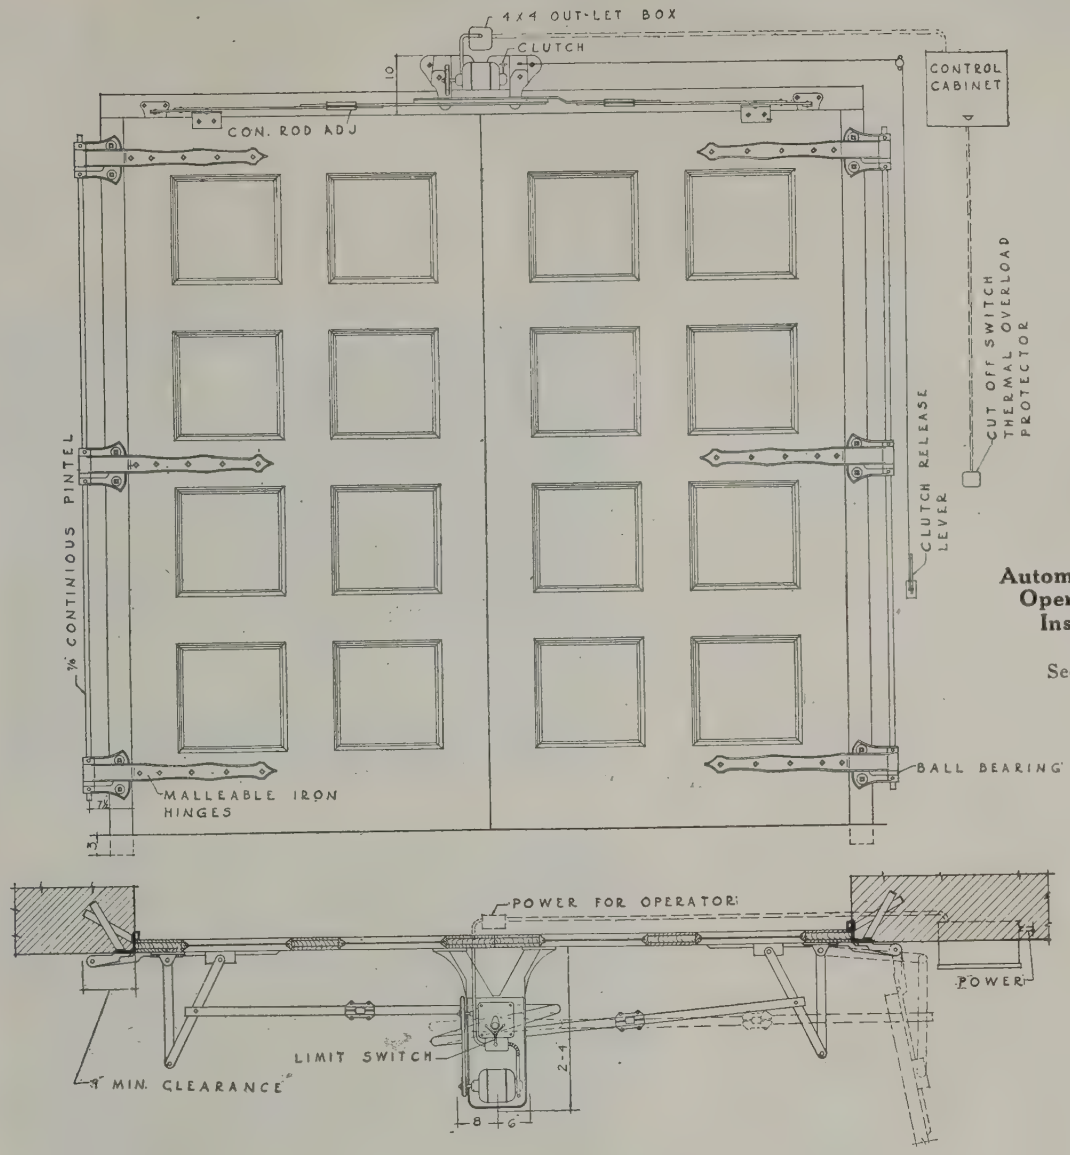


Section Through Automatic Electric Door Operator for Swinging and Folding Doors



Section Through Automatic Electric Door Operator for Sliding Door

Continued on next page



Automatic Electric Door Operator and Hardware Installed on Double-Swing Doors
See specifications below

Specifications

Operator—Furnish and install complete electric door operator with single button, momentary contact, remote controls for starting, stopping and reversing doors. Operator must give smooth, quiet, dependable service. Operator must be equipped with releasing clutch to allow for manual operation of doors; and thermal over-load cut-out for protection of mechanism. Above as manufactured by the Automatic Door & Equipment Company and installed in accordance with drawings furnished by them.

Hardware—***Four-fold***—Furnish and install special approved malleable iron, offset, ball bearing hardware consisting of heavy tubular track enclosing roller bearing hangers; malleable iron, offset standing hinges swung on a continuous ⅞-in. cold rolled shaft fastened to the steel frame by malleable iron brackets designed to allow doors to fold back of jambs when open; rubber astragals with metal binding strips at the meeting edges of doors; floor guide and necessary bolts; two door pulls. Above as manufactured by the Automatic Door & Equipment Company, Chicago, Ill.

Double Swing—Furnish and install special approved malleable iron, offset, ball bearing hinges swung on continuous ⅞-in. cold rolled shaft fastened to the steel frame by malleable iron brackets designed to allow doors to swing back of jambs when open; all necessary bolts; floor stop; door pulls. Above as manufactured by the Automatic Door & Equipment Company, Chicago, Ill.

Doors—Furnish and install three-ply, glued, selected white pine doors fitted and shaped for rubber astragals and rabbetted at the folds; not glazed; approved design. Above as manufactured by the Automatic Door & Equipment Company, Chicago, Ill.

Steel Frames—Furnish and install approved steel door frames manufactured by the Automatic Door & Equipment Company, Chicago, Ill.

Detail drawings are furnished on every job.

Measurements Required for Estimates

Side and head clearances are indicated in accompanying illustrations. Send detail section through walls at head and jambs.

The following measurements are required for estimate:

1. Type of doors.
2. Thickness of doors.
3. Width and height of wall opening.
4. Clearance on each side of jambs.
5. Clearance overhead.
6. Type of ceiling.
7. Type of wall.
8. Thickness of wall.
9. Is inside of wall flush with door?
10. Are hinges offset?
11. Power specifications.
12. Are wheel guards required?

Products and Services

Mechanically operated OGDEN SINGLE SECTION TURNOVER DOORS.

Also Ogden Two-section Turnover Doors, Ogden Canopy Doors, Ogden Airplane Hangar Doors, and Ferry Bridge Operating Mechanism.

This company is interested in the Design, Manufacture, and Erection, of all the above named specialties.

Low Cost

You are interested in saving money and maintenance troubles, and at the same time always having doors in working condition, without paying an extra premium, in first cost, to accomplish this. The Ogden Company, therefore, asks you to see its engineers about the new single section turnover door which it has developed to give all of these results.

Use

This new door is for use in warehouses, industrial buildings, railroad freight sheds and public garages. It is comparable in price (and often lower in price) than a rolling steel door.

Advantages

This new door is forever free from rattles, rusting out between slats, trouble with hinges and deflection in high winds. It lends itself to the use of glass in the upper portion and a pass door in the lower portion—two things highly valuable in large warehouses.

This single section door is automatic in locking when closed, thus making it positive in closing, a thing that is seldom accomplished in the so-called jack-knife door. Unlocking is a manual operation.

A Prominent Installation

We have installed 136 of these doors in the large new warehouse of the Seaboard Terminal & Refrigeration Co., at Eleventh and Coles Streets, Jersey City, N. J. Cuts of these doors are shown on this page.

Only Data Necessary

You furnish us with the door opening dimensions. We design, manufacture, and install the doors, guides and mechanisms and erect them completely.

Specifications

Door sections shall be of a skeleton steel construction, covered on outside with No. .... (black or galvanized, flat or crimped) steel. The door shall be of the slotted link bar type and be easily operated by one man.

Door sections shall be supported by links attached near the center of gravity so that a continuous pull on the chains attached to lower corner of door section will raise the bottom edge of door vertically and will swing the top of the door away from the door header, until, in its final open position, the door assumes a horizontal position extending into the building.

Each corner of the door section shall be securely locked when closed. These locks shall be automatic in closing. The top locks shall be manually operated in opening.

Consult City or Telephone Directory for Name of Nearest Representative or Write the Main Office

Products

REVOLVING DOORS and ENCLOSURES: wood, metal covered and hollow metal; Wings—"Curved" (exclusive patent) and "Straight"; Types—Safety Exit or Panic-proof (NLD and NLE), Full-folding (PB), Semi-folding (C), Overhead Carriage (K) Contiguous Trim, Doors and Accessories in wood and bronze.

Revolving Door Benefits

Conserve Health—Prevent drafts, control ventilation, eliminate dust.

Convenience—Save floor space, reduce entrance effort by elimination of wind pressure, prevent confusion by automatic traffic division.

Increased Capacity—2000 to 3000 persons per hour each way (greater than is usual with swing doors).

Economy—20% annual return on investment due to fuel saving. A door pays for itself in about 5 years.

Always Open—To traffic.

Always Closed—To outside winds and cold.

General Data—Manufacturer's Recommendations

Adaptability—For office buildings, hotels, banks, department stores and all public and semipublic buildings where periodic or continuous traffic congestion exists.

Capacity Provision—The ideal entrance is one provided with revolving doors of sufficient capacity for normal traffic, flanked by single or pairs of swing doors. (See suggested arrangements or send plan of present entrance for individual recommendations.)

Where not originally included, provision should be made for future installations with the least structural change. Preliminary suggestions will be gladly submitted by our service department.

Sizes—For dimensions see cuts No. 164 and No. 166 (second page following). 4-wing doors *should not be less* than 6 ft. inside diameter. The standard is 6 ft. 6 in. except in hotels where 7 ft., 7 ft. 6 in. or even 8 ft. is needed for the convenient handling of luggage.

3-wing doors may be 4 ft. 6 in. to 5 ft. 6 in. in diameter. They are adapted for use where space is too small for 4-wing door or where less capacity is required.

Inside height should be 7 ft. to 8 ft., standard being 7 ft.

Access to Bearing—Space over door *should* (not *must*) be accessible for oiling and adjusting main bearing.

Glass—That the braces may be set sufficiently high to reduce racking strains, 24 in. is recommended as the minimum height from floor to bottom of wing glass.

Avoid other than rectangular glass, to avoid breakage. Beveling is undesirable because of refraction.

Marble Enclosures—Atchison wings are ideal for use with marble enclosures, as no ceiling slot is needed, and slabs can be supported from bearing channel which lies directly over it. Only a 1¾-in. center hole is needed —no other provision prior to placing of wings, except access to space overhead. Always provide anti-flap bevel or relief at ends of walls.

Types

Type NLD or NLE Safety Exit or Panicproof—For doors that are the *sole* exits for massed crowds (not offices, banks or hotels). Their added expense is not warranted for exits where side swinging doors are present or for average exit conditions. Wings assume full line collapsed position and allow passage at either side without revolving. They *also fold aside* like Type PB. See cut No. 165 (following page).

Type NLD is equipped with push-bar-release, monel cable brace and toggle tightener which will open under panic conditions without knowledge of the mechanism, but which *will not* release under jars, ordinary traffic, or wind pressure. Type NLE is equipped with simple automatic releasing cast bar braces.

Type PB Full-folding—Standard wings fold aside in pairs, on pivots, and lie entirely back of the chord line. They lock or unlock from either inside or outside at both top and bottom in diagonal position. They may be fastened (to ceiling only) in crosswise, quartering or lengthwise position.

Type C Semi-folding—Wings fold into one plane not detached from central pivot and in lengthwise position only (to allow unrestricted passage and passing objects through).

Note: When revolving, they have the same value as other types, and are adapted to use where traffic does not justify investment in the more expensive types.

Type K—Overhead carriage suspension dispenses with side folding pivots, uses a ceiling slot and folds to one side. This type is for those who prefer, at a lower price, a door without the distinctive Atchison features.

Special Features

"Curved Wings"—An exclusive basic improvement in design of outstanding importance surpassing all secondary improvements affecting manner of folding, collapsing and locking. The "curved wings" increase usable space 6 in. in front of the body, permitting a more natural, upright position and easy stride in the line of traffic than is possible with the straight wing.

The "curved wing" is quoted at actual extra cost, under a policy of many years standing.

Experience *shows* that breakage of "curved wing" glass is extremely rare. A replacement plate may be carried or can be obtained promptly from stock at cost.

Folding of Wings—When desired, the wings (with exception of Types C and K) fold aside in pairs and *lie entirely back* of the enclosure wall opening or chord line *leaving full unrestricted passage space.* Note the particular advantages in this respect of the "curved wing" design. The main wings (to which the secondary wings are hinged) have top and bottom pivots operated by a powerful lever mechanism in the outer stile. By setting these pivots and releasing the wings from each other and from center pivot and hanger stem, wings swing smoothly back against enclosure walls. The folding operation may be accomplished with ease in 30 seconds.

No Ceiling Slot—Due to the Atchison method of folding, the conspicuous and unsightly ceiling slot with traveling suspension carriage is eliminated, except in Type K.

Screen Doors—Light double acting screen or flap doors may be hung with removable hanging strips to enclosure wall ends without interference with wings (an exclusive Atchison feature).

Air Lock Strips—Especially designed and selected to maintain the air lock with just the proper amount of friction. Easily adjusted. Consist of wide flexible rubber strips at bottom; heavy felt strips at top; tapered moulded rubber side strips with piano felt edges.

Materials, Construction and Finish

Wood—Wings and enclosures of all cabinet woods veneered over an improved type of laminated core construction. Material, construction and workmanship commensurate with the highest quality of cabinet work.

The highest class of painters finish applied by skilled workmen in any standard or special finish. (Samples of standard finishes furnished on request.)

Metal Covered—Bronze plate overlay construction in No. 16 gauge (recommended) or No. 20 gauge, applied with special metal holding adhesive, under heavy pressure, to hardwood faced, laminated cores, with hair-line reinforced joints.

Note: This construction is particularly recommended for wings over hollow metal construction because of (1) greater stiffness to meet twisting strains (usually absent in swing doors), (2) less weight for the required stiffness (essential to avoid undesirable momentum and inertia effects), (3) lower cost, (4) greater fire resistance.

Connected work in ornamental cast iron and bronze.

Finishes to match adjacent work. Bronze recommended in fine-line medium oxidized or statuary, not lacquered. (Samples of standard finishes furnished on request.)

Hollow Metal—Enclosures furnished in No. 10 and No. 12 gauge, with drawn and extruded moulds. Wings in No. 14 gauge, specially constructed for stiffness.

Hardware—Heavy, plain design, cast bronze in either polished or brushed natural finish.

Cylinder locks (master-keyed if desired) are standard equipment.

Stock Doors and Enclosures

To be had in one design only, as shown, size 6 ft. 6 in. diameter by 7 ft. high. In oak, gum or birch. All types, with or without glass in enclosure walls. Finished to suit.

At considerable saving over cost of door especially designed.

Specifications

Furnish and install, where shown on plans and details, revolving doors as made by The Atchison Revolving Door Co., Independence, Kan.

(Here specify optional requirements.)

Design: Special or stock. Type: PB; C; NLD or NLE. Wings: "Curved" or "Straight." Material and finish. Connections. Special equipment, ceiling lights. Master-keyed cylinders, etc. Write for suggested detailed open specification form if desired.

Facilities

Experience—Atchison Revolving Doors have been made continuously since 1906. An outgrowth of 50 years' millwork experience.

Plant—A modern efficiently planned and lighted one-story plant of 75,000 sq. ft. area, equipped throughout with the most modern motor driven machinery. A woodworking factory accustomed to executing and finishing the highest grade cabinet millwork. A complete metal covered and hollow metal door shop. A complete foundry. Every part (except lock cylinders) from the simplest wood to the most elaborate metal doorway executed under our own roof and under closest supervision.

Location—Favorable manufacturing conditions; uninterrupted, prompt, economical execution and advantageous shipping facilities to any part of the United States.

Patents—The "Curved Wing" and other Atchison exclusive features are protected by patent. This company will guarantee against loss or damage from any infringement suits.

Service—Adequate and capable Engineering and Service Department maintained at plant and Atchison agents accessible in all principal cities of the United States and Canada.

Quotations and Ordering

Agents can generally quote direct on stock designs. Due to numerous variations in material, design, finish and equipment, special design doors must be quoted upon by the factory.

Approximate or comparative estimates from sketch plans and designs promptly furnished.

We urge the placing of orders in the spring and summer to avoid seasonal congestion of fall and winter.

Products

VAN KANNEL REVOLVING DOORS (3-Wing and 4-Wing styles) in three distinct types:

Automatic Collapsible, Panicproof Type.
Standard "C" Rigid Brace Arm Type.
Standard "N" Rigid Brace Arm Type.

Also manufacturers of Van Kannel Revolving Pantry Windows (Patented).

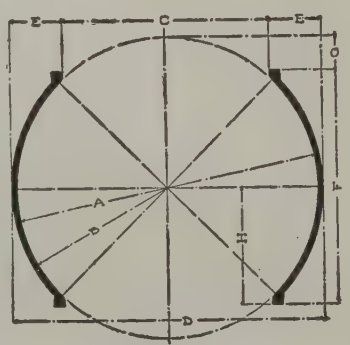
Original Patentee

This company is the pioneer manufacturer and original patentee of revolving doors; its patents cover every practical improvement and substantial feature.

Van Kannel Revolving Doors

Automatic Burglar Lock—Van Kannel Revolving Doors may be furnished with an automatic electrically controlled burglar lock which may be actuated by any number of push buttons located in any part of the building. Closing the circuit insures instantaneous locking of the door.

Materials—Materials used for entire construction are any kind of hardwood, bronze or steel on a metal frame or wood core covered with various gages of metals in either copper, steel or bronze, using the following gages—Nos. 24, 20, 16. Revolving door vestibules may be made of other materials such as marble, tile or cement, as may be needed in order to carry out architectural treatments.



Dimension Diagram

Stock Designs—Several stock designs are carried on hand in plain oak and birch, on which practically immediate delivery can be quoted. See stock series and stock special doors as illustrated.

Automatic Collapsible, Panicproof Type—This type of door has 3 or 4 wings hung independently of each other on a central shaft of metal and wings are held together by flexible cables. This type of door gives a feature of absolute safety at all times and under all conditions. The safety feature lies in the fact that the revolving wings are so arranged that by application of pressure to any part of the revolving door, slightly more than necessary to revolve door, the revolving wings will instantly and automatically collapse and fold outwardly in line of egress, leaving a free, unobstructed passageway.

Rigid Brace Arm Type, Styles "C" and "N"—These two types consist of either 3 or 4 wings, held together in their radial position by rigid braces; wings are collapsed only by means of pressing a spring when it is desired to have doors open in the middle, or pushed to one side for a wide open passageway. These types, although collapsible as to folding of wings, are not automatically so, as in case of automatic collapsible, panicproof type of door previously described.

3-Wing Revolving Door—The 3-wing revolving door is especially adapted for entrances that are too small to accommodate a 4-wing door at least 6 ft. in diameter. It is being used to a great extent in entrances to toilet rooms in schools, institutions and public buildings and the company has installed 34 of these doors for the Prudential building, Newark, N. J. Approximately, 5 ft. diameter.

3-Wing Revolving Door

Stock Standard Design 8, Illustration No. 5—Furnish and install where shown on plans, revolving doors of the Van Kannel Revolving Door Co. make, Standard Design 8, Automatic Collapsible Panic Proof mechanism. Woodwork to be birch. Finish to match surrounding trim.

Stock "Series" Illustration No. 6—Furnish and install where shown on plans, revolving doors of the Van Kannel Door Co. make, Design Stock "Series" [No. 1S] [No. 2S] Collapsible. Woodwork to be white pine. Finish to match surrounding trim.

Type "N" Fixtures

This type of fixture may be applied to any 4-wing design of Van Kannel Revolving Door, made of any material. The four wings are held in their revolving position by means of metal brace arms in the form of hooks. When it is desired to fold the wings for any reason it is only necessary to unhook the brace arms and hook them back against the fixed wings, since all the four brace arms are attached to these wings by means of sockets. After the brace hooks are caught back, as above mentioned, the two hinged wings can be folded and the revolving door may assume positions illustrated on following page.

Literature

Send for our 24-page "Manual of Revolving Door Construction and Architectural Design."

Positions Assumed by Wings

Note on following page position assumed by wings of various types here shown.

Positions Assumed by Wings

Fig. 1
REVOLVING POSITION
Four wings extended, permitting persons to pass in and out, at the same time excluding noise, rain and snow, heat and cold, wind and dust

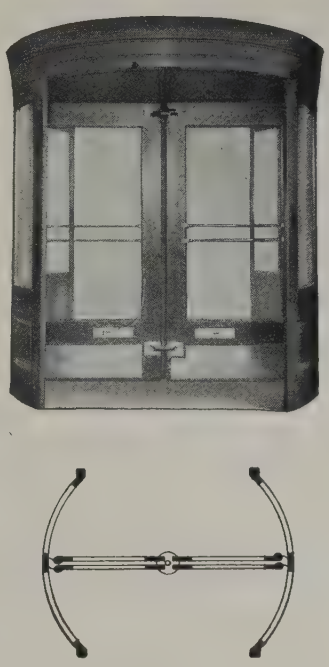

Fig. 2
LOCKED POSITION
Four wings folded in pairs and placed across vestibule, securely locked or bolted. Lock operates from both sides

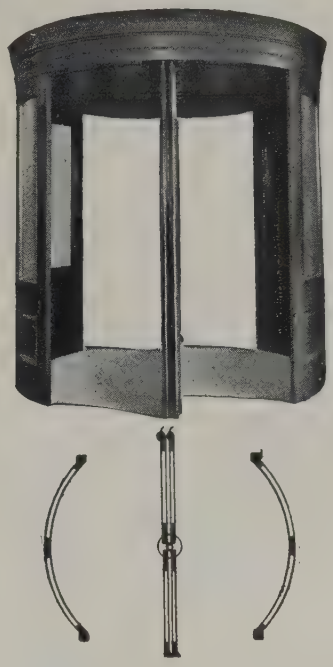

Fig. 3
CENTRAL OPEN POSITION
Wings folded flat in pairs and held in position by folding bars, making two passages separating traffic

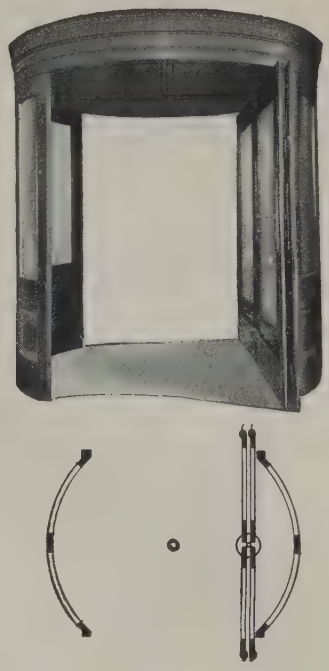

Fig. 4
FULL OPEN POSITION
Wings folded and moved aside, making available full width of entrance

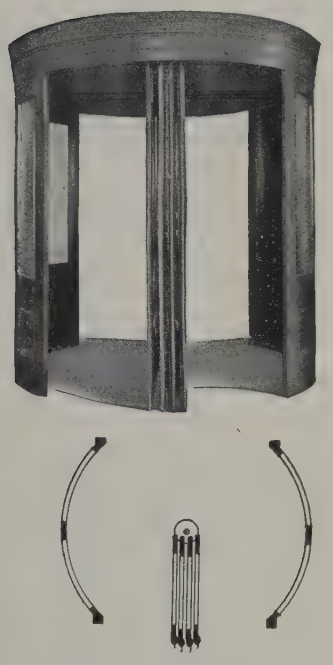

Fig. 5
PANIC COLLAPSED POSITION
Wings folded on each other in outward position, dividing traffic into two streams

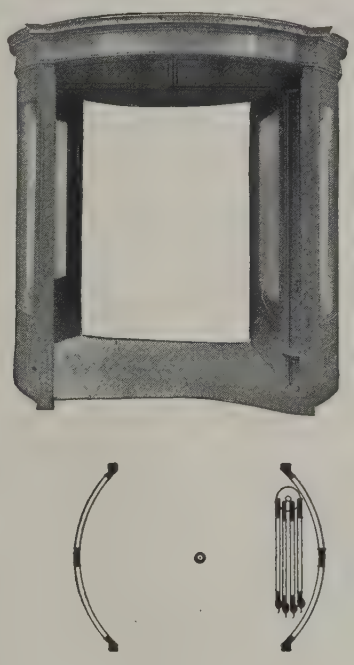

Fig. 6
FULL OPEN POSITION WITH WINGS COLLAPSED
Wings folded on each other and moved to one side making available full width of entrance

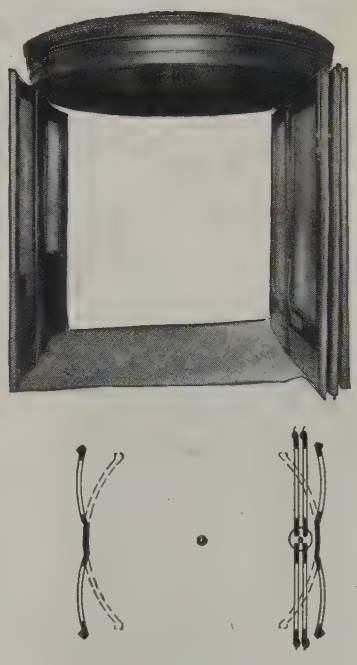

Fig. 7
FULL OPEN POSITION WITH FLEXED WALLS
Wings folded and moved aside with hinged walls flexed for added space

Fig. 8
PANIC COLLAPSED POSITION WITH FLEXED WALLS
Wings folded on each other in outward position with walls flexed for added space

Positions Assumed by Wings—All Types of Doors

Note: One wing may also be folded at a time if desired.

TYPE STOCK "SERIES"—Positions Nos. 1, 2, 3 and 4 assumed by wings.

TYPE STOCK "SPECIAL"—Positions Nos. 1, 2, 3, 4 and 5 assumed by wings.

TYPE C COLLAPSIBLE—Positions Nos. 1, 2, 3 and 4 assumed by wings.

TYPE N COLLAPSIBLE—Positions Nos. 1, 2, 3 and 4 assumed by wings.

TYPE JC AUTOMATIC COLLAPSIBLE—Positions Nos. 1, 2, 3, 4 and 5 assumed by wings.

Note A—Special trolley construction can be furnished which will permit wings to assume position shown in Fig. 6.

Flexed Walls—In order to provide added entrance space where desired, flexed wall construction can be furnished which will permit wings to assume postions shown in Figs. 7 and 8.

Products and Services

REVOLVING DOORS of every description and of any desired material.

Specialists in all Mechanical Devices as applied to Revolving Doors.

Complete installations contracted for anywhere in the United States and Canada.

This company supplies Fixtures for Revolving Doors to manufacturers of cabinet work, kalamein work, hollow steel and architectural bronze work, together with construction details and, if desired, assembling and erecting labor.

Automatic Panicproof Revolving Door

Wings are suspended from a universal ball bearing located in a dustproof oil chamber mounted on a carriage running on tracks. The wings can be folded centrally and moved to one side in the usual manner.

Each wing is hung to the center post with spring hinges, which hold it under spring control when the braces are detached, preventing slamming of the wings against each other and breaking the glass, which happens in other panicproof revolving doors.

The Slip-bar—The braces which hold the wings in rotating position are the vital feature of a panicproof door. This company uses neither cables nor chains, but manufactures the only slip-bar brace that pushes or pulls out under undue pressure. Brace is positive in action, durable, and conforms to building and fire department regulations.

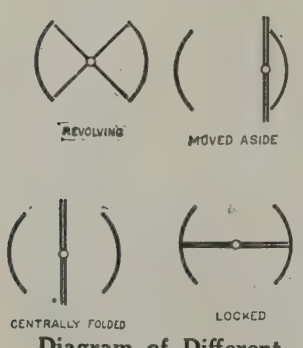

Diagram of Different Positions of Wings

Standard Design No. 106, Panicproof Slip-bar Construction

Adaptable to slight architectural changes. Any material; any wood or hardware finish; kick plates and key locking bolts when desired

Some Recent Installations

Kalman Steel Buck and Bead

The new Kalman Steel Buck and Bead replaces wood rough buck, ground, and standing trim in constructing interior or exterior door, plaster jamb, and borrowed light openings.

The Kalman Steel Buck and Bead has been perfected by the KALMAN STEEL COMPANY for use with clay, gypsum tile or solid plaster partitions, or in brick and masonry walls, and it has many definite advantages when used with wood stud walls and metal lath.

(1) It provides a heavy galvanized steel member in place of the usual wood buck.

(2) It eliminates plaster cracks caused by warping of the wood buck.

(3) It provides a steel lintel, eliminating plaster cracks due to shrinkage.

(4) It provides a superior construction at no increase in cost.

(5) It eliminates wood grounds and provides a positive finish and edge for the plaster.

(6) It provides positive anchorge between buck and wall.

(7) It permits of the elimination of standing trim.

(8) It eliminates the necessity for patching and pointing plaster.

(9) It eliminates unsightly split casings.

(10) It increases wall space.

(11) It reduces maintenance cost.

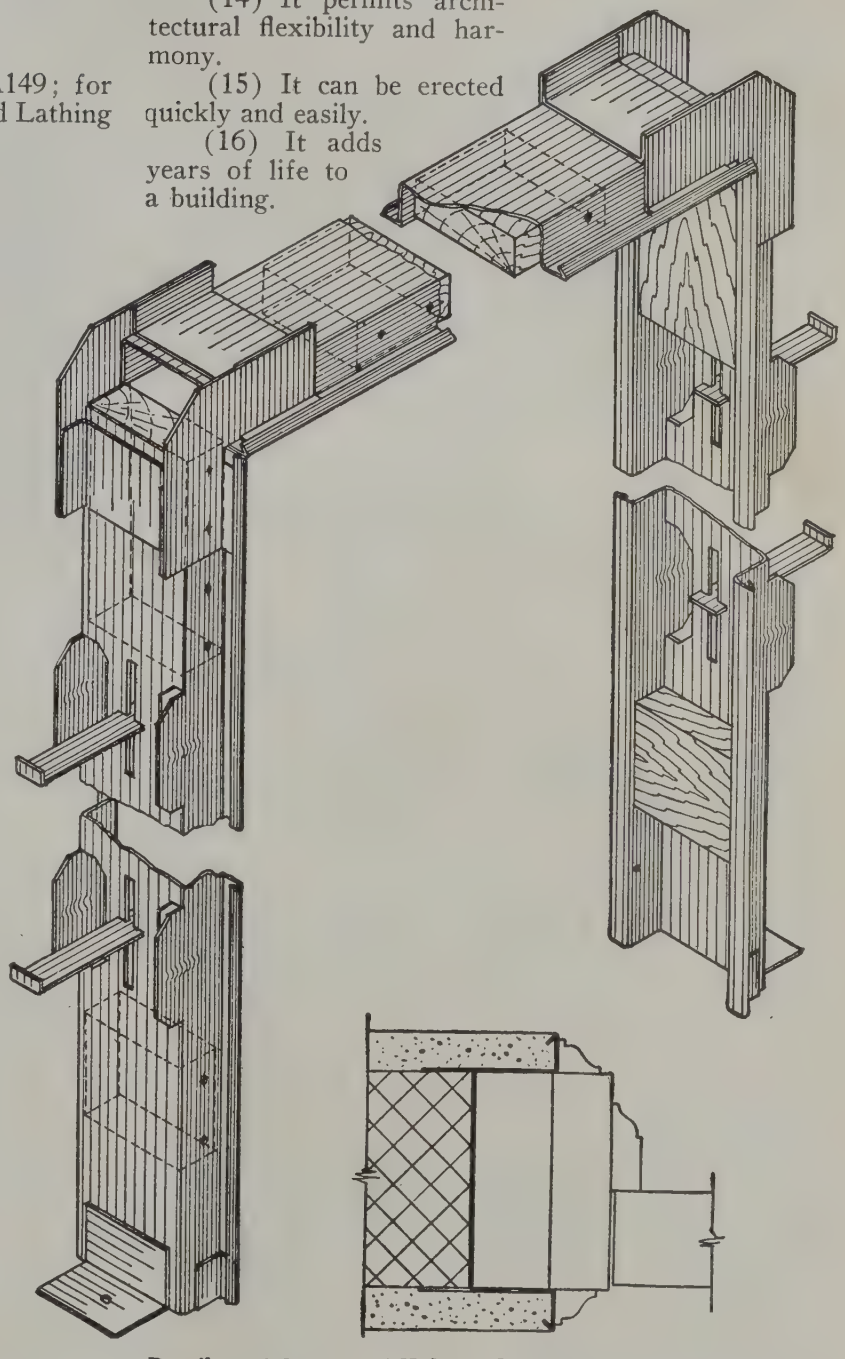
(12) It reduces fire hazard.

(13) It eliminates dust catchers.

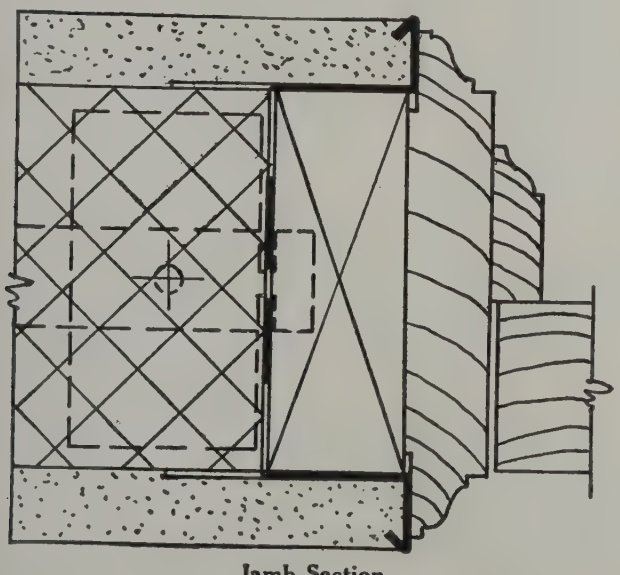
(14) It permits architectural flexibility and harmony.

(15) It can be erected quickly and easily.

(16) It adds years of life to a building.



Details and Section of Kalman Steel Buck and Bead



Jamb Section

Kalmantrim

Kalmantrim makes it possible to finish window openings without standing trim, or a plaster return.

The sash stop made with any desired profile produces perfect harmony between the window and door openings in which the buck and bead is installed.

Kalmantrim can be used to advantage in finishing doorways where wood studs are used and especially when wood lath is the plaster base.

THE LEONARD SHEET METAL WORKS, INC.

Also Copper Covered Doors and Windows.

Facilities and Service

Our plant is one of the largest in this line and our output runs from 1500 to 2000 steel bucks per week. Output of steel covered doors from 500 to 1000 per week. Everything turned out is a quality job and delivered on date specified.

Steel Bucks

The details shown on the following page are the latest type. The 16 gage rolled steel combination bucks illustrated in Fig. 1 are made for 6, 4 and 3-in. partition walls, to receive 1¾-in. thick doors. The buck for a 3-in. wall can be made for 1⅜-in. doors.

The bucks numbered A, A3, C, and C1 are 16 gage rolled steel type.

Steel Bucks Type B—Pressed steel bucks illustrated are made in 16, 14, 12 and 8 gage to fit any width partition or wall and to any thickness rabbet or width of flange. These bucks can be arranged with applied, clipped or spot-welded trim.

Sanitary Design Buck Type D—Pressed steel buck shown is made in 14, 12 and 10 gage. This type of buck is used in Bell Telephone Co. buildings and various hospitals because of the sanitary design.

Furniture Steel Covered Doors

Leonard Furniture Steel Covered Doors are made of 22 gage furniture steel with various types of paneling and glazing and with 20 gage hollow steel moulding. The moulding is welded into the frames and housed in stiles and rails when doors are put together. The stiles and rails are mortised, tenoned and doweled.

Underwriters' labeled doors can be had in furniture steel at very little extra cost.

Hollow Steel Doors

Made of 18 gage rolled steel. The principal feature of these doors is the rolled edge strip which takes all of the cut-out and reinforcement for hardware. This means that as long as we have the size of the door and type of paneling we can proceed with the manufacturing of the door without waiting for the hardware.

Hollow steel doors come only in a prime finish.

Can also get Underwriters' label service on these doors at small extra cost.

Rolled Steel Windows

Our standard on these windows is 22 gage galvanized steel for frames, 14 gage galvanized steel for sash, 16 gage galvanized steel for sills and 14 gage furniture steel for stools. Frames, sills and stools can be heavier if desired. Windows are labeled by the National Board of Fire Underwriters.

Bronze Covered Doors

Our standard doors can be covered with 20, 18 or 16 gage bronze for rails, stiles and panels. Extruded bronze shapes are used for mouldings and edge pieces. Cast bronze ornaments can be applied to rails, stiles, and panels.

Bronze Store Fronts

Made over white pine cores, in either 20 or 16 gage bronze, to architects' designs.

Reference list of installations furnished upon request.

Leonard Bronze Store Front Work

"Biltrite" Hollow Steel Underwriters' Doors

This is a 20 gage steel built-up door which is manufactured under supervision of the National Board of Fire Underwriters. Can be either slide or swing. Used for vertical shafts, party walls, boiler and transformer rooms. Made in two thicknesses, equivalent to 2 and 3-ply tin covered doors.

They pass any classification of the Underwriters.

SWING DOOR UNITS.

ELEVATOR ENCLOSURES.

Also Dumbwaiter Enclosures; Mouldings; Interchangeable Partitions; Louvres and Grilles; Sills and Weatherstrips.

Facilities

A plant covering more than 6½ acres, designed and built solely for the manufacture of hollow metal products. Equipped throughout with the most modern machinery and equipment.

Service

A competent engineering staff is at all times available for advisory service.

Catalogue

We have prepared a comprehensive catalogue giving essential information needed to detail and specify hollow metal doors and trim to meet almost any situation. Elevator door operating hardware, together with fire underwriters' requirements, have also been fully covered. We will be glad to send you a copy.

SWING DOOR UNITS AND ELEVATOR ENCLOSURES

Materials

Materials used are the best of their respective kinds. Steel is of the highest grade commercial furniture stock of U. S. standard gauge.

Workmanship

All work is executed by skilled mechanics and is of the finest grade. It is neat in appearance and free from defects.

Hollow Steel Swing Door Units

Doors and Sash (Metal Panel Type)—Panels are constructed of two 18 gauge steel plates separated by heat retarding filler. Panel mouldings, cold drawn to profile, are fitted to panels, mitered and welded at corners, forming a continuous frame around panels.

Stiles and rails are formed of 18 gauge steel and continuously interlocked to panel mouldings. Stiles are fitted to rails, reinforced and welded at joints. Stiffener channels extending full width are welded inside the doors at top and bottom.

Compressed cork is provided in stiles and rails of doors to eliminate metallic sound.

Doors and Sash (Flush Type)—Doors and sash are constructed of two 18 gauge steel plates locked together with special interlocking members welded to plates. Members are spaced not more than 6 in. apart and extend full height of doors and sash.

Continuous reinforcements and stiffener channels are welded inside the doors and sash at top and bottom, and in both sides.

Compressed cork is placed in doors to eliminate metallic sound.

Doors and Sash (Glass Panel Type)—Glass panels are held in place by removable mouldings which are secured to stationary mouldings with oval head machine screws. Mouldings are cold drawn to profile and are made into frames with corners mitered and welded. Stiles and rails are interlocked to stationary mouldings as described under "Metal Panel Type."

When doors are "Flush Type," stationary mouldings are interlocked to plates in a similar manner.

Muntins are constructed of cold drawn interlocking shapes fitted and welded to panel mouldings.

Where mirrors occur, 18 gauge steel plates are provided for backing up.

Stall Doors—Stiles and rails are formed of 20 gauge steel and continuously interlocked to 16 or 18 gauge steel panels. Stiles are fitted to rails and welded at joints.

Astragals—Astragals are of cold drawn interlocking shapes welded to door stiles.

Grilles—Grilles are of 14 gauge perforated steel secured in doors in the same manner as metal or glass panels. When grilles are desired in bottom rails they are usually formed as a part of the rail.

Louvres (Stationary Type)—Louvres, constructed of specially formed 18 gauge steel members, are secured in doors in a substantial manner.

Ventadoors, Panelouvres and Servidors—Doors are prepared to receive these products which are usually furnished under separate contract.

Ventadoors and Panelouvres are ordinarily delivered to our factory completely finished, and installed in the doors by us.

Servidors are usually delivered direct to the building and installed in the doors by Servidor contractor.

Frames (Rough Buck and Cabinet Jamb Type)—Bucks are formed of 12 or 14 gauge steel, welded at corners, provided with anchors for securing to walls and clip angles at bottom for fastening to floor.

When bucks are shipped knocked down, side members are provided with tenons for securing to heads.

Jambs, formed of 16 or 18 gauge steel, are secured to steel bucks by machine screws, and to wood bucks, which are usually furnished and erected under separate contract, by wood screws.

Stationary doors and sash, or glass panels, are retained by removable cold drawn moulding or channel frames, secured to jambs by oval head machine screws.

Frames (Combination Buck and Jamb Type)—Frames are formed of 12, 14 or 16 gauge steel, mitered or coped and welded at corners. Anchors are provided for securing frames to walls and clip angles at bottom for fastening to floor.

Glass panels, or stationary doors and sash, are held in place by removable cold drawn moulding or channel frames, secured to frames by oval head machine screws.

Frames (Combination Buck, Jamb and Trim—Rolled Type)—Frames are cold rolled of 16 gauge steel. The jamb portions of side members are coped and tenoned to heads, while casing portions are mitered and acetylene welded.

Frames are provided with wire anchors for securing to walls and clip angles at bottom for fastening to floor. Special anchoring arrangement is provided for frames in plaster, wood stud or Simplex partitions.

Glass panels are retained by removable cold drawn channels, coped at corners, and secured to frames by oval head machine screws.

Transom Bars and Mullions (Rough Buck and Cabinet Jamb Type)—Bucks are formed of 12 or 14 gauge steel, welded to frames or secured by concealed clip angles and screws as conditions warrant.

Jambs are formed of 16 or 18 gauge steel, secured to steel bucks by machine screws, or to wood bucks, which are usually furnished and erected under separate contract, by wood screws.

Transom Bars and Mullions (Combination Buck and Jamb Type)—Transom bars and mullions are formed of 12, 14, 16 or 18 gauge steel, welded to frames or secured by concealed clip angles and screws as conditions warrant.

Continued on next page

Weatherstrips—Exterior openings are made weathertight at sides and heads by felt, rubber or spring bronze weatherstripping, and at the bottom by bronze interlocking shapes or specially formed steel strips.

Casings—Casings are of 18 gauge cold drawn shapes with corners mitered, welded, and secured to frames by concealed fastenings or oval head machine screws.

Scribe Mouldings—Mouldings are cold drawn of 18 gauge steel, mitered or coped at corners, and secured to frames by oval head machine screws.

Plinths—Plinths are formed of 18 gauge steel, secured to frames by concealed fastenings or oval head machine screws.

Hardware and Reinforcements—Hardware must be to template and is ordinarily supplied under separate contract.

All work is mortised, reinforced, drilled and tapped at the factory to receive hardware, except that frames are usually drilled and tapped for surface hardware at the building by the contractor erecting the doors.

Combination type frames are provided with cover boxes in back of hardware cutouts.

Fire Underwriters' Labels—Our products have been listed by the Fire Underwriters' Laboratories for Class A, B, C, D and E situations.

Hollow Steel Elevator Enclosures

Doors (Metal Panel Type)—Panels are constructed of two 18 gauge steel plates separated by heat-retarding filler. Panel mouldings—cold drawn to profile—are fitted to panels, mitered and welded at corners, forming a continuous frame around panels.

Stiles and rails are cold rolled of 12 gauge steel and continuously interlocked to panel mouldings. Stiles are fitted to rails and welded at joints. Stiffener channels extending full width are welded inside the doors at the bottom.

Continuous rubber bumpers, secured in place by neat cold drawn mouldings, are provided for center-parting doors. For all other types, rubber bumpers are fastened to frames and sills.

Two cast iron guides are attached to the bottom of each sliding door. Flush bolts are used as guides when doors are combination slide and swing.

Doors (Flush Type)—Doors are constructed of two 18 gauge steel plates locked together with special interlocking members welded to plates. These members are spaced not more than 6 in. apart and extend full height of doors. Continuous reinforcements and stiffener channels are welded inside the doors at top and bottom, and in both sides. Compressed cork is placed in doors to eliminate metallic sound.

Continuous rubber bumpers, secured in place by neat cold drawn mouldings, are provided for center-parting doors. For all other types, rubber bumpers are fastened to frames and sills.

Two cast iron guides are attached to the bottom of each sliding door. Flush bolts are used as guides when doors are combination slide and swing.

Doors (Glass Panel Type)—Glass panels are held in place by removable mouldings which are secured to stationary mouldings with oval head machine screws. Mouldings are cold drawn to profile and are made into frames with corners mitered and welded. Stiles and rails are interlocked to stationary mouldings as described under "Metal Panel Type."

When doors are "Flush Type," stationary mouldings are interlocked to plates in a similar manner.

Muntins are constructed of cold drawn interlocking shapes, fitted and welded to panel mouldings.

Where mirrors occur, 18 gauge steel plates are provided for backing up.

Stationary Panels—Panels are constructed as previously described for doors, with the exception that no provisions are made for hardware or guides. Panels are secured to frames at the head and side with machine screws, and held in place at the bottom by channels fastened to sills.

Glass—Glass, which is usually furnished by us, is set in rubber inserts and putty and held in place by removable moulding frames.

Mirrors are set in the same manner, with the exception that they are backed up with felt.

Hanger Housings—Hanger housings are formed of two 12 gauge steel plates spot-welded together and firmly fastened to angle supports at both ends with machine bolts and nuts.

Angle Supports—Hanger housings are supported independent of the walls by two structural steel angles extending from sill to either steel or concrete beam overhead and securely fastened in place. One of these angles is located to act as a closer support when closers or pneumatic operators are used.

Hanger Covers—Hanger covers are formed of 16 or 18 gauge steel and attached to hanger housings by concealed method. Ready access to hangers is permitted without removing covers.

Frames (Combination Buck, Jamb and Trim Type)—Frames are formed of 16 gauge steel mitered and welded at corners. They are securely fastened to hanger housings with machine screws and to the sills with clip angles and cap screws. Where required, a suitable number of rubber bumpers is provided.

Frames (Combination Buck and Jamb Type)—Frames are formed of 12, 14 or 16 gauge steel, either mitered or coped and welded at corners. They are securely fastened to hanger housings with machine screws and to the sills with clip angles and cap screws. Where required, a suitable number of rubber bumpers is provided.

Sills—Sills are either close grain gray iron or bronze castings with non-slip surfaces, securely anchored to either structural steel or concrete. The grooves for door guides are machined. Bumper angles, secured to sills with cap screws, are provided where required.

Facias—Facias are formed of either 14 or 16 gauge steel, substantially reinforced where necessary, and securely fastened in place.

Casings—Casings are cold drawn of 18 gauge steel, mitered and welded at corners, and secured to frames by concealed fastenings or oval head machine screws.

Scribe Mouldings—Mouldings are cold drawn of 18 gauge steel either mitered or coped at corners, and secured to frames by oval head machine screws.

Plinths—Plinths are formed of 18 gauge steel and secured to frames by concealed fastenings or oval head machine screws.

Hardware and Reinforcements—Hardware must be to template and is usually included in our contract.

All work is mortised where required, reinforced, drilled and tapped at the factory to receive hardware, except that drilling and tapping for bar locks, pneumatic operators, door closers, rack and pawl devices, interlocks and striker plates are done at the building.

Frames for combination slide and swing type doors are provided with cover boxes in back of all hardware cutouts.

Finish

Prime Finish (Doors and Sash)—Before assembling, metal panels are painted on the inside. After assembling, all oil, dirt and rust are removed.

Doors and sash are thoroughly coated on the inside and outside with rust resisting paint by a dip process, and then baked. Exposed surfaces are filled where required, each coat baked and sanded. Priming coat of paint is then applied and baked.

Prime Finish (All Other Work)—After assembling, all oil, dirt and rust are removed. Exposed surfaces are filled where required, each coat baked and sanded. Priming coat of paint is then applied to all surfaces, both inside and outside, and baked.

Plain Enamel Finish—Prime coat is thoroughly sanded, after which three coats of enamel of a color as selected are applied to all exposed surfaces. Each coat is baked and rubbed, the final coat being rubbed to an eggshell gloss.

Grained Finish—Prime coat is thoroughly sanded, after which all exposed surfaces are hand grained to match sample selected, and then baked. Two coats of finishing varnish are then applied, each coat baked and rubbed, the final coat being rubbed to an eggshell gloss.

Crating and Erection

Crating—The finished products are substantially crated to guard against damage in transit.

Combination type frames, when finished in baked enamel, are protected by oiled paper, and crated individually. Crating is not removed until after walls have been plastered.

Erection—All work is erected plumb and true by skilled mechanics. Rough bucks, frames, etc., are set and braced in position before partitions are built. The doors, cabinet jambs, casings, etc., are erected after plastering has been completed and the floors are broom clean.

Continued on next page

Some makes of pneumatic operators require greater clearance than shown. Heavy duty sheave type hangers require not less than 11" headroom. When bar locks are used, hanger covers must be made straight.

When sufficient space is not available to permit mounting the pneumatic operators or closers in back of doors as here detailed, these devices can be placed between the doors and cab.

When overhead pneumatic operators are used, write us for detail drawing showing condition at head.

PETERSON AND NEVILLE, INC.

Manufacturers of Pressed Steel Products: "Steelweld" Steel Door Frames, and "Kleen Kitchen" Metal Furniture

365 Dorchester Avenue, BOSTON, MASS.

Product

"Steelweld" Door Frames.

Also Medicine Cabinets, Radiator Furniture, Economy Lockers, Steel Tanks, Conveyor Buckets, Steel Platform Skids, Circuit Breaker Tanks, Steel Tote Boxes and Steel Concrete Forms.

For "Kleen Kitchen" Metal Furniture, see page C3976.

Steel Combination Door Frames

Five types of our steel combination door frames are shown in cuts A, B, C, D and E. These frames are suitable for all interior openings and are complete frames in every detail, embodying the buck, jamb and trim, with provisions made to receive all hardware, such as hinges, striking plates, locks and pads for door checks or any other special hardware.

"Steelweld" door frames are made of steel, are fireproof and free from defects. They will not sag, warp or open up at the joints as do wood frames. All joints are gas welded and ground to a smooth finish.

The economy of "Steelweld" frames becomes apparent when you consider that the erection of a "Steelweld" frame comprises the total cost of erecting a finished door opening. The buck, jamb and trim are all in one piece so there is no further cost of erecting the finished jamb and trim. Our frames can be made to accommodate walls of varying thicknesses, from a 2-inch wall up.

There are several designs of steel anchors that are used with these frames as shown in Types A, B, C, D and E. The selection of the type of anchor is left to the architect, who can select a fixed or a loose anchor as he chooses.

Type A Frame—Made of No. 14 gauge cold rolled steel of simple design and few mouldings, and is very suitable for school work.

Type B Frame—Made of No. 18 gauge auto body steel and is one that we have used extensively for apartment hotels. In lots of 1000 frames or over we can modify these mouldings somewhat to meet the architect's designs.

Type C Frame—Made of No. 16 gauge cold rolled steel with ⅞-in. plaster lock holes placed 2 in. on center as shown in sketch. We have used this type extensively in hotel work. This is a very rugged frame and one that will stand considerable abuse.

Type D Frame—Made of No. 12 gauge cold rolled steel with very simple mouldings suitable for hospital work.

Type E Frame—Made of No. 12 gauge blue annealed steel and shows another treatment to prevent the plaster from cracking where it joins the metal buck. This method is somewhat more expensive than the other types.

Statler Hotel and Office Building, Boston, Mass.

Geo. B. Post, Architect Dwight P. Robinson & Co., Builders

5000 of our "Steelweld" combination door frames used on this project

Other Uses

These same sections can be used in making up the steel door frames for elevator enclosures, also for cased openings, and all interior sash, either fixed or movable.

Service and Samples

We will be pleased to study your specific problem in detail if you will send us a set of floor plans and a copy of the specifications.

These frames can be shipped economically to any part of the country, especially if there are 400 frames or over. 400 frames fill an average car and can be loaded without the extra expense of individual crating for each frame.

Hardware templates must be furnished us with the order and with the general plans and specifications for the building.

We manufacture many types of special steel door frames and invite you to send us your problems in this line. Send for sample sections.

CASEMENT and WINDOW SECTIONS.

For Steel Mouldings, Stair Nosings and Perforated Sheets, see pages A856-857.

Catalogue

Our Catalogue No. 25 on steel mouldings contains many other sections useful for window construction.

A copy will be sent the architect, builder or owner upon request.

Features

These sections are of the two-point contact type and suitable for all windows; casement type, double hung, austral type, in- or out-opening. The large chamber makes windows constructed with them rigid, airtight and watertight.

Wide members make for ease of application and tight fit of hardware.

A special feature is the grooves in sections Nos. 1206 and 1207. Adherence of glazing and setting compound makes windows doubly weathertight.

THE ADAMS COMPANY

Manufacturers of Steel Windows and Steel Doors

109 West 6th Street
DUBUQUE, IOWA

Products

ADAMS STEEL WINDOWS: Architectural, Industrial, Basement and Laundry.

ADAMS STEEL DOORS: Architectural, Industrial and Garage.

For Adams Fireplace Dampers, Ash Pit Doors, Ash Dumps and Coal Chutes, see page A713.

Adams Steel Windows

Architectural Casement Type—Windows made according to plans and specifications with inswinging or outswinging casements, square or circle top. Fixed sections also furnished. All windows fully equipped with bronze hardware.

Finished with priming coat of battleship gray paint.

Construction—Sash and frame are constructed of rolled steel, specially formed. All joints electrically welded, which insures rigidity.

Hinges and pins made of steel or bronze.

Heavy pins, easily removed, make the glazing of the sash very simple.

Anchors for sash are furnished upon request.

Screen or wire guard provisions can be made if so desired.

Glazing—Casements are provided with wire clips or steel glazing beads.

Industrial, Basement and Laundry Type—Standard stock sizes. Price sheets upon request.

Adams Steel Doors

Special sizes to order.

Stiles and rails of these doors are made from heavy rolled, special U-shaped channel steel, with all joints electrically welded insuring strength.

Upper panels are divided by steel T-bars, with provisions for either wire glazing clips or steel glazing beads.

Lower panel is provided with steel kick plates.

Strong standard hinges with heavy steel pins.

Carriage track can be furnished.

Special Work

Steel windows and doors made to order.

Our Engineering Department will gladly work out construction details and furnish drawings for approval.

Catalogues

Catalogues, construction and installation details mailed upon request.

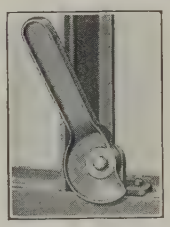
Bayley-Springfield Windows

Bayley-Springfield Windows are backed by 47 years of continuous manufacturing experience and 19 years of solid bar window sash manufacturing experience. Made in a variety of kinds for a variety of purposes. Tell us what you want and permit us to submit the necessary detail matter. The following is only suggestive.

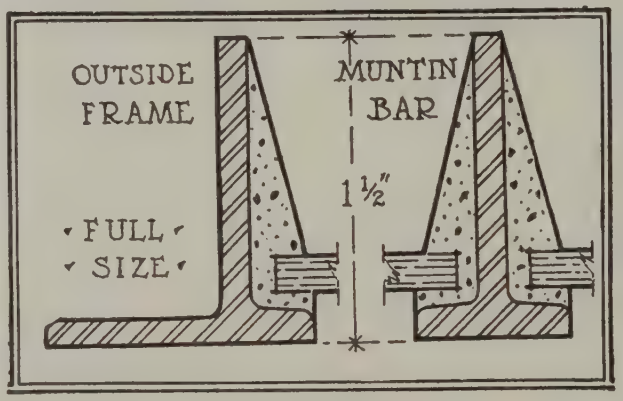
Bayley-Springfield Horizontally Pivoted Windows

Standard Sizes—47 layouts in 14x20 glass size and 47 layouts in 12x18 glass size shown on following page. These units are produced in large quantities and when used singly or in combined unit openings, meet practically all building conditions where center pivoted windows are applicable. Designers should confine requirements to these sizes to get the benefit of low prices and quick deliveries.

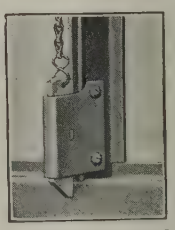
Frame and Muntin Bars—1½ in. deep provide strength and rigidity.



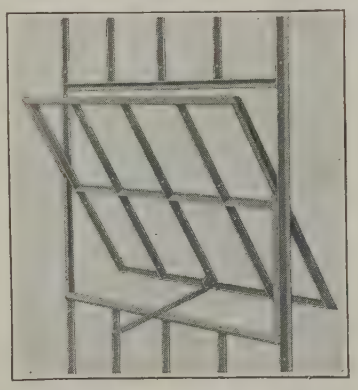
H Cam
Two used with push bars. Alternate for F lock bar at additional cost



Principal Bars
Full size sections

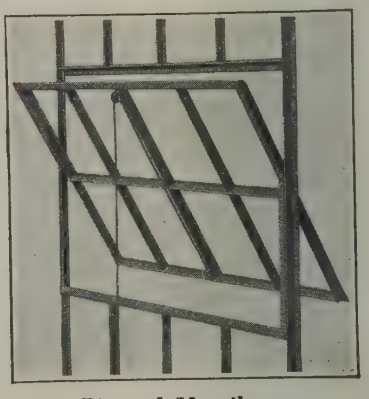


C Chain Catch
Made of steel, sherardized. Used when ventilators are high up

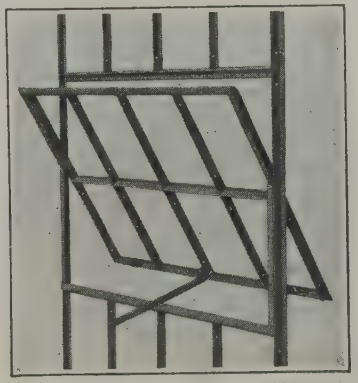


Pivoted Ventilator
F lock bar hardware—the most frequently used kind

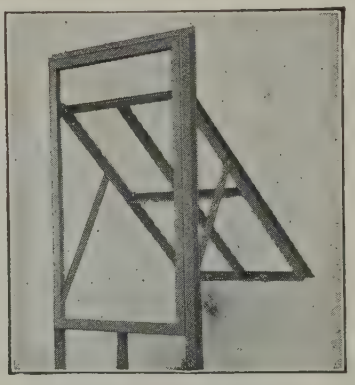
Intersection
Simple, strong, pleasing appearance. Bars not bent or manipulated in assembling, therefore, steel can be and is of strong character. Surfaces get-at-able for easy and complete repainting



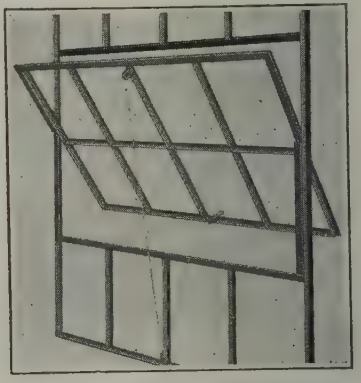
Pivoted Ventilator
Chain catch hardware—for use above reaching distance



Pivoted Ventilator
Push bar and cam hardware



Projected Out (PO) Ventilator
The kind here shown has many merits of other kinds and some individual ones. Users of steel windows may well give it careful consideration



Pivoted Ventilator
H15 cam latch and chain hardware

BAYLEY-SPRINGFIELD STEEL WINDOWS

Continued on next page

Ventilators—Horizontally pivoted. Have double weathering contact 1⅝ in. deep at sides and 1¾ in. deep at top and bottom.

Exceptionally strong and deep at top and bottom. Exceptionally strong and tight.

Paint—One shop coat of Bayley-Springfield standard red.

In Stock for Immediate Shipment—20 sizes in 14x20 glass and 19 sizes in 12x18 glass carried in stock. These are a selection of most popular standard units and are shown in heavy outline on drawings number 189 and 190 below. They are constructed the same as made-to-order windows and are carried in warehouse and by dealers.

Bayley-Springfield Utility Windows—In stock. *Made in one size* 3 ft. 4 in. wide by 3 ft. 7⅝ in. high. Standard Bayley-Springfield construction sections 1½ in. and 1⅝ in. deep, 3 lights wide and 2 lights high—top 3 lights ventilated.

Paint—Bayley-Springfield Utility Window gray. Ideally adapted for small structures such as garages and similar buildings.

F Horizontal Mullions—Usually not furnished by this company. Made of structural materials and permit using one unit above another for power houses, etc.

Bayley-Springfield Economy Inserts (Patented)—Are formed galvanized iron, providing recesses in jambs and heads of openings in which steel windows are to be installed. They are designed for use in buildings constructed of re-inforced concrete.

Economy Inserts simplify and hasten erection which lowers the cost of steel window installation by reducing the number of operations. They improve the quality and increase the durability of the work by forming a perfect bond between the window frame and wall.

Economy Inserts entirely eliminate the necessity of pointing. They permit window sash installation in all kinds of weather. They improve the appearance and make possible easy and economical replacement of windows, when for any reason this is necessary. It is in the economy of the operation that they have their greatest appeal. "Erecting windows" is a quicker operation when Economy Inserts are used. Economy Inserts promote permanent tightness. Pointing required in the old method is done with a mixture which differs from that used in making the walls of a concrete building, and it is applied after the walls have hardened. Economy Inserts save time and materials and promote efficiency in the use of any standard make of steel windows.

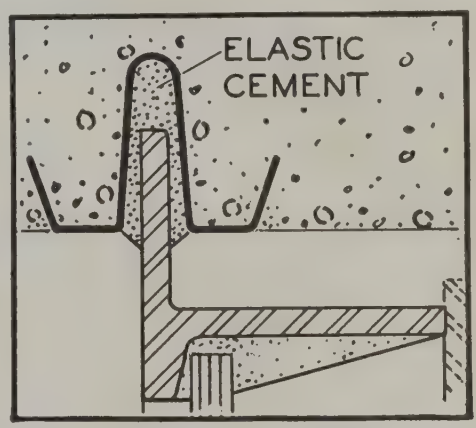
Complete instructions are sent with the shipment, showing how Economy Inserts should be used by the contractor and how the window erection should be done.

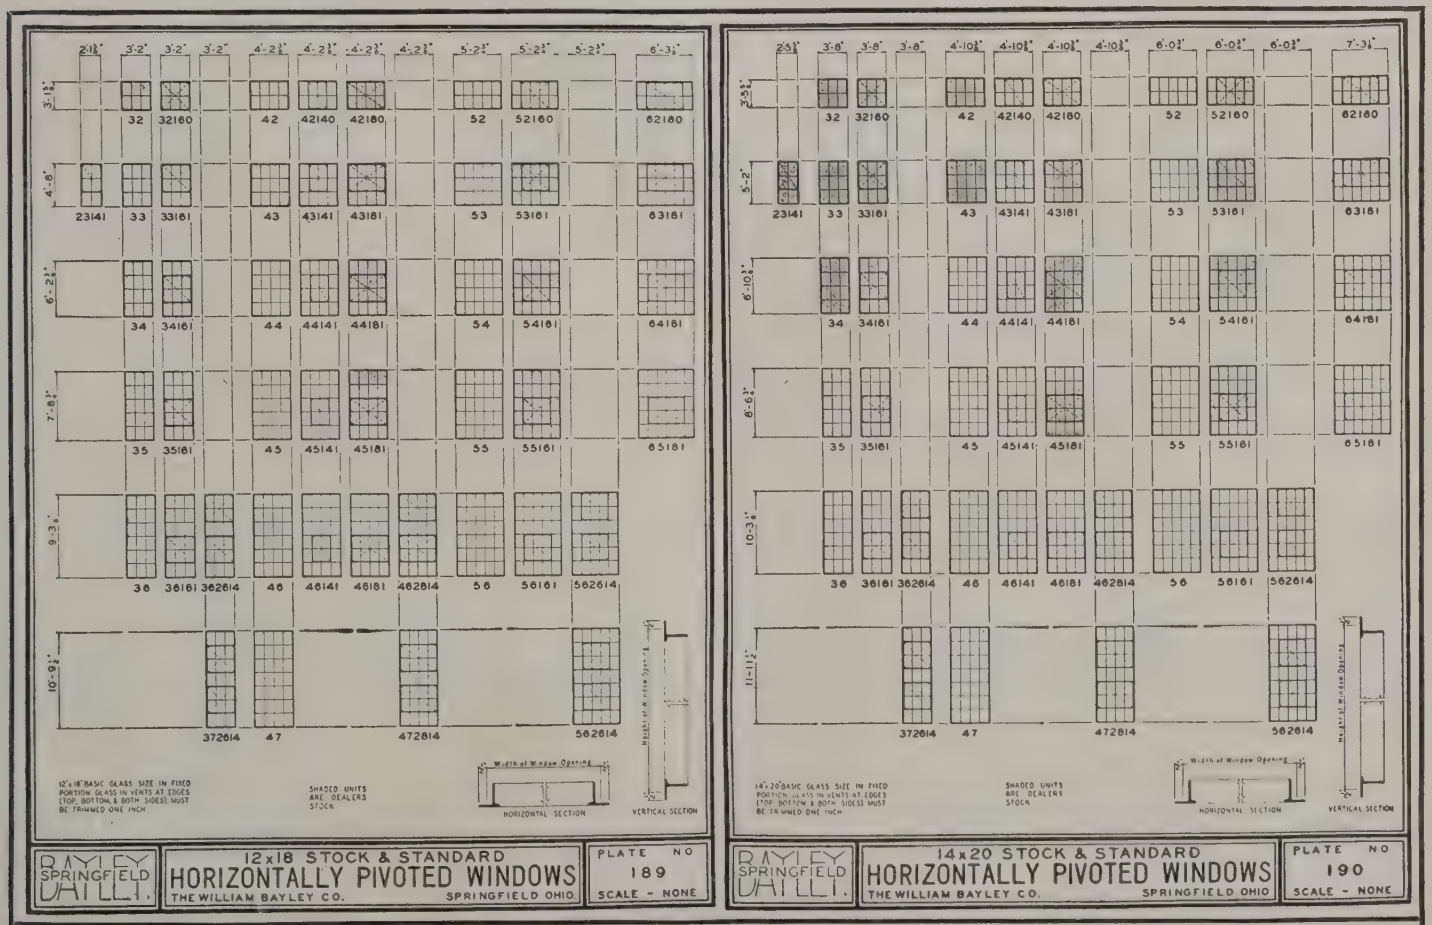
Architect's Specifications—Economy Inserts, made by The William Bayley Co., Springfield, Ohio, are to be provided for both jambs of all openings requiring more than one unit, and for all heads.

Right

Full Size Section Economy Inserts with Sash Installed

This less expensive method eliminates leakage and corrosion where sash frame enters wall. Ventilators operate freely and close tightly





BAYLEY-SPRINGFIELD STEEL WINDOWS

Continued on next page

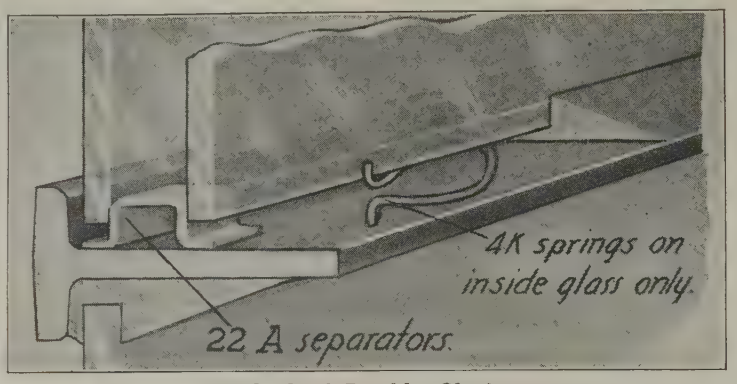
Anchorage—Secured in masonry openings by embedding the outside frame member in cement fill, or by the use of Economy inserts. Windows may be clamped to structural steel by use of clips and bolts which are furnished when specified. Type of head, sill and jamb must be stated.

When Writing for Quotations—Avoid delay by giving complete information as follows:

Type of units; number of units; number and kind of mullions, if any; kind of hardware (lock bar, push bar and 2 cams, chain catch). If chain catch hardware is desired give distance from sill of window to floor. If to be installed in structural steel (anchors consequently required), state where anchors are needed. State when shipment is required.

Quotations — Cover window units complete with or without ventilators as specified. M mullions as required, with necessary clips and bolts, F lock bars (1 to each ventilator), 4K glazing springs (4 to each light), and (only when specified) 3A or 66A clips spaced about 2-ft. centers for attachment to structural steel.

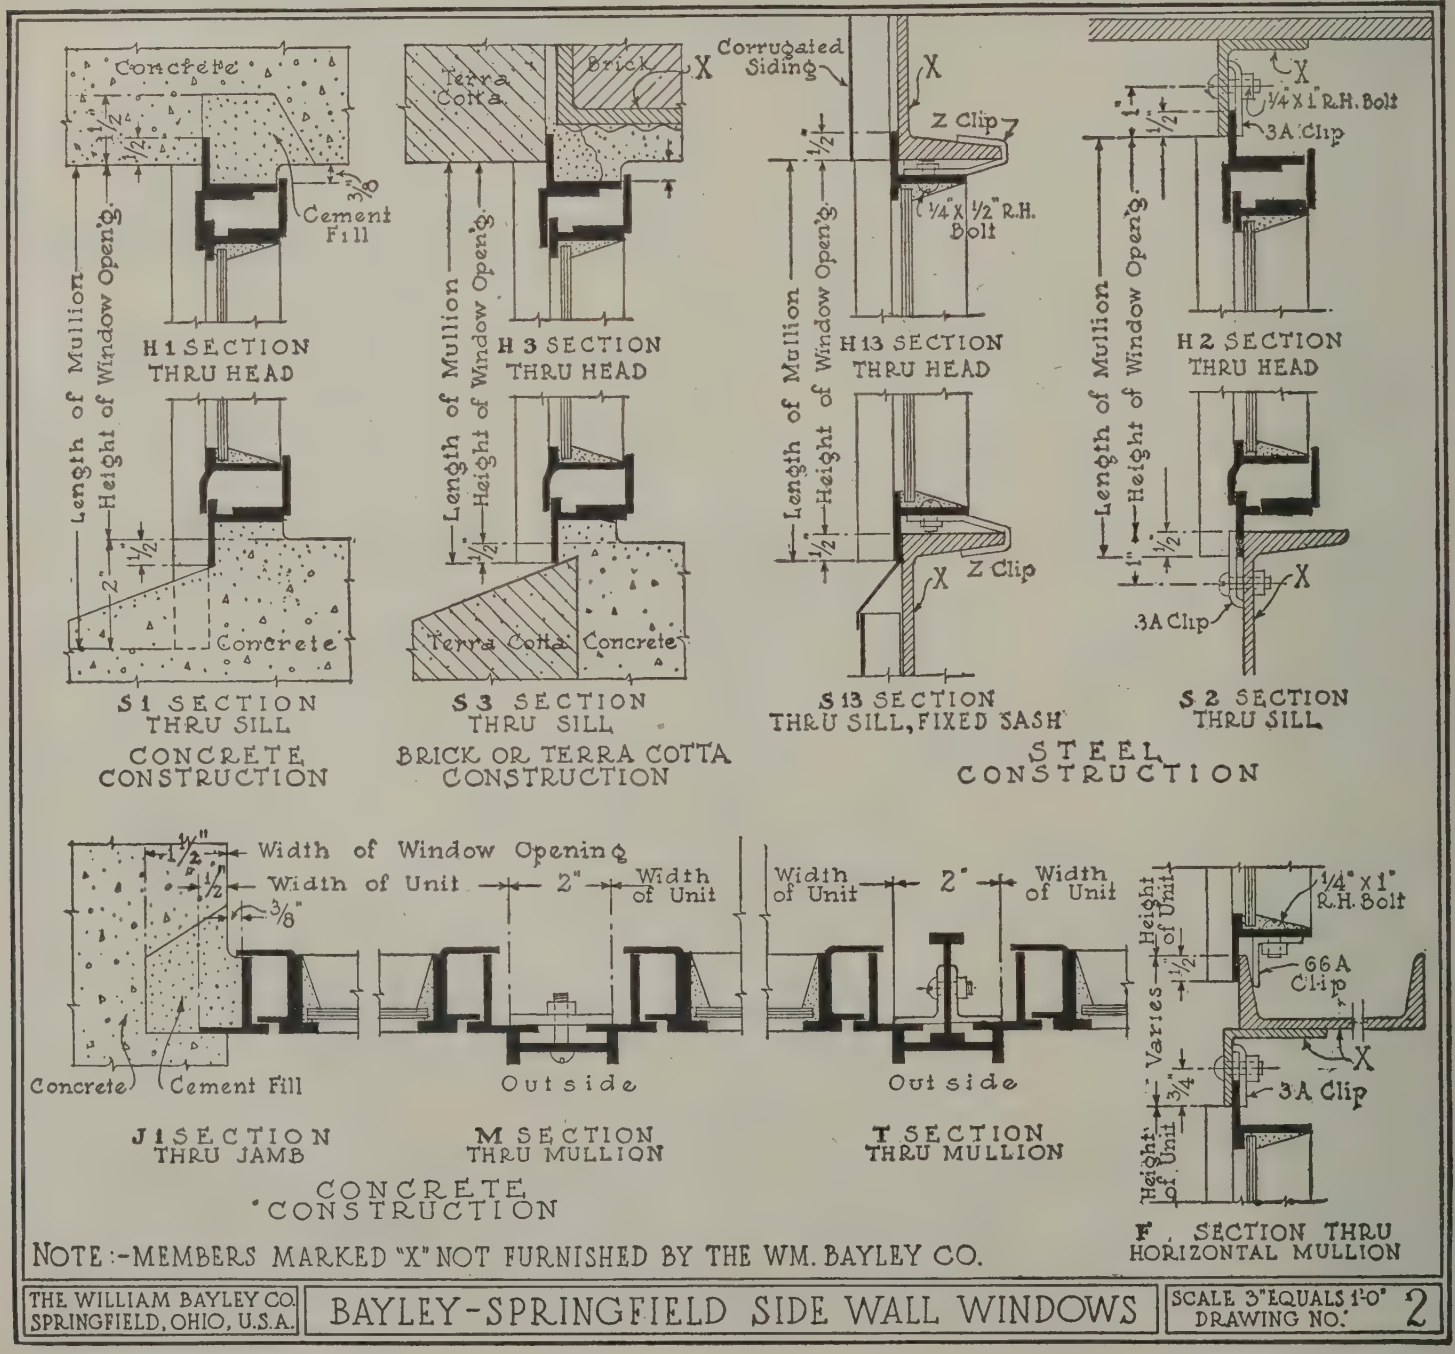
Quotations do not cover (unless specifically stated) structural materials and parts not established and standardized as parts of steel windows and recognized as such in the practices of the trade, glass, putty, erections, glazing or other labor, etc.



Method of Double Glazing

Double Glazing—As a means of promoting comfortable living conditions in summer and conserving heat in winter, is effectively provided for in Bayley-Springfield.

The excessive depth of the bars admits of sufficient dead air space between two panes of glass and entirely eliminates objectionable features.



Continued on next page

Bayley-Springfield Projected Ventilator Windows

Ventilators balance on pivoted arms and simultaneously move down and out, or up and in, sufficient friction being provided to hold them in any desired position. Sliding mechanism parts are of brass.

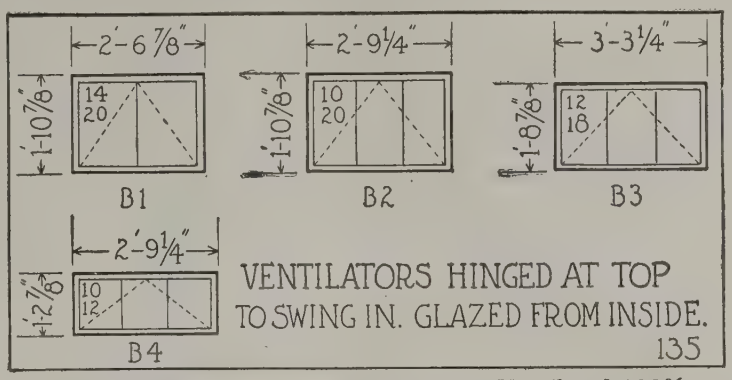
Bayley - Springfield Projected Windows, Commercial — Are a highly standardized manufactured product, the merits of which have produced a demand sufficient to permit quantity production and, with it, high quality and low cost.

For standard layouts see Drawing 170 below.

For sizes use dimensions of corresponding units on second preceding page.

Bayley-Springfield Projected Windows, Architectural—Are an extremely high grade product at a surprisingly moderate cost. They are of layouts shown in drawing 191 and incorporate such structural and quality features as welding of corners of both ventilators and ventilator openings, glazing stops, solid bronze hardware and preparation for attachment of shade brackets.

These windows lend themselves readily to screening and may be prepared for steel screens at but slight additional cost.



Bayley-Springfield Basement Windows—Ventilated 100%

Immediate shipment. Masonry openings and glass sizes, see drawing No. 135. Have a heavy stiff frame. Have a strong ventilator with 1½ in. deep muntins. Easily removable and replaceable. For use in wood, brick, concrete or tile. Inexpensive, cost no more than wood.

Bayley-Springfield Continuous Windows and Continuous Window Operators

For Roofs and Sidewalls

Constructed of specially designed solid rolled steel sections welded together for strength and permanency. The sill member is of a new design having no pockets for water or ice in either the open or closed position, at any useful angle. It has an integral flange for operator attachment and a flat-surface contact with the structural steel and its shape is such that a condensation gutter of effective size and form may be used where advisable. Hinges, at 4-ft. centers, placed inside of steel framing for protection, are of heavy steel with ⅜-in. brass pins and have slotted holes for adjustment to steel work. Vertical bars are spaced at 2-ft. centers. Putty-bed on all members is in the same plane which facilitates glazing, requires less putty and reduces glass breakage. Where panels are joined the splice is placed at the center of glass space, and fully develops the strength of horizontal members. Vertical weathering, where hinged portions meet fixed panels, is of formed galvanized steel. Hinged windows have fixed panels 1 ft. wide at extreme ends of lines and 2 ft. wide at intermediate ends. All steel is given one dip coat of standard red oxide paint.

Over-all length of windows should be held to full feet in order to use stock and insure quick shipment. Variations from full feet to be taken up with flashing by others.

Storm panels are not included but are furnished at extra cost when specially ordered and fit inside the 3-in. clearance space with provision to drain water outside. Glass in storm panels is of same size as glass in main part of line.

Wire glass ¼ in. thick is recommended and must be 23½ in. wide, except in end panels, set in an even bed of putty struck flush with outside surface of glass and held by galvanized metal clips and bolts. Face putty may be used at extra cost.

Continuous Window Operators—Are of the tension type or rack and pinion type. They may be either manually or electrically controlled. Lengths of lines are determined by conditions of the installation. In general, tension type is used for long lines and rack and pinion type used for short lines. This product is of sturdy construction and good quality. Parts are designed to eliminate friction and include such features as machine-cut racks, pinions, worms and gears; bronze or ball bearings, where necessary; and provision for working parts to run in oil.

Items Not Furnished—The William Bayley Co. does not furnish structural steel, all flashing and condensation gutters, glass, putty, erection, pointing, field painting and glazing, unless specifically mentioned in the contract.

Bayley-Springfield Steel Doors

Primarily for use in industrial buildings. Parts heavy enough and details strong enough to insure continued, satisfactory working under rough and abusive conditions of service. Outer members are thick walled steel tubing. Filling is made of steel window shapes. Usually glazed in the upper portion and provided with a steel plate in the lower. Some are made with steel plates in both portions. Tube corners are reinforced (see BEB below) for strength and along the miter lines to hold the metal heated to fluid condition during the welding process. Plate is flanged on four edges and stretched during riveting so that it is free from buckles and serves as a truss.

Frames for hinged doors are usually channels and contemplate the sills being of concrete. Send sketches of openings for recommendations. Frames for sliding doors usually not required.

Architects' Door Specifications

The standard of quality adopted for the steel doors is that established by The William Bayley Co., Springfield, Ohio, in the manufacture of Bayley-Springfield steel doors, and bidders are required to base their proposals upon the use of this Bayley product.

"Any bidder may submit an alternate on another make of steel doors, but in doing so must give the name and address of the manufacturer, together with evidence that the product is equal to the adopted standard in strength, permanency, design, finish and workmanship."

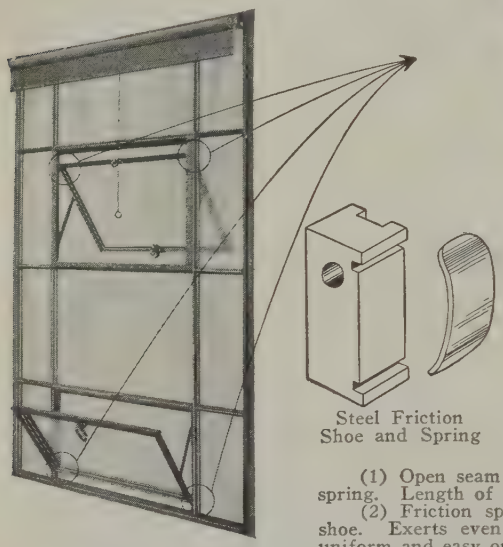
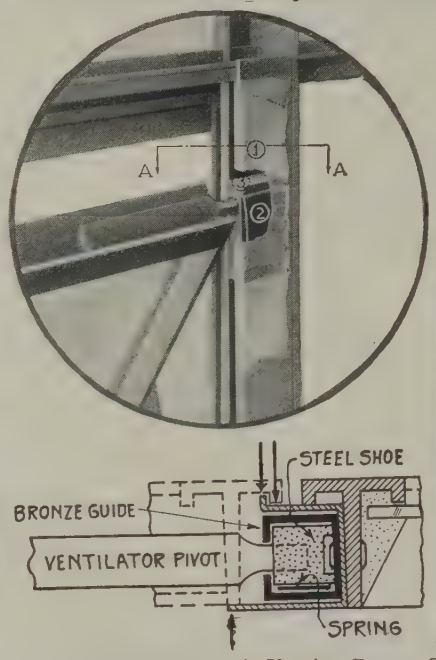
Boca Architectural TS Projected Windows

THE BOGERT & CARLOUGH CO. have done much to popularize the projected window by the introduction of the patented Boca Bronze Ventilator Guide—an exclusive feature. This guide contains a steel friction shoe and spring which gives free and uniform operation of the ventilator at all times and holds it open at any desired angle. This device requires neither paint nor adjustment and always functions with ease.

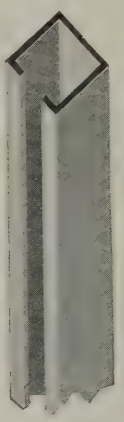


Boca Architectural TS Projected Window with Open-out and Open-in Ventilators

Steel Friction Shoe and Spring



Section Through A—A Showing Bronze Guide and Three-point Weathering



Bronze Guide

Boca Bronze Guide

(1) Open seam rectangular bronze guide. Contains steel friction shoe and spring. Length of guide about two-thirds height of ventilator.

(2) Friction spring. Specially tempered. Designed as part of the steel shoe. Exerts even pressure against inside of bronze guide (1) and insures uniform and easy operation of ventilator.

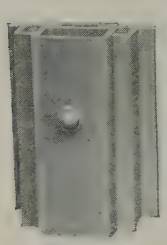
(3) Steel friction shoe. Slides within bronze guide (1) with action of the ventilator and holds it open at any angle by friction. Ventilator pivots on steel pins, at either side, riveted in position and extending into the friction shoe.

(A—A) Three-point weathering member. Continuous contact at sides of ventilator is obtained by special formed channel engaging jamb member of ventilator when closed

It overcomes the ordinary difficulty with projected windows caused by paint and by the slides binding and sticking.

Another exclusive feature is the three-point continuous weathering contact at sides of ventilator. It is obtained by use of special steel weathering channel shown in section A-A.

Specifications—Architectural Projected Windows shall be Boca (type TS) as manufactured by THE BOGERT & CARLOUGH CO., Paterson, N. J.



TS Vertical Mullion

Window bars shall be made of solid rolled steel members and where interior muntin bars cross, they shall be joined by a rigid interlocking joint, giving a flat exterior surface. Outside frame member of windows shall be an unequal leg channel section.

Ventilators—All ventilators shall be of projected open-out or open-in type. They shall be equipped at sides with the special Boca open seam rectangular bronze guides, riveted to frame, within which slide vertically a steel shoe and friction spring to assure smooth and uniform operation of ventilator.

The ventilators shall be supported on arms of spring steel riveted to sides and to brackets attached to window frame. All corners of frames and ventilators shall be riveted and welded and exposed surfaces ground smooth.

Hardware—All hardware shall be of bronze of window manufacturer's standard design. Ventilators within reach shall be provided with cam handle and where pole operated they shall have spring catch and pole ring.

Where two or more windows occur in the same opening mullions of tubular steel shall be furnished to join them.

Glazing angles held in place with brass barrel bolts shall be furnished for all lights.

Painting—All windows shall be given one dip coat of gray paint by manufacturer before shipment.

TS Vertical Tubular Mullion—

Consists of an exterior 2 in. steel flat and an interior 2x1½x$\frac{5}{16}$-in. tubular member.

This mullion produces an attractive vertical paneled interior effect and its heavy construction gives rigidity and durability. Double surface contact is had with the frame members of Architectural TS projected windows by a single line of bolts with bronze cap nuts.

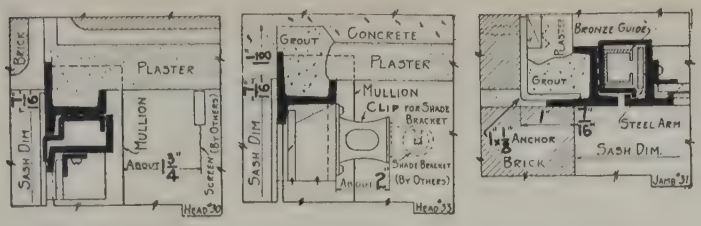
Types and Sizes of Boca Architectural TS Projected Windows

Widths and heights given above are wall opening dimensions.
Allow 2 in. for width of each TS vertical tubular mullion joining TS windows

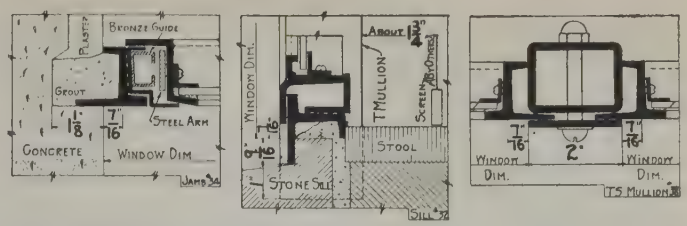
Continued on next page



Head No. 30—Standard for brick construction with steel lintel where plaster ceilings occur. Position of window screen indicated.

Head No. 33—Standard for concrete construction with plaster ceiling. Shade bracket clip shown and position of shade indicated.

Jamb No. 31—Standard for brick openings with interior plastered wall. Section indicates position of bronze guide for open-out ventilators.



Jamb No. 34—Standard for concrete walls with interior plaster. Section shows position of bronze guide for open-in ventilator.

Sill No. 32—Standard for stone sill. Sills must be cut to receive vertical mullions where they occur. Sills of concrete, terra cotta or brick are similar in detail. Position of screen indicated.

No. 38—TS vertical tubular mullion.

Installation Details of Boca Architectural TS Projected Windows

TS horizontal tubular mullions of the same design are furnished (only when specified) where two or more TS windows are placed one above the other in the same opening.

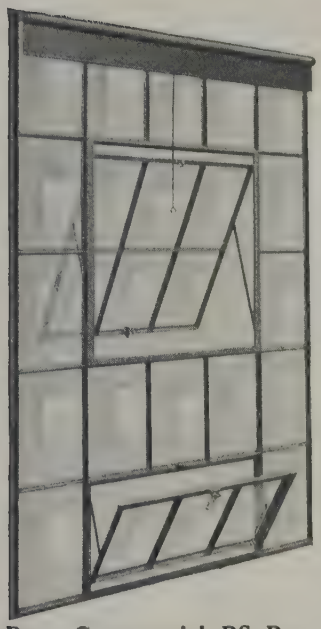
Screens—These are not furnished by window manufacturer.

For open-out ventilators of either Architectural TS or Commercial RS Projected Windows screens should be either metal side or top hinged or vertical sliding and provision made to clear window hardware.

For open-in ventilators metal outside screens either removable or fixed may be used.

Shade Bracket Clips or Supports—These are supplied at slight additional cost when specified, for Architectural TS Projected Windows. These clips are slotted to accommodate any standard shade bracket.

Boca Commercial RS Projected Windows



Boca Commercial RS Projected Window with Open-out and Open-in Ventilators

These windows are similar to the Boca Architectural TS Windows except that the outside frame member, hardware, types and sizes are different and the glazing angles are omitted. They also are equipped with the patented Boca Bronze Guide at sides of ventilators. These windows take 12x18 and 14x20 glass sizes. Ventilators may be open-in or open-out as specified, but no ventilators shall be more than three lights wide. The standard hardware is iron, but bronze may be substituted when specified. Tee bar mullions are used to join windows when two or more occur in an opening. Shade bracket clips will be supplied when specified.

Specifications — Commercial Projected Windows shall be Boca (type RS) as manufactured by The Bogert & Carlough Co., Paterson, N. J.

Bars shall be made of solid rolled steel members and where interior muntin bars cross they shall be joined by a rigid interlocking joint, giving a flat exterior surface. Outside frame member of windows shall be a special rolled steel T bar with 1 in. outstanding leg.

All ventilators shall be of projected open-out or open-in type. They shall be equipped at sides with the special Boca open seam rectangular bronze guides, riveted to frame, within which slide vertically a steel shoe and friction spring to assure smooth and uniform operation of ventilator.

The ventilators shall be supported on arms of spring steel riveted to sides and to brackets attached to window frame. All corners of ventilators shall be tenoned and riveted.

All hardware shall be of iron of window manufacturer's standard design (of similar design in bronze if specified). Ventilators within reach shall be provided with cam handle and where pole operated, with a spring catch and pole ring.

Where two or more windows occur in the same opening tubular steel mullions shall be furnished to join them. (If specified, Boca standard T bar mullions No. 37 shown at bottom of next page will be supplied instead.)

Glass shall be held in place by coppered steel glazing clips.

All windows shall be given one dip coat of gray paint by manufacturer before shipment.

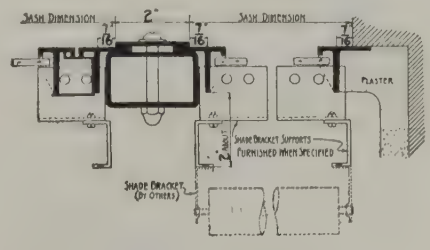
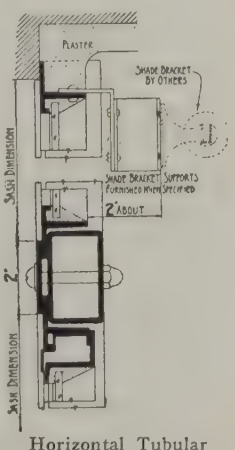
Open-out projected ventilators are indicated above by lines, thus ∧. Open-in thus ∨. Open-in ventilators will be furnished in place of open-out ventilators shown or vice-versa, when so specified, at slight additional cost.



Vertical Tubular Mullion

The vertical mullion is used where mullion width is 2 in. Consists of an exterior 2-in. steel flat and an interior 2½x1½x$\frac{3}{16}$-in. tubular member. Interchangeable with Boca standard tee mullion No. 37 shown on next page but costs slightly more.

The horizontal tubular mullion shown at the right is of the same construction as the vertical tubular mullion, and is used in conjunction therewith. Horizontal mullions furnished only when specified.

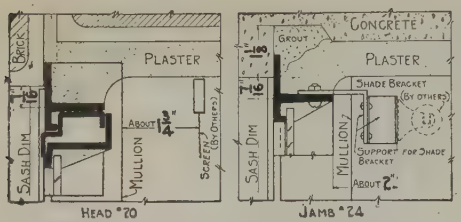


Horizontal Tubular Mullion

Boca Mullions for Commercial RS Projected Windows

These mullions have the same advantages as the mullions shown on preceding page. Note shade bracket support or clip (furnished only when specified) which consists of a small angle bracket and a channel extension.

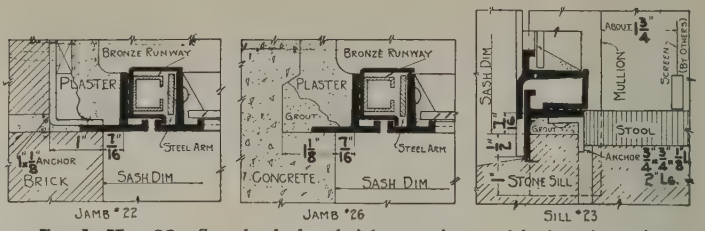
Continued on next page



Head No. 20—Standard for brick construction. Window held in position by anchors, if specified. Position of screen indicated.

Head No. 24—Standard for concrete construction. Location of shade and shade bracket support indicated.

Jamb No. 21—Standard for brick openings without interior plaster. Section shows bronze guide or runway for open-out ventilator.



Jamb No. 22—Standard for brick openings with interior plaster. Section shows bronze guide for open-out ventilator.

Jamb No. 26—Standard for concrete walls with interior plaster. Section shows bronze guide for open-out ventilator.

Sill No. 23—Standard for stone sill. Sills of concrete or brick are similar in detail. Position of screen indicated.

Installation Details of Commercial RS Projected Windows

Boca Horizontally Pivoted Windows

Specifications—Horizontally Pivoted Windows shall be Boca as manufactured by The Bogert & Carlough Co., Paterson, N. J.

All windows shall be made of solid rolled steel members and where interior horizontal and vertical muntin bars cross, they shall be joined by a rigid interlocking joint with flat exterior surface.

All ventilators shall be horizontally pivoted on external hinges and shall have double weathering contact at head and at sill and three-point continuous weathering contact at the sides.

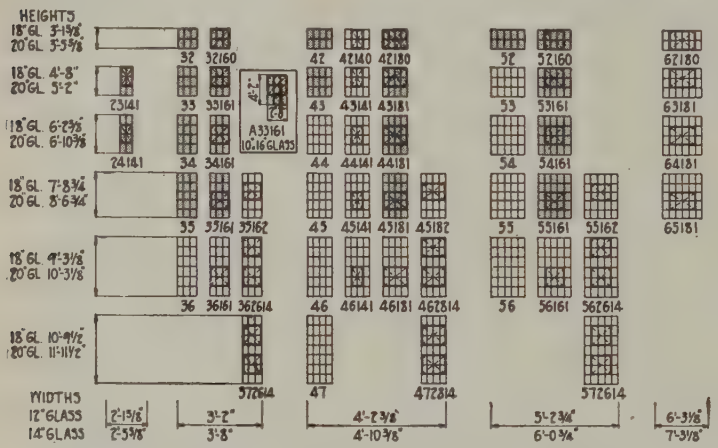
Interior View Boca Lock Joint

All ventilators shall be provided with steel stay bar with locking attachment (or—All ventilators shall be equipped with spring catch, roller bracket and chain except where mechanical operators are specified).

Where two or more windows are used in the same opening they shall be joined by vertical mullions of solid steel T bars.

Glazing clips of coppered spring steel wire and necessary clips and bolts required for installation of windows shall be supplied.

All windows shall be given one dip coat of gray paint by manufacturer before shipment.



Standard Sizes and Types of Boca Pivoted Windows

Types shaded are warehouse sizes carried in stock

Underwriters' Windows

Underwriters' windows are limited to 7x12 ft. either dimension being taken as height or width.

Multiple of sizes within the required dimensions may be used to fill any opening by using Boca T bar mullions bolted to windows and secured to lintel and sill.

Wire glass ¼ in. thick must be used, not over 14 in. in width and not over 48 in. in height. Total exposed glass area for any light must not exceed 350 sq. in.

Boca windows as listed below can be furnished with Underwriters' label at additional cost.

Standard sizes (see sizes and types on this page) and special sizes of *horizontal pivoted windows,* ventilators pivoted above center.

Standard sizes (see sizes and types on second preceding page) and special sizes of *Architectural TS Projected Windows* except those having one or more open-in ventilators. Additional muntin bars must be supplied in large lights necessary to meet glass limitations.

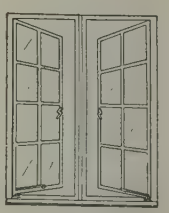
Standard sizes (see sizes and types, preceding page) and special sizes of *Commercial RS Projected Windows* except those having one or more open-in ventilators.

Note: Curved or splayed head windows will not be labeled.

Boca Steel Partitions

Constructed of regular Boca steel window units joined by mullions, with sheet steel panels in the lower sections. Built to meet the requirements of any building condition.

Boca Steel Casements



Made from Boca solid steel rolled sections; welded at corners.

Have 2-point weathering contact at all sides, and equipped with bronze hardware.

Easily installed in any type of wall construction — brick, stone, concrete, stucco or wood.

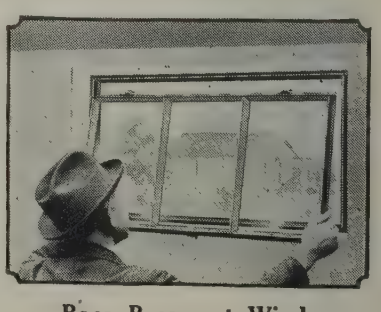
Offset hinges to permit cleaning from inside are standard construction.

Boca Steel Basement Windows

An exclusive Boca development. No hinges, no pins. Window easily removed from frame (from inside only) for cleaning or replacing glass.

Screw holes provided in frame for attaching screens. A special latch automatically locks window when closed. Made in the standard sizes.

Type	Wall openings Width	Wall openings Height	Lights glass
W1	2′ 9½″	1′ 3″	3–10″x12″
W2	3′ 3½″	1′ 9″	3–12″x18″
W3	2′ 9½″	1′ 11″	3–10″x20″
W4	2′ 7¼″	1′ 11″	2–14″x20″



Boca Basement Window

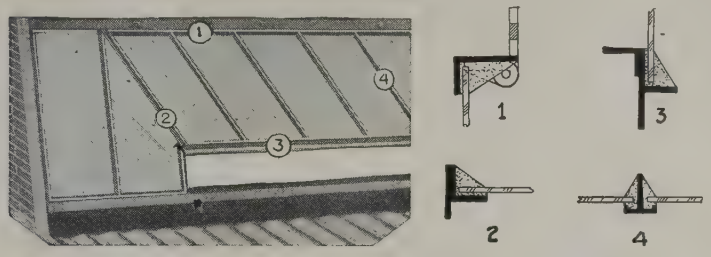
Continued on next page

Boca Continuous Windows

Top hung and fixed for monitor, sawtooth, A-frame, foundry and other types of roof, also sidewalls. May be placed either vertically or sloping.

Top hung operated with mechanical operators by arms attached to bottom rail.

Made of rolled steel members with all joints acetylene welded. Standard panels are 20 ft. long and 3, 4 and 5 ft. high. Special lengths of 10 to 18 ft. can be supplied. Clips are supplied for holding glass in place.



Weathering Features of Boca Continuous Windows

(1) *Top rail and hinge.* These weather back of girt angle at head of opening. (2) *End bar of panel.* Weathering flat used only at end of run. (3) *Bottom rail of window.* Closes against girt angle at sill forming weathering. (4) *Interior muntin bar.* Tenoned to top and bottom rails

Boca All-steel Doors and Frames for Economy

Offer decided advantages over wood doors, including simplified fireproof construction and worthwhile economies in installation and maintenance.

Made of special Boca section with corners welded, and with copper alloy sheet riveted in lower portion.

Finished in one coat of gray paint. No glass or putty included.

Double Doors—Complete with 4-in. steel channel frame at jambs, head and sill. Shipped in four pieces: 1 head channel, 1 sill channel and 2 doors with jamb channel and hinges attached.

Hardware consists of foot bolt, chain bolt, automatic door holders, Yale rim lock and handles.

Two styles, swing and slide.

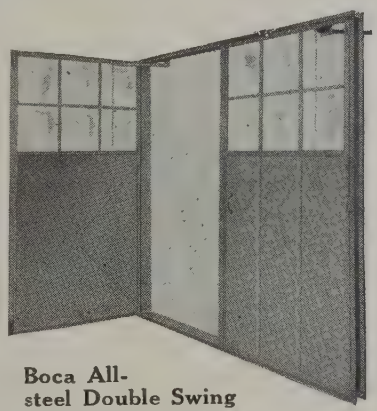
Swing doors are made in three sizes to fit wall openings 8 ft. wide, 7 ft. 6 in. high; 8 ft. wide, 8 ft. high; and 9 ft. wide, 9 ft. 6 in. high.

Net price $50.00 for the first two sizes and $78.00 for the largest size.

Slide doors are made in one size, without frame, to fit wall opening 9 ft. 9 in. wide, 9 ft. 10½ in. high, and are complete with overhead track, hangers, hasp and staple, foot bolt, handles and bottom guides.

Net price $98.00.

Boca All-steel Double Doors are recommended for commercial buildings and for battery garage construction. The 4-in. steel jamb channels bolted together serve as posts to support roof and eliminate brick or concrete piers.



Boca All-steel Double Swing Doors and Frame

Single Doors and Frame—Similar construction to double doors.

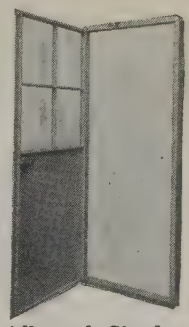
Shipped in one complete unit, consisting of door, 3-in. steel channel frame, cylinder rim lock and handles.

Appropriate for use wherever fireproof door construction is required.

Made for two sizes of wall openings, 2 ft. 8 in. wide, 6 ft. 8 in. high; and 3 ft. wide, 7 ft. high.

Net price $33.00 and $38.00, respectively.

All above prices f. o. b. Paterson, N. J.



All-steel Single Swing Door and Frame

Single Swing Door

Boca Tubular Steel Doors

For commercial and industrial buildings or wherever steel doors with glass panels are required.

Hinged doors are complete with standard handle, knob and bronze lock; sliding doors with standard bow handle, foot and chain bolt, hasp and staple and overhead track and hangers.

Standard sizes of single swinging doors given are inside dimensions of steel channel door frames. For single sliding and double sliding doors, the standard sizes given are 2 in. wider and 1½ in. higher than the actual door opening to provide for overlap at head and jambs.

CAMPBELL METAL WINDOW CORPORATION

Pershing Square Building, NEW YORK, N. Y.

BALTIMORE, MD., Bush and Hamburg Streets

Campbell Solid Metal Windows

Model No. 26-W Double Hung—All parts of the sash and frame, as indicated on detail drawings, are formed of No. 12 gage blue annealed steel, the balance of No. 16 gage. Sash weights are single-unit castings. Chains are of steel, hot galvanized, with galvanized connectors to sash and weights. Rubbing strips are on each jamb at ends of meeting rails. Screws are of steel with standard 10-24 machine thread and heads as detailed. Cast iron sills and stools furnished for this model, if desired.

Model No. 25-W Double Hung—Materials entering into the construction of Model No. 25-W are essentially the same as described for Model No. 26-W with the exception that the sash members are made of No. 14 gage steel and parts of the frame (as indicated on detail drawing) are formed of No. 20 gage blue annealed steel; staff bead of No. 12 gage steel. Sills are of No. 12 gage drawn steel.

Assembly—Sash frames have mitered and welded corners. Glazing stops are mounted with screws on interior. Members forming jambs and head boxes are welded together. The frames are shipped with sash, pulleys and chains installed.

Weathering—Sill, meeting rails and head are fitted with metallic flexible weather stops. Vertical guides and sash members are fitted with metallic flexible interlocking weather stops within the boxes.

Guarantee—The amount of infiltration of air through standard double hung windows is guaranteed not to be more than ½ cu. ft. of air per foot of sash perimeter per minute when subjected to a static air pressure equivalent to the pressure exerted by a wind of 25 miles per hour.

Adjustment—Sash have concealed adjusters to prevent sash members from rubbing on exposed face of jambs and scraping paint.

Finish and Hardware—All steel in windows, except inside glass stops and inside cover plates, is galvanized after fabrication.

All finish hardware is solid bronze, polished and unlacquered.

Labels—Where required, windows are made in accordance with the regulations of the National Board of Fire Underwriters and bear their label.

Bronze Windows

All types are made in bronze if desired.

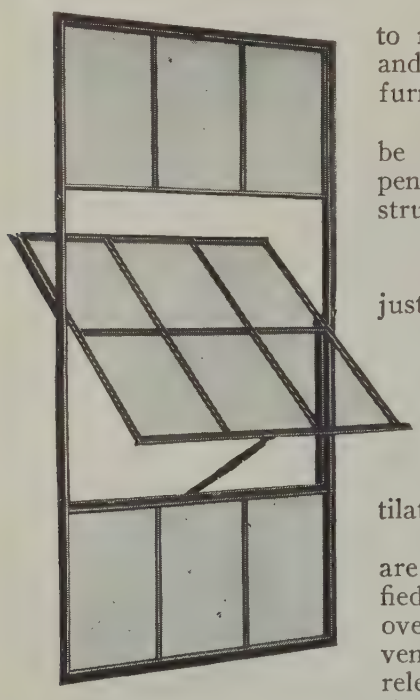
Crescent Pivoted Windows

Constructed of moulded 1⅜-in. deep sections, with interwoven muntin bars and all cross joints welded, making a rigid, strong and neat appearing window.

T-Bar Mullion—

Two or more units of Crescent Pivoted Windows may be combined in the same opening by joining them with a T-Bar mullion.



All units are punched to receive these mullions and bolts and nuts are furnished.

Stem of mullion may be turned out or in, depending upon the construction of the building.

Hardware—

Push bar sash adjuster is supplied as standard. When closed, this bar acts as a lock, holding the ventilator tight, and when open the bar is notched to hold ventilator at various positions.

Cam latch and chain are supplied when specified. The chain extends over a pulley at the top of ventilator. A slight pull releases cam lock and at the same time pulls ventilator open. A clip is furnished for holding the sash open.

Ventilators are pivoted 2 in. above center by means of heavy $\frac{3}{16}$-in. steel butts, with special pivot bolt for ventilator movement.

Each half of butt is solidly riveted to sash and ventilator member, these rivets passing through weathering sections. When closed, the weathering section of ventilator overlaps weathering section of the frame, insuring continuous double contact. Special head bar adds rigidity to the ventilator.

Glazing Clips—

Crescent Windows are glazed on the inside. First the frame is bed-puttied, then the glass is set in place and the glazing clips are placed, one at top and bottom of each side. These hold the glass securely while the putty is applied and provide a constant anchor for the glass. The clips are covered by the putty.

Crescent Projected Windows

Both the Commercial and Architectural types have ventilators that slide in channel and project out or in and are used where something better than the horizontally pivoted type windows are desired.

This type of window has become very popular for offices of factory buildings, and is also used in offices, schools and various other buildings.

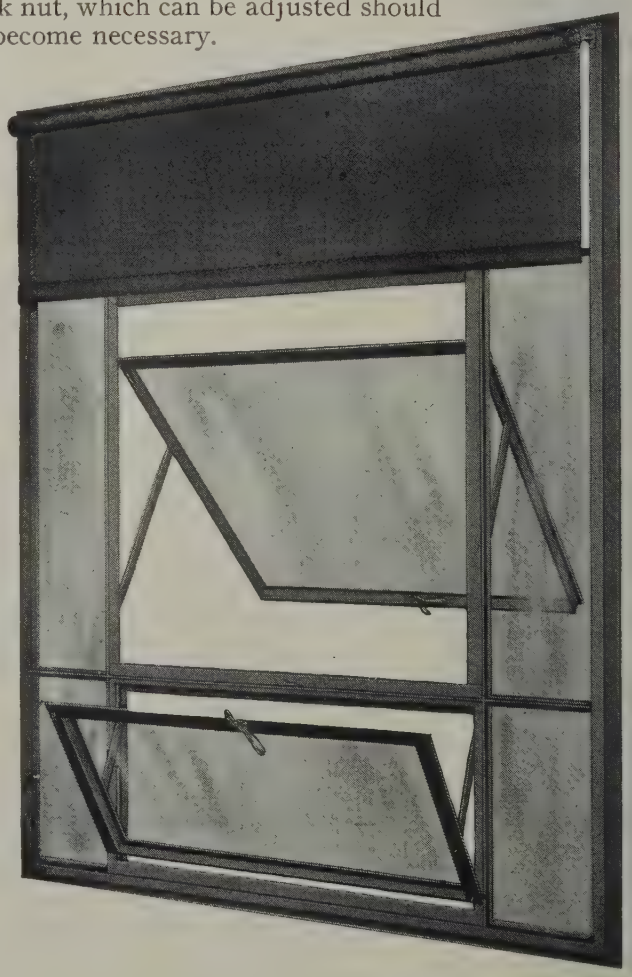
The ventilator is pivoted at top and swings out from the bottom, with no part of the ventilator extending into the interior of the building. The ventilator may be reversed making it easy for washing.

The ventilator may be opened a few inches at the bottom, without any movement from the top, and this is especially desirable for ventilation on rainy days.

The sections used in Commercial Projected Windows are the same as used in the construction of pivoted windows, and erection details are the same as for horizontally pivoted sash.

The ventilator is fastened at the top to sliding brass shoes. When the ventilator is pushed out from the bottom, these shoes slide down in the channel, the upper portion of the ventilator remaining in the same plane as the sash, while the lower portion of ventilator swings out and then upward after it has reached a horizontal position.

Adjustment in operation of the sash can easily be made, as the ventilator is attached to shoe by bolt and lock nut, which can be adjusted should it become necessary.



Continued on next page

Side arms support the ventilators when open, and when the ventilator is closed these are out of sight, as they are covered by the channel and ventilator section.

Screens and shades may be easily attached, as the ventilator does not project on the inside.

Architectural Projected Windows have a special heavy channel frame section, with all corners of frame and ventilators welded. Glass is held in place by means of glazing angles. Bronze hardware is furnished as standard on this type window. Complete specifications shown in our catalogue.

Underwriters' Labeled Steel Windows

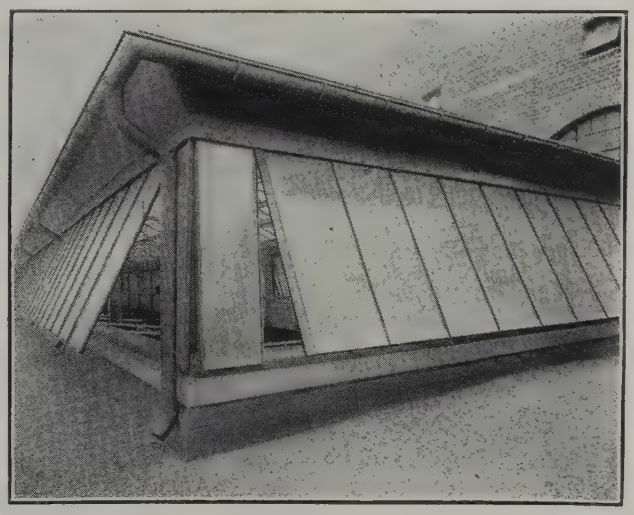
Can be furnished in horizontally pivoted, projected swing out and basement types. These types can only be furnished in sizes and within limits as designated by Underwriters' Laboratories, Inc.

Continuous glazing angles, eliminating bolts and nuts in horizontal members of Crescent Labeled Windows reduces the time and cost of glazing our windows. Corners of glazing angles are mitered giving a neat appearance. Complete data on sizes, limits, and where labeled windows should be used, shown in our complete catalogue.

Crescent Continuous Steel Windows

Furnished in top hung, center pivoted and fixed types. This type of window is commonly used in monitors and moveable types must be operated with mechanical operators. They serve a definite purpose in ventilating foundries, etc.

These windows are usually made in 3, 4, 5 and 6-ft. heights and any length made up to 20-ft. panels, joined together with expandable mullions. Storm panels, when required, are furnished at end of runs. See catalogue for details.



Steel Doors

Fabricated of tubular stiles and rails, with corners solidly welded and reinforced at all necessary points. Can be furnished in swinging, sliding or folding types in standard sizes.

Lower portion of door is a plate while upper section is a steel window with glazing angles for holding glass in place. Suitable hardware is furnished with each door.

Mechanical Operators

For operation of various types of windows in torsion, tension and rack and pinion types.

Torsion and rack and pinion types are used on horizontally pivoted windows. Tension type is used on continuous windows. Complete catalogue on operators

Crescent Casement Windows

Crescent Casements have been designed to fill the demand for a low priced yet satisfactory steel window for the home. The design and bars used have been proven to be the best for the purpose where weathertightness, architectural beauty and general utility are considered. The many thousands of homes now being equipped with steel casement windows, the general satisfaction obtained by the users, and their favorable cost, have built up a market of large proportions. Corners of frame and ventilators are riveted and then welded, making practically one-piece units. Welds are ground smooth.

Ventilators are hinged on either the right side or left side. A right-hand casement is such that when the window is viewed from the outside, has its hinges on the right-hand side. A left-hand casement, when viewed from the outside, has its hinges on the left-hand side. Please be sure to specify on which side the casements are to be hinged.

Hinges, such that windows can be easily cleaned from the inside, are standard equipment on Crescent Windows. Solid brass pins are used to eliminate any danger of corrosion and binding.

Malleable cam locks are furnished as standard. Bronze cam locks are furnished at a slight extra cost. All ventilated units are equipped with our No. 61 automatic casement stay. Standard punching will accommodate thumb screw adjuster, as well as underscreen hardware.

Spring wire glazing clips, for holding the glass in place, are furnished at no extra cost as well as anchor clips for anchoring the windows in the masonry.

Vertical and horizontal mullions are $1\frac{1}{2}$x$1\frac{1}{2}$x$\frac{1}{4}$ in. T-Bars securely fastened to units by bolts passing through frame sections and mullions.

Crescent Basement Windows

Made in four standard glass sizes, with extra heavy channel frame and ventilator bars. No formed-up weathering is used on our basement windows. Ventilators are double weathered. Screw holes are provided for attaching screens. Removable brass hinge pins eliminate corrosion and binding at wearing points. Clip lock and glazing clips furnished with each unit.

Experience

Since the foundation of the factory, *over 50 years ago,* the constant aim has been to utilize that long experience to produce a window that cannot be surpassed.

Literature

Literature and full size details of all products sent upon request.

De Pett Standard Casements—100 Series

Furnished with muntins or for leaded glass.

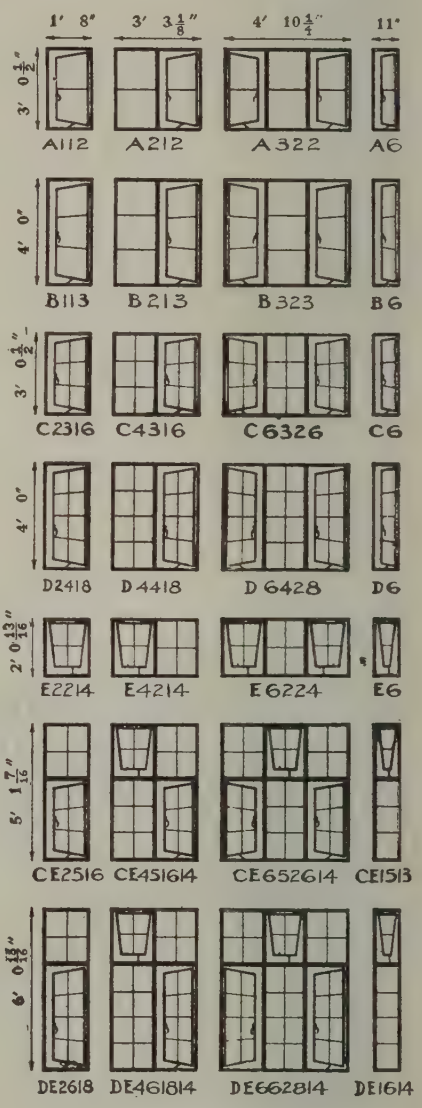
De Pett Casements are arranged for coupling together by means of our heavy mullion and transom bars specially designed to afford double weathering and rigidity, neither of which is secured when T-bars are used for this purpose. This feature enables the use of these windows in large openings, even when exceptional wind pressure must be provided against.

Sections—Solid steel, rolled from new billets of rust resisting quality, hydraulically straightened and especially designed to meet the requirements of rigid construction.

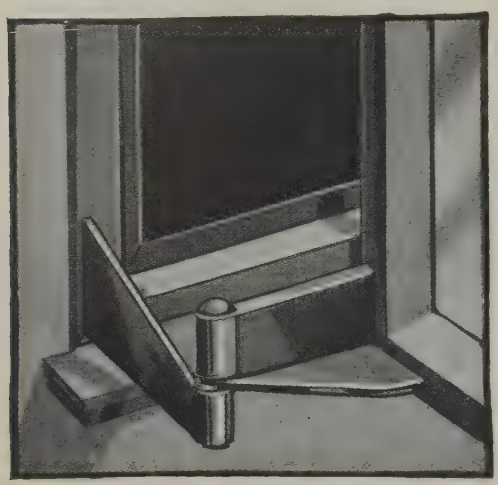
Construction — Two-point weathering contact. Cross joints of glazing bars are locked to avoid cutting away the strength of the bar at the joint and to give a distinctive appearance to the window. All corners are tenoned by specially designed tools, machine riveted, and then welded solid. All contacts polished smooth. De Pett precision in fabrication results in perfect contact at every point, insuring weatherproof casements.

Hardware—3-point solid bronze handle. Bronze sliding adjusting stay. Extension hinges, permitting cleaning the window from the inside.

Carried in Stock—De Pett Standard Casements are carried in stock for immediate delivery.



Type and Sizes of Casements—100 Series



Standard Extension Hinge

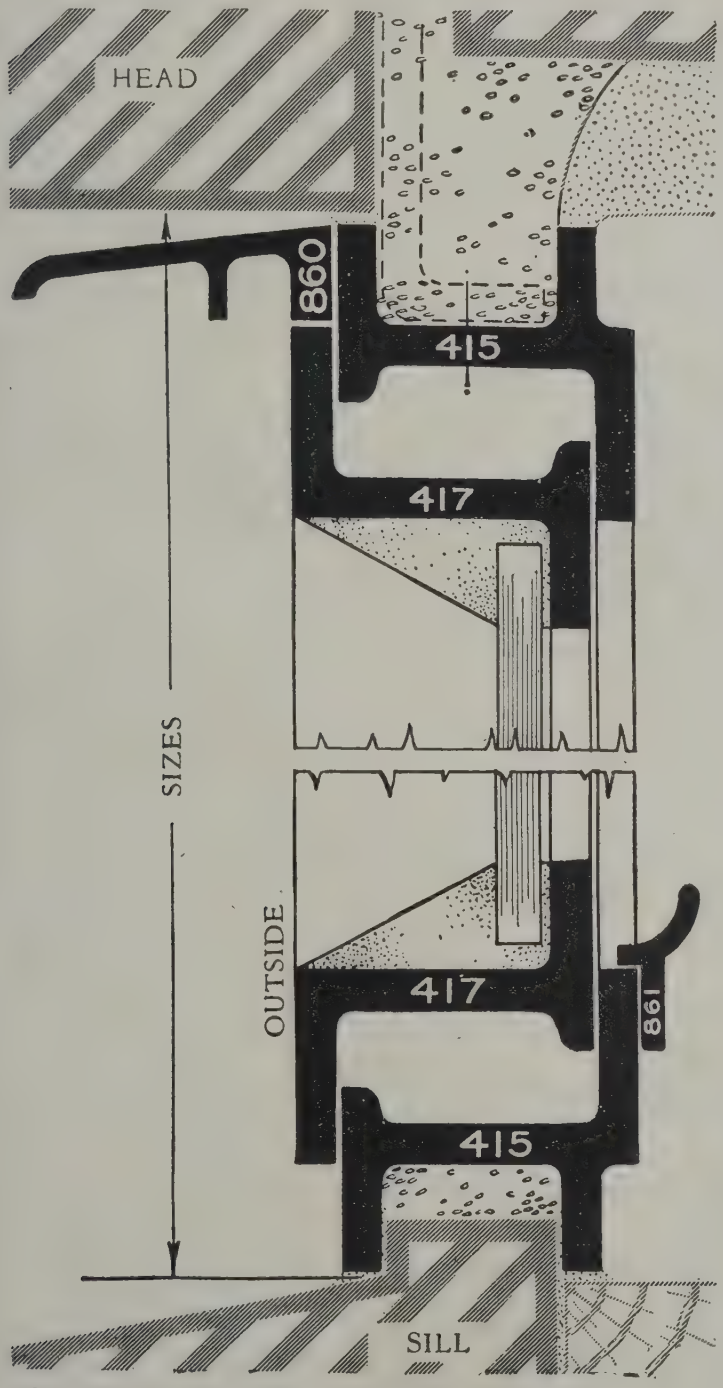
Continued on next page

De Pett Casements—400 Series

This series embraces side hung or pivoted casement windows for better class residences, banks, clubs, public buildings, churches, etc., projected windows for hospitals and schools, double glazed windows (either side hung or pivoted) and casement doors.

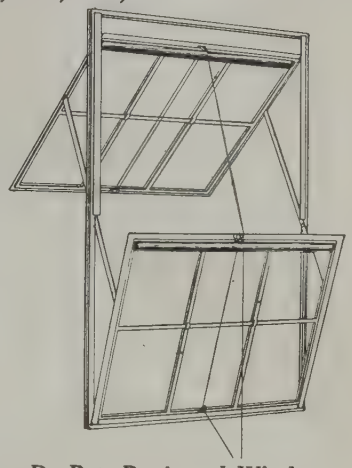
De Pett Casement Windows in the 400 Series afford an architectural effect not possible with lighter weight sections. The appearance of both fast and opening positions is identical throughout. Whether opening or fixed, the sight lines of all windows are exactly similar and the glass is in the same plane. Hinges are of solid bronze, of unusually substantial design.

De Pett Pivoted Casements are hung on our special solid brass, machine turned pivots of large diameter. They are formed with two ribs on the outside of each part designed to prevent any thrust on the screws that hold them in position, and at the same time these ribs both afford weather protection to the joints and avoid interruption of the architectural lines of the window. The bars to which the pivots are fixed are machined from solid, continuous sections, instead of being formed by reversing and welding two bars together. The weathering is solid with the frames and not obtained by the use of welded or screwed beads or strips.



Cross Section Side and Top Hung De Pett Casement—400 Series

De Pett Projected Window (Manufactured under U. S. Patent No. 1,643,042)



De Pett Projected Window

The ideal window for hospitals and schools. All sections are specially designed for this type of window. Ventilation is regulated by friction arms through sections sufficiently wide to guarantee rigid construction of all working parts without impairing the weathering. Fittings are entirely interchangeable and have bronze working parts throughout. Lower sashes are fitted with one pair of handles for opening and lever pattern handle and bridge for closing.

De Pett Double Glazed Casements (Patent Applied For)

For church work or any purpose where double glazing is required for protection or architectural effect as, for instance, where wire glass is required by fire laws yet it is desired to conceal same. Full details gladly furnished on request.

De Pett Casement Doors

All De Pett Casement Doors are made in 400 Series sections as we are unable to recommend a lighter weight section for doors. Standard doors are 6 ft. 10 in. high, 3 ft. 4¼ in. wide and are fitted with lock or cremone bolts. Bronze threshold furnished when specified. Carried in stock in New York.

Windows and Doors of Special Design

We specialize in steel and bronze windows and doors of unusual design, being equipped and prepared to execute quickly special orders of any design whatsoever.

BLISS STEEL PRODUCTS CORPORATION

Manufacturers of Solid Steel Windows

EAST SYRACUSE, N. Y.

Bliss Steel Windows (Patented and Patents Pending)

Bliss steel windows are made of solid sections rolled from low carbon steel.

Joints are interlocking and designed for maximum strength. Corners of outside sections are acetylene-welded to develop full strength of the section.

Specifications for Bliss Pivoted Windows—

Sash shall be made of solid rolled low carbon steel sections; joints shall be interlocking; hinges shall have ¼-in. bearing surface on a $\frac{5}{16}$-in. diameter pin.

Ventilator shall have double contact weathering all around; no materials shall be less than ⅛ in. in thickness; ventilators within reach of floor shall be operated with cam and stay bar, all other ventilators shall be operated with spring catch and chain. Corners of frame and ventilators shall be welded.

Glass shall be held in place with four glazing springs for each light.

Specifications for Bliss Protected Type Windows—

Sash shall be made of solid rolled low carbon steel sections; joints shall be interlocking. Ventilators shall have double contact weathering and shall be operated with cam latch; pole rings shall be used only where bottom of ventilator is more than 6 ft. from floor. Friction shoes and pins shall be of bronze. Corners of frame and ventilators shall be welded; no material shall be less than ⅛ in. thick. Glass shall be held in place with four glazing springs for each light.

Specifications for Bliss Basement Windows—

Basement Windows shall fit opening 32 in. wide and of proper height to fit building materials as called for on plans. Ventilator shall be top hinged to swing in and shall be removable from frame without tools; no material shall be less than ⅛-in. thick. Glass shall be held in place with four glazing springs for each light.

Where weathertightness is important, specify Bliss steel windows—they will reduce fuel bills.

DETROIT STEEL PRODUCTS COMPANY

Manufacturers of Fenestra Steel Windows

2250 East Grand Boulevard, DETROIT, MICH.

(1) Experience and Facilities

Fenestra, the Latin word for "window," is also the registered trademark of the first steel window made in America. Since 1907, the DETROIT STEEL PRODUCTS COMPANY has manufactured these windows under exclusive patents covering the Fenestra joint, a process of interlocking steel bars in such a manner that strength increases at the point of intersection. The company has always enjoyed an exceptional reputation for financial soundness and is recognized as one of Michigan's strongest industrial concerns. Its product has been used on many of the largest structures in the United States. Besides the main plant covering 14½ acres in Detroit, branch plants are maintained at Oakland, California, and Toronto, Canada. The product is sold through 14 branch offices, direct agents in principal cities, dealers in towns of every size, and a world-wide export organization. Canadian sales are handled through the Canadian Metal Window and Steel Products Company, Ltd., of Toronto.

(2) Scope of This Catalogue

While the DETROIT STEEL PRODUCTS COMPANY is fully equipped to manufacture solid steel windows, doors, partitions and operators of every type and character, it is manifestly impossible to show in any catalogue the hundreds of special designs which this company can supply. This catalogue, therefore, covers only such designs as have been accepted throughout the steel window industry and approved by the Department of the Interior as the stock and standard products normally used in building.

On individual operations where windows of special design are absolutely required, layouts and detail drawings are supplied without added cost. To secure the most practical and economical window designs, we strongly recommend consultation with our branch offices and agents *at the time the building is designed.*

(3) Designing Service

To assist in the proper designing of steel windows for architectural structures, we maintain an Architectural Service Department composed of architects with special training in the correct use of Fenestra in all types of monumental buildings. A word to your local Fenestra representative will place this department at your disposal without charge or obligation, with either direct personal service in your own drafting room or through intelligent co-operation from headquarters in Detroit.

(4) Casement Installation Service

Since the Fenestra Casement Window is for the most part installed by the carpenters and brick-masons on residential and apartment house projects, the DETROIT STEEL PRODUCTS COMPANY maintains a service organization for the purpose of advising and instructing the builder and where necessary or desirable, inspecting and servicing the installation at the time the windows are installed. This is a free service. It involves no charge and entails no obligation.

(5) Erection Service

The FENESTRA CONSTRUCTION COMPANY, a subsidiary of the DETROIT STEEL PRODUCTS COMPANY, offers builders the service of an organization especially equipped and trained for the erection and field painting of Fenestra windows.

Under separate contract, this company will assume complete responsibility for the delivery, handling, erection and painting of Fenestra products and will guarantee satisfaction from the time the material leaves the factory until it is installed in the building. Twelve erection supervisors and twenty-seven experienced field superintendents are constantly employed in this work all over the United States.

GENERAL INFORMATION—READ CAREFULLY

(6) Nomenclature

Numbers designating various types of Fenestra Windows are translated as follows: first digit—number of lights in width; second digit—number of lights in height; third digit—number of ventilators or swing leaves; fourth digit—number of lights in each ventilator or leaf; fifth digit—number of lights between ventilator or swing leaf and the sill of the window. Thus a casement type 4528 indicates a unit 4 lights wide, five lights high with two 8-light swing leaves at the sill. A Horizontally Pivoted type 35161 indicates a unit 3 lights wide, 5 lights high with one 6-light ventilator 1 light above the sill.

(7) Dimensions

In all Fenestra except casements and basements, the window dimension is always equal to the clear opening. In other words, that part of the window frame which is embedded in the wall is not considered in the window dimensions. On casement windows the window opening dimension is ¼ in. larger than the window dimensions, for clearance. On basement windows dimensions are overall. See details.

(8) Stock Types

Stock types of Fenestra Windows—those types which are made up and carried in warehouses—are indicated in this book by solid outline drawings, *shaded.* Standard types—those types which are not made up but for which bars are already cut and in stock at Detroit—are shown in solid outline, *not shaded.* Listed Special Windows are shown in *broken* outline. Stock types are always preferable from the standpoint of economy and quick shipment. Standard types are next best.

(9) Installation

All window openings should be so designed that steel windows may be installed after the walls are up. This is the most economical, as well as the most practical method of erection and obviates many difficulties frequently

Continued on next page

encountered when an attempt is made to set the windows as the building progresses. Rebates, clearances and angles as shown have been accepted as the best building practice and such details should be followed closely.

Steel windows are not structural members and under no circumstances should any portion of the building structure be allowed to rest on the windows.

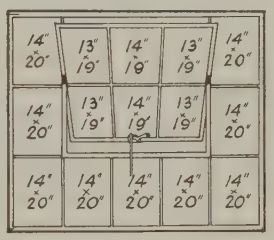
(10) Glazing

Standard glass dimensions for horizontally pivoted units are: 12x18 in. and 14x20 in.; but glass in ventilators which abut on the top, sides or bottom of the ventilator must be trimmed 1 in. along the abutting edge. See accompanying diagram. It is desirable to cut glass full to the specified dimension.

Bed Puttying

Inserting Glazing Clips

Casement and Architectural Projected glass sizes are indicated on the plates showing types and sizes of standard units.



Ordinarily, the DETROIT STEEL PRODUCTS COMPANY does not do glazing but any Fenestra representative can refer you to reputable concerns who make a specialty of glazing steel windows.

A sufficient quantity of spring glazing clips accompanies every order of Fenestra windows, without added cost.

After the windows have been bed puttied and glass inserted, the clips are used together with face putty to hold glass in place. On casement windows use two clips for each light. On horizontally pivoted windows use four clips for each fixed light, and six clips for each ventilator light.

Plate glass is desirable for casements though double strength clear glass may be used. The standard method of glazing architectural projected windows is with ¼ in. glass or double strength glass, held by glazing angles or glazing bead. On horizontally pivoted windows ¼ in. factory ribbed or wire glass or ⅛ in. ribbed, or double strength glass may be used.

(11) Putty

Wood sash putty never should be used with steel windows. Steel casement putty or any other high grade of steel window putty should be used, and is obtainable locally. Putty may be ordered from Fenestra dealers or from company warehouses in 25, 50 and 100 pound drums. Use ½ pound per square foot of glass area.

(12) Basement Windows

Fenestra Basement windows are sold exclusively through dealers. Thousands of dealers in all parts of the country carry them in stock for immediate delivery. Any responsible dealer can secure them by writing to the home office at Detroit.

(13) Lists and Schedules

We recommend that all steel windows, doors, partitions or operators be accurately listed and located either in schedules on plans or in specifications. If more than one type of the same product be desired, each type should be listed and located separately.

In the case of mechanical operators, it should be clearly indicated whether the ventilators are to be operated from one or more stations and whether in single or in multiple runs. These details assure greater accuracy in estimates.

(14) Fillets to Increase Strength

Most of the bars used in the manufacture of Fenestra steel windows, doors and partitions, are of solid, open hearth steel, hot rolled to special Fenestra designs. All such bars are rolled with heavy fillets in all re-entrant angles. These fillets increase the strength and rigidity of the bars, making them much stronger than similar sections of pressed metal

(15) Protection of Hardware

We strongly recommend that hardware be stored carefully in the original packages and that it be attached *only* after the windows, doors or partitions have been erected, glazed and painted.

(16) Galvanizing

Where specified at the time the order is taken, Fenestra Architectural and Industrial Windows can be supplied, hot galvanized. (Certain parts, such as glazing angles and side arms, electro-galvanized.) Mechanical operators may also be secured, galvanized, under the same conditions with the exception of powers which are painted with aluminum paint.

DEPARTMENT OF ENGINEERING RESEARCH

Due to the importance of adequate light and ventilation in the modern industrial building, increased attention is being given to the fenestration or window layout.

The daylighting characteristics of a building under various conditions can be predetermined by methods of proved accuracy and the amount and distribution of the natural illumination can be adjusted to a remarkable degree. Dirt accumulation, reflecting surfaces on sides and roofs of adjoining buildings, size and location of monitors as well as the shape, all have their influence and are subject to rules that can be applied in making a comparative analysis.

Likewise, the airation (natural ventilation) of a building or group of buildings can be predetermined and controlled; the orien-

Continued on next page

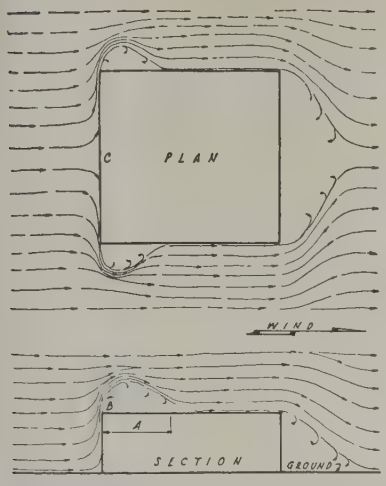


Diagram Showing How Wind-jump Is Formed and Its Location

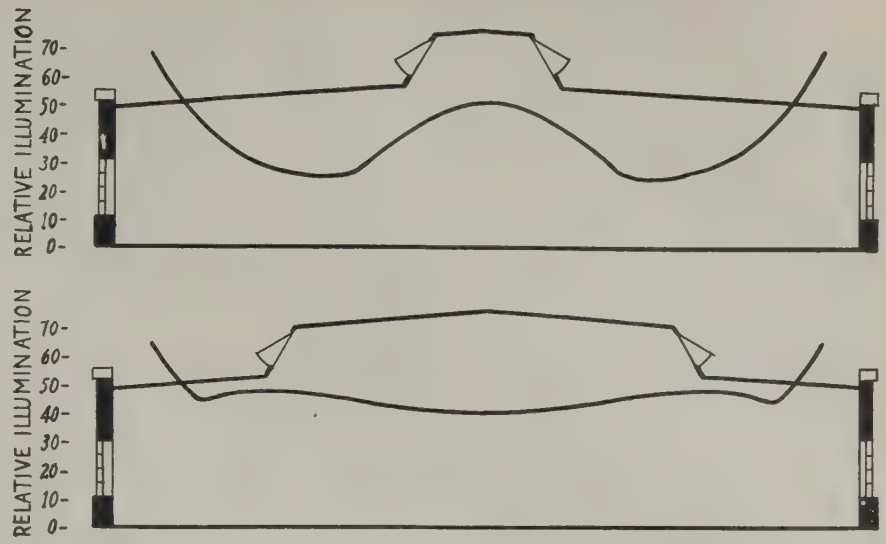

Diagram Showing Relocation of Windows by Means of a Wider Monitor and Its Effect on Distribution of Natural Light

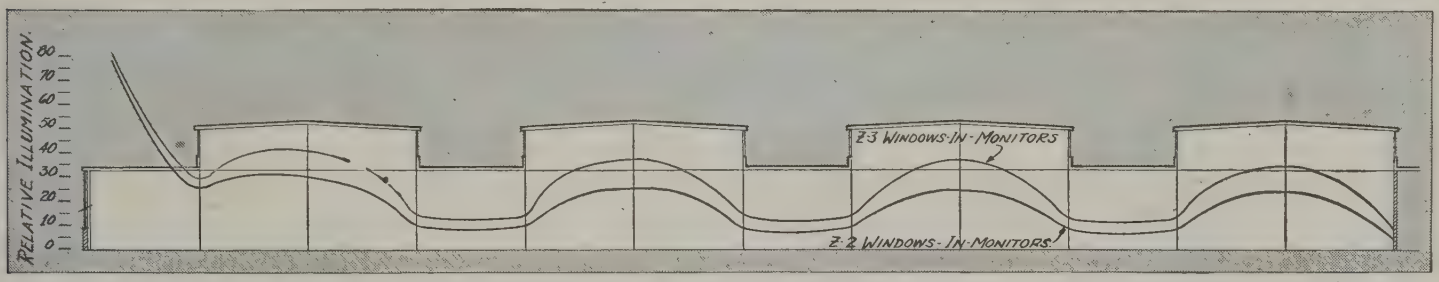
tation of the building in relation to prevailing winds, the size and location of the openings, the motive head formed by the temperature difference, and the suction or vacuum created by the wind jump are important factors to be considered if effective airation is to be obtained.

Frequently it is possible to make suggestions in the design of the fenestration to provide better distribution of the daylighting or more effective airation without changing the window areas. Sometimes the results desired can be obtained with even more economical construction than is called for on the original design.

Any architect or engineer engaged in a major operation can obtain through the nearest office of the Detroit Steel Products Company, a thorough analysis of the daylighting and airation possibilities of any proposed building design without cost or obligation.



Curves Show How Addition of One Pane to Height of Monitor Windows Affects Relative Intensity and Distribution

(A) STEEL CASEMENT WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(A-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(A-2) General

Steel Casement Windows shall be *Fenestra* as manufactured by Detroit Steel Products Company.

(A-3) Material

(A-3a) Casement Sections—All sections shall be specially designed, hot rolled, solid steel casement bars with heavy fillets in all re-entrant angles.

All frame members and the stiles and rails of each swing leaf shall be rolled with a ⅛" baffle.

Muntins shall be T bars.

(A-3b) Mullions—All mullions shall be hot rolled, solid steel T bars.

Note: Use when two or more Casements are placed side by side or one above another in the same opening.

Note: Pressed metal or built up sections should not be used for either vertical or horizontal mullions.

(A-4) Construction

(A-4a) Frames and Swing Leaves—Frames and the stiles and rails of swing leaves shall be baffled Z bars mitered at all corners and electrically butt welded. All exposed faces at welds shall be ground to a smooth finish. Provide continuous, two-point, flat contact weathering between swing leaves and frame.

(A-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase the rigidity and strength at intersections. Joints at frames, stiles and rails shall be mortise and tenon, air hammer riveted.

Note: Intersections of casement window muntins are made substantially as described on Fenestra Page 40.

Note: Muntins may be omitted to permit glazing in single lights or leaded glass. If desired so specify. We do not supply leaded glass.

(A-4c) Vertical Mullions—Vertical mullions shall be 1⅝" deep. Provide bolts for frame attachment.

(Continued on Fenestra Page 4)

(A-4d) Horizontal Mullions—Horizontal mullions shall not be less than 2¼" deep with tip of protruding web bent downward to form a drip. They shall be continuous from jamb to jamb. Provide bolts for frame attachment.

(A-4e) Copper Head-Drip—Wherever swing leaves extend to head of frame, provide a continuous 20-gauge, cold rolled, copper drip.

Note: Copper drip is shipped unattached. See details Fenestra Page 5.

(A-4f) Jamb and Head Fins—

Note: We recommend that for all masonry construction jamb and head fins be specified to provide added anchorage and form wind stop. Where used, Casements must be built into the masonry work (not installed in prepared openings). See note (A-8). (See detail Fenestra Page 5.) Their added cost is warranted. If desired so specify. If not included specify that jamb and head anchor clips shall be furnished.

(A-4g) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to attach to frame as required.

(A-5) Attached Hardware

Note: Attached at factory.

(A-5a) Side Hinges—All side hung swing leaves shall be hung on two (2) heavy, extension (cleaning) hinges of special, solid rolled, steel with heavy re-entrant angle fillets. Hinge pins (non-removable) shall be of solid bronze accurately fitted into flanged, bronze bushings.

Note: Bronze pins and bushings provide 100% bronze bearing at all moving points.

(A-5b) Top Hinges—Top hung swing leaves in transoms shall be hung on heavy steel hinges with bronze pins.

(A-5c) Locking Handle Brackets—Ornamental locking handle brackets shall be cut from special, solid rolled, steel sections and both riveted and welded to the swing leaf stiles.

(A-5d) Operator Provisions—Bottom rails of all side hung swing leaves shall be provided with tapped holes, standardized as to size and location to take any of the six types of casement operators.

Note: See (A-6c).

(A-5e) Strikes (for Side Hung Swing Leaves)—Provide bronze strike plates attached to frames.

(A-6) Detached Hardware

Note: See Fenestra Page 7.

(A-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

(A-6b) Locking Handles (for Side Hung Swing Leaves)—Ornamental locking handles, so designed as to produce a cam action, shall be:

(1) Handle 198 (malleable iron with dull black, rust-resisting finish) (dark oxidized bronze).

(2) Handle 699 (dark oxidized bronze).

Note: Select as to design and material. No. 699 at slight added cost over No. 198. Bronze at added cost over iron.

Handles shall be attached to handle brackets with bronze hexagonal headed bolts tap-screwed into steel, spring, friction clevices.

Note: Clevice assures constant and even tension which prevents handle from becoming loose.

All handles at latch shall be provided with notched heads to permit restricted ventilation.

(A-6c) Operators (for Side Hung Swing Leaves)—

Note: Select as required.

Note: All casements are furnished with the "Standard" operator. Where desired, any of the types listed "Optional" may be substituted at a reasonable added cost.

(1) *Standard:* Sliding Stay (malleable iron with dull black rust-resisting finish).

(2) *Standard:* Peg and Stay (bronze peg, malleable iron stay with dull black rust-resisting finish, stay plate and stay bracket).

Note: In oxidized bronze for both 1 and 2 Standards at slightly added cost.

(3) *Optional:* Thumb Screw Stay (dull black rust-resisting finish, oxidized bronze friction plate, guide and thumb screw).

(4) *Optional:* Gear Type Underscreen (malleable iron with black rust-resisting finish or oxidized bronze).

(5) *Optional:* Surface Type Underscreen (malleable iron with dull black rust-resisting finish).

Note: In oxidized bronze at slightly added cost.

(6) *Optional:* Flush Type Underscreen (oxidized bronze).

(A-6d) Operator (for Top Hung Transom Sash)—

(1) *Standard:* Peg and Stay (malleable iron with dull black rust-resisting finish).

SYMMETRICAL COMBINED WIDTHS

Standard widths	Units wide	Panes wide	Panes wide per unit	Vert. mull.
1 ft. 7⅜ in.....	1	2	2	0
3 ft. 1½ in.....	1	4	4	0
3 ft. 2⅞ in.....	2	4	2, 2	1
4 ft. 7½ in.....	1	6	6	0
4 ft. 10⅜ in.....	3	6	2, 2, 2	2
6 ft. 3⅛ in.....	2	8	4, 4	1
6 ft. 4½ in.....	3	8	2, 4, 2	2
6 ft. 5⅞ in.....	4	8	2, 2, 2, 2	3
7 ft. 10½ in.....	3	10	2, 6, 2	2
7 ft. 10⅝ in.....	3	10	4, 2, 4	2
8 ft. 1⅜ in.....	5	10	2, 2, 2, 2, 2	4

Use these widths with any heights.

(A-7) Mastic

The Casement Manufacturer shall furnish a sufficient quantity (one pound to ten lineal feet) of mastic to form a weather-tight frame bed, at head, jambs and sill (and mullions).

(A-8) Erection

Note: In brick masonry construction wherever casements are built into the brickwork (not in prepared openings) without wood bucks, include in the masonry specification a clause that the mason shall use every precaution against springing or racking the casements out of shape.

Note: Where desired, the Fenestra Construction Co., *under a separate contract will erect Casements windows in prepared openings. (See Paragraph 5, Fenestra Page 1.) If required so specify.*

(A-8a) All casement windows shall be set plumb and true, properly aligned and securely anchored before glazing.

(A-8b) All mullions shall be rigidly bolted to frames.

(A-8c) Set all frames in mastic neatly applied in a narrow beading where they come in contact with the building construction (or steel mullions). Use one pound of mastic to 10 lineal feet.

(A-8d) Apply all hardware in accordance with the manufacturer's directions.

Note: Give second coat of paint and glaze before applying finish hardware.

(A-9) Painting

All casement windows shall be given one dip-coat of grey lead and oil paint by the manufacturer before shipment.

Note: The following should be provided for in the painting specifications:

Note: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

(A-10) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(A-10a) Glass—Glass shall be (¼" thick plate) (double strength).

Note: Single strength glass is not recommended.

(A-10b) Putty—Putty shall be Fenestra Steel Casement Putty.

Note: This is a special, high-grade, steel window putty which assures quick setting. Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(A-10c) Glazing—All casement windows shall be glazed from the outside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring glazing clips furnished by the Casement Manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. See Paragraph (A-9).

(A-11) Provisions for Screens

Note: Fenestra Page 12 gives suggestions for screening provisions. Include in the Carpentry Specifications, the necessary clauses covering stops and wood trim. Space between screen and casement frame must not be less than 2⅛".

(A-12) Screens

Note: Metal or wood screens, sliding, hinged or rolling may be used as desired. Screens are not included by the Casement Manufacturer and should, therefore, be provided for under another division of the specification.

(A-13) Shade and Drapery Brackets

Note: Shade and drapery brackets are not attached to the steel casement frame and are, therefore, not provided by the Casement Manufacturer. Suggestive provisions are made in Fenestra Page 12.

SINGLE LIGHT UNITS—STOCK TYPES

To accommodate large lights of plate glass or panels of leaded glass, the six Single Light Units shown at the left on this page have been placed in stock and are now ready for immediate delivery, as are the other stock types shown on Plate A-102.

These casements correspond in every respect to the same sized units (fixed and ventilated) on Plate A-102 except that no provision is made for interior muntin bars. The units shown on this page have, therefore, a clean perimeter free from the punching necessary when muntin bars are optional.

Glass sizes are shown opposite the letters in the table below.

When ordering any stock, casement units designed for single lights of plate glass or leaded glass panels, specify "M.O." (Muntins Omitted). Ventilated units are Right or Left handed as desired.

GLASS SIZES

Units	Sizes, in.	Units	Sizes, in.
A-1	17⅜x25⅜	D-1	16¼x24¼
B-1	17⅜x37⅝	E-1	16¼x36½
C-1	17⅜x49⅞	F-1	16¼x48¾

SUGGESTIONS FOR LEADED GLASS PANELS

The following page (Plate A-103) shows suggested designs and dimensions for standard Leaded Glass Panels of a size and character to fit stock types of Fenestra Casements including the Single Light Units shown above. (No panels are shown suitable for semi-circular heads.)

We do not make leaded glass. The accompanying suggestions are offered for the benefit of architects and builders, so that leaded panels may be purchased locally with assurance of correct dimensions and with a minimum of detail labor and expense.

In designing both the Rectangular Leaded and the Diamond Leaded panels, we have kept constantly in mind the proportions used in the fine examples of Tudor architecture. The glass dimensions, 5½ by 8 in., which were so frequently utilized by the masters of that period, have been retained as nearly as possible and standardized as far as compatible with stock types and sizes.

Eighteen different panels are shown in Rectangular leaded and in Diamond Leaded types. Six of these panels are dimensioned to fit ventilated units or the ventilated portion of combination units and are so indicated by the prefixed letter "V." Six panels are dimensioned to fit fixed units or the fixed portions of combination units and are so indicated by the prefixed letter "F." Six panels are dimensioned to fit fixed transoms in single or combined units and are so indicated by the letter "T." The numbers "22," "24," "62" and so on *do not refer* to the number of panes in the width and height of the Leaded Glass panels, but *do refer* to the number of standard panes in the width and height of the stock casements into which the panels are designed to fit. The letters "RL" and "DL" indicate "Rectangular Leaded" and "Diamond Leaded" panels, respectively.

Thus the stock casement Type 22 (Plate A-102) with muntins omitted, can be fitted with either RL-22-F or DL-22F. The dimensions of the casement will be 1 ft. 7⅜ in. by 2 ft. 3¼ in. while the dimensions of either leaded panel will be 17⅜ in x 25⅜ in.

A table of our stock types of casements and the leaded glass panels required for each is given at the right.

All leaded glass designs have been carefully arranged so that when several panels are used in combination units, the various panels form a harmonious whole with cames in proper relation to one another.

All lights should be double strength clear glass. Framing cames should be ⅞ in. offset flat lead on Fixed and Transom Panels and ⅝ in. flat lead on Ventilating Panels. All interior cames should be ½ in. flat lead.

(D) STEEL BASEMENT WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: *These windows are sold exclusively through dealers. See Paragraph 12 Fenestra Page 2.*

(D-1) Work Included

Note: *List and locate. (See Paragraph 13 Fenestra Page 2.)*

(D-2) General

Basement Windows shall be *Fenestra* as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(D-3) Materials

All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles. All frame and sash members shall be rolled with ⅛" baffles. Sash bottom rails shall be rolled with special projecting drip. Provide steel fins for jamb anchorage and weathering. Muntins shall be T bars. Provide two holes in each frame jamb for screen attachment.

Note: *Sections (except sash bottom rails) are similar to Casement Window Sections (see Fenestra Pages 5, 10 and 11) arranged for inside glazing.*

(D-4) Construction

Sills and jambs of frame shall be continuous of one piece mitered and turned at corners. Joints at head of frame and all joints of sash shall be mortise and tenon, air hammer riveted. Fins shall be spot welded to frame jambs. Provide continuous, two-point, flat contact weathering between sash and frame.

(D-5) Hardware

All hardware shall be of steel and shall be attached at the factory. Hinges shall be of "pinless" hook design riveted to the frame, so constructed, in conjunction with formed slots in the sash top rail, that the sash may be removed for glazing. Locks shall be self-centering and shall consist of a bevel lipped, slotted angle, riveted to sill and a wedge pin attached by ring and heavy chain to the bottom rail of sash to act as the support for the sash when open.

(D-6) Erection

Basement windows shall be set plumb and true securely anchored to the building construction. Adjust all sash to properly operate.

(D-7) Painting

All Basement Windows shall be given one dip-coat of grey, lead and oil paint by the Manufacturer before shipment.

Note: *The following should be provided for in the painting specifications:*

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

(D-8) Glass and Glazing

Note: *The following should be included in the Glazing Specifications:*

Note: *See Paragraph 10 Fenestra Page 2.*

(D-8a) **Glass**—Glass shall be double strength.

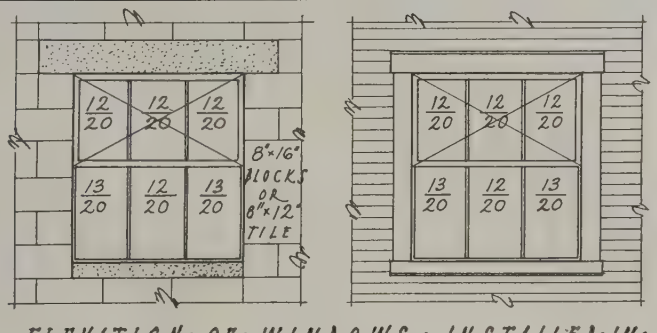
Note: *Single strength glass is not recommended.*

(D-8b) **Putty**—Putty shall be a high grade Steel Window Putty.

Note: *Ordinary wood sash putty must not be used. See Paragraph 11 Fenestra Page 2.*

(D-8c) **Glazing**—All windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring glazing clips furnished by the Window Manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: *Do not paint until putty has thoroughly hardened. See Paragraph (D-7).*



ELEVATION OF WINDOWS INSTALLED IN CONCRETE BLOCK AND FRAME CONSTRUCTION

NOTE

THE FENESTRA UTILITY WINDOW IS DESIGNED FOR SMALL BUILDINGS SUCH AS GARAGES FILLING-STATIONS, SHOPS, STORES AND BASEMENTS HIGH ABOVE THE GRADE LINE.

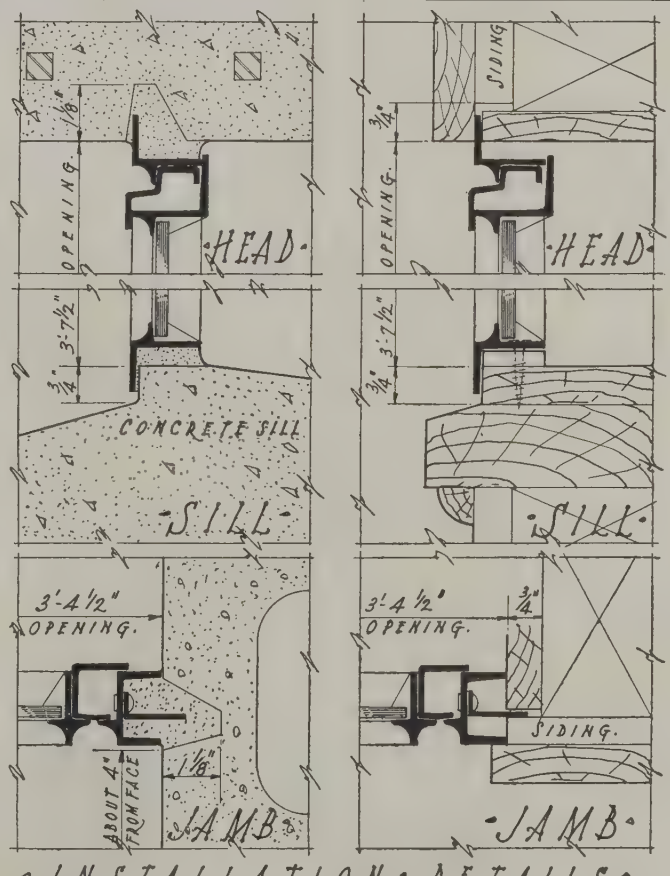
IT IS ALSO DESIRABLE IN AREA-WAYS WHERE MORE LIGHT IS NEEDED THAN IS SUPPLIED THRU FENESTRA BASEMENT WINDOWS, AS IN LAUNDRY ROOMS.

IT IS MADE IN ONE SIZE, ONLY, 3'-4½" × 3'-7½".

VENTILATOR IS ONE LIGHT HIGH, PIVOTED 2" ABOVE CENTER TO PREVENT UNDUE PROJECTION EITHER INSIDE OR OUTSIDE.

SECTIONS AND FITTINGS ARE THE SAME AS FOR HORIZONTALLY PIVOTED WINDOWS.

OPERATING HARDWARE CONSISTS OF IRON CAM HANDLE AND NOTCHED STAY-BAR AS IN HORIZONTALLY PIVOTED WINDOWS.



INSTALLATION DETAILS

SCALE: 3" = 1'-0"

(GA) FENESTRA OFFICE WINDOWS—Specifications

Notes are explanatory only and need not be included in specifications

(GA-1) Work Included

Note: List and locate.

(GA-2) General

All windows shall be Fenestra Office Windows as manufactured by DETROIT STEEL PRODUCTS COMPANY.

(GA-3) General

(GA-3a) Window Sections—All sections shall be special designed, hot rolled, solid steel bars with heavy fillets in re-entrant angles, designed for exterior glazing.

(GA-3b) Frame Members—Jamb and head members shall be 1½" unequal leg, sections (outside leg 1⅜", inside leg ¾") designed for ⅝" anchorage. Sills and horizontal intermediate bars shall be Z's with offset baffles.

(GA-3c) Ventilator Members—Ventilator stiles and rails shall be 1¼x1⅜" Z or T bars, with baffles.

(GA-3b) Jamb Weathering—Weathering at jambs shall be 1⅜" offset unequal leg channels forming beveled interior sliding shoe grooves.

(GA-3e) Muntins—Muntins shall be 1¼x⅞" T's.

(GA-3f) Vertical Mullions—Vertical Mullions shall be interior and exterior plates secured with bolts and nuts.

Note: Other designs of mullions may be used. If desired, provision for them should be made in the ornamental iron or structural steel specifications.

(GA-3g) Horizontal Mullions—Horizontal Mullions shall be standard Fenestra (Type 1—Z and angle) (Type 2—angle and channel with interior pressed steel mullion cover).

Note: Other designs of mullions may be used. If desired, provisions for them should be made in the ornamental iron or structural steel specifications.

(GA-4) Construction

(GA-4a) Frames—Frames, including intermediate bars, shall be mortise and tenon, and electrically welded at corners. All exposed faces at welds shall be ground to a smooth finish.

(GA-4b) Ventilators—All stiles and rails of ventilators shall be mitered at corners and electrically butt welded with all exposed faces at welds ground smooth.

(GA-4c) Muntins—Joints at frame and ventilator members shall be closely fitted mortise and tenon, air hammer riveted.

(GA-4d) Vertical Mullions—Where two or more windows are placed side by side in the same opening, provide vertical mullions.

(GA-4e) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to attach to frames where required.

(GA-5) Attached Hardware

Note: Attached at factory.

(GA-5a) Ventilator Operating Hardware—Ventilators shall (swing-out from the bottom while sliding down from the top) (or) (swing-in from the top while sliding up from the bottom) as indicated. The ventilators shall be so constructed that by tilting they may be conveniently washed from inside the building.

Note: Specify swing-out, swing-in or both as required.

Each ventilator shall be balanced on two supporting arms of solid spring steel. Connections between supporting arms and window frame and between supporting arms and ventilators shall be made by malleable iron brackets rigidly supported and double riveted to the vertical members, with arms attached to brackets by bronze shoulder pivots. Each ventilator shall be equipped with two brass friction shoes sliding vertically in the weathering channels.

(GA-5b) Alignment Springs—Each open-out ventilator shall be equipped with two shouldered, alignment-control bronze springs riveted to the channel jambs.

Note: The shoulders of these springs are so designed and located as to limit the downward travel of the friction shoes and stop all open ventilators in uniform alignment of approximately 60 degrees. When it is desired to open the ventilator at a greater angle for washing, light pressure on the springs depresses the shoulders and allows the friction shoes to slide past. As the ventilator is returned to a closed position, the action of the spring is automatic.

Note: Include if ventilators are more than 20 in. high.

(GA-5c) Cam Handle Brackets—On open-out ventilators provide special design solid brackets, rolled Z-bar, rigidly riveted to ventilator bottom rails for attachment of cam handles.

(GA-6) Detached Hardware

(GA-6a) Operating Hardware for Fenestra Office Windows shall be of bronze, light coinage finish, and packed separately.

(GA-6b) Locking and Operating Hardware—

Note: Select as required.

(1) ***For Open-out Ventilators***—Bronze pole ring, Part 151 at head of ventilator. Bronze, cam-action handle, Part 733, attached to bracket on bottom rail by bronze bolt and friction clevis (all handle shall be provided with notched heads to permit restricted ventilation), iron strike plate, Part 737, with brass rubbing rivet.

(2) ***For Open-in Ventilators***—Bronze spring latch with ornamental handle, Part 734; riveter, iron, lipped strike, Part 735.
(3) Where open-in ventilator is located immediately below an open-out ventilator, use combination riveted iron strike, Part 736.

(GA-7) Mastic

Note: Include in the Masonry Specifications that all windows shall be calked at head, jambs and sill with mastic or other calking compound, neatly applied after erection, wherever the frames meet the building construction.

(GA-8) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed.

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.
Note: Where window frames come in contact with Fenestra Mullions or Transom Bars, calking is to be supplied and applied by the erectors.

(GA-8a) All Fenestra Office Windows shall be erected in prepared openings by the *Fenestra Construction Company*, under a separate contract.

(GA-8b) All windows shall be set plumb and true, properly aligned and securely anchored and all ventilators properly adjusted before glazing.
Standard Fenestra sill anchors shall be used under the following conditions:
(1) In all cases where a ventilator comes at the sill of the window.
(2) In all multiple unit openings where mullions are not anchored into the sills.
Standard Fenestra Jamb Anchor Clips, No. 822, to be used as necessary.

(GA-8c) Apply all hardware in accordance with the manufacturer's directions. Detached hardware shall not be installed until after glazing and painting have been completed.

(GA-9) Painting

All windows shall be given one dip-coat of gray, lead and oil paint by the manufacturer before shipment.

Note: The following should be provided for in the painting specifications: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the Fenestra Construction Company at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.

Continued on next page

(GA-10) Glass and Glazing

Note: The following should be included in the Glazing Specifications.

(GA-10a) Glass—Glass shall be (¼" thick plate) (¼" wire of type desired) (double strength).

Note: ¼-in. thick glass is recommended.

(GA-10b) Putty—Putty shall be a high grade steel window putty.

Note: Ordinary wood sash putty must not be used.

(GA-10c) Glazing—All Fenestra Office Windows shall be glazed from the outside. All glass shall be set in a bed of putty and secured by copper plated steel, spring glazing clips, furnished by the window manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Use four to twelve glazing clips per pane depending on the size of the pane and whether it is in a fixed or movable portion of the window.
Note: Do not paint until putty has thoroughly hardened. See Paragraph (GA-9).

(GA-11) Shading

Note: All shades must be located at least 2 in. from the inside face of the window for hardware clearance.

Note: Shade bracket clips designed to attach by drilling and tapping the top of each jamb section, are supplied at slight added cost. These clips are of sufficient depth to bring the shade bracket in the proper position and are slotted to accommodate any standard shade bracket. If shade bracket clips are required, so specify.

Note: All Office Window Dimensions are equal to the Clear Opening. Frame members project beyond these points on all four sides for anchorage in masonry.

Nomenclature: Standard Types of Fenestra Office Windows are designated by the letter "P" which indicates a "Projecting" type of ventilator. Types without ventilators are numbered consecutively from 1 to 27 and carry the suffix "F" meaning "Fixed." Types which include one or more ventilators with a fixed pane at the sill are numbered from 1 to 45. Types which include one or more ventilators with open-in vent at sill are numbered from 46 to 90. Types which include two or more ventilators with open-in vent at sill surmounted by a fixed pane are numbered from 91 to 115.

(GB) ARCHITECTURAL PROJECTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(GB-1) Work Included

Note: List and locate. (See Paragraph 13 Fenestra Page 2).

(GB-2) General

Architectural Projected Windows shall be *Fenestra* as manufactured by Detroit Steel Products Company.

(GB-3) Materials

(GB-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in re-entrant angles.

(GB-3b) Frame Members—All frame members shall be unequal leg channel sections, outside leg 1⅝", inside leg ⅞".

(GB-3c) Muntins—Muntins shall be 1⅜" deep.

(GB-3d) Vertical Mullions—Vertical Mullions shall be standard Fenestra, hot rolled, solid steel T bars.

Note: Use where two or more windows are placed side by side in the same opening.

(GB-3e) Horizontal Mullions—Horizontal mullions shall be standard Fenestra (hot rolled, solid steel Z bars and angles) (structural angles and channels).

Note: Specify type. Use where two or more windows are placed one above another in the same opening.

(GB-3f) Mullion Covers—(Vertical) (Horizontal) Mullion covers shall be of pressed steel designed to neatly cover mullion recesses.

(GB-4) Construction

(GB-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted and electrically welded at all corners. All exposed faces at welds shall be ground to a smooth finish. Provide continuous two point, flat-contact weathering between ventilators and frames.

(GB-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase the rigidity and strength at the intersections. Joints at frames shall be mortise and tenon, air hammer riveted.

Note: Intersections of muntins are made as illustrated on Fenestra Page 40. An exclusive Fenestra feature.

(GB-4c) Glazing Angles—All glass shall be secured with glazing angles neatly mitered at corners. Angles shall be secured to head, jamb and sill frame and ventilator members with brass tap screws and to muntins with brass barrel screws.

(GB-4d) Vertical Mullions—Where two or more windows are placed side by side in the same opening, provide vertical mullions with bolts for frame attachment.

(GB-4e) Horizontal Mullions—Where two or more windows are placed one above another in the same opening, provide horizontal mullions with bolts for frame attachment.

(GB-4f) Mullion Covers—Provide (vertical) (horizontal) steel mullion covers with the necessary clips and bolts for attachment.

(GB-4g) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to attach to frame as required.

(GB-5) Attached Hardware

Note: Attached at Factory.

(GB-5a) Ventilator Operating Hardware—Ventilators shall (swing-out from the bottom while sliding down from the top) (or) (swing-in from the top while sliding up from the bottom) as indicated. The *open-out* ventilators shall be so constructed that by tilting them slightly beyond the horizontal they may be conveniently washed from inside the building. (The *open-in* ventilators shall tilt to 90°.)

Note: Specify swing-out, swing-in or both as required.

Each ventilator shall be accurately balanced on two supporting arms of solid spring steel attached to the ventilator with bronze shoulder pivots, equipped with bronze washers. Connections between supporting arms and window frame shall be made by malleable iron brackets rigidly supported on the horizontal frame members or muntins and double riveted to the vertical frame members or muntins with arms attached by bronze shoulder pivots.

Each ventilator shall be equipped with two bronze friction shoes sliding vertically in the ventilator jambs to guide the ventilator and prevent rattling. Friction shoes shall be channel shaped (to insure ease of operation) and mounted on bronze shouldered studs, so constructed that through galvanized compression springs (covered by weather protecting bronze tubes) uniform tension is secured. Shoes shall be accurately gauged and located and solidly riveted in place to assure proper, constant pressure at the jambs.

(GB-5b) Alignment Springs—Each *open-out* ventilator shall be equipped with two shouldered, alignment-control bronze springs riveted to the channel jambs.

Note: The shoulders of these springs are so designed and located as to limit the downward travel of the friction shoes and stop all open ventilators in uniform alignment of approximately 60 degrees. When it is desired to open the ventilator at a greater angle or reverse for washing, light pressure on the springs depresses the shoulders and allows the friction shoes to slide past. As the ventilator is returned to a closed position, the action of the spring is automatic. See Fenestra Page 24.

Note: Include if open-out ventilators are used.

(GB-5c) Alignment Stops—Each *open-in* ventilator shall be equipped with a solid steel stop which prevents its opening farther than 90°.

Note: Include if open-in ventilators are used.

(GB-5d) Cam Handle Brackets—Where required, provide special design malleable iron brackets, triple riveted to ventilators, for attachment of cam handles.

(GB-6) Detached Hardware

Note: See Fenestra Page 24.

(GB-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

(GB-6b) All hardware for Architectural Projected Windows shall be of bronze, oxidized bronze finish.

(GB-6c) Locking and Operating Devices

Note: Select as required.

Note: Where ventilators are screened, special flat-type bronze handles may be secured which will permit the screen to be set 1" from the face of the window instead of 2" necessary with standard cam handles. Specify if desired.

(1) *For open-out ventilators within reach from floor*—Bronze cam handle, Part 114, attached to malleable iron bracket by bronze screw-head bolt through steel spring friction clevis. Bronze strike plate carrying a 6" bronze hook stay, Part 122, riveted to window at ventilator sill.

(2) *For open-out ventilators beyond reach from floor*—Riveted bronze pole ring, Part 151, at head of ventilator. Bronze cam handle, Part 150, with hole for pole hook, attached to malleable iron brackets by bronze, screw-head, steel, spring, friction clevis. Riveted bronze strike plate.

(3) *For open-in ventilators within reach from floor*—Riveted bronze spring latch with ornamental handle, Part 212, at head of ventilator. Riveted bronze lipped strike.

(4) *For open-in ventilators beyond reach from floor*—(Riveted bronze spring latch with pole hook ring handle, Part 147, at head of ventilator; riveted steel strike). (Riveted bronze spring latch with endless chain, Part 146, at head of ventilator. Riveted steel strike. Riveted bronze chain guide, Part 149, at sill).

Note: Select type desired.

(GB-7) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed. (See Paragraph 9, Fenestra Page 1.)

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(GB-7a) All Architectural Projected Windows shall be erected in prepared openings by the Fenestra Construction Company, under a separate contract.

Note: See paragraph 5 Fenestra Page 1.

(GB-7b) All windows shall be set plumb and true, properly aligned and securely anchored before glazing.

Standard Fenestra sill anchors shall be used under the following conditions:

(1) In all cases where a ventilator comes at the sill of the window, regardless of the window width.

(2) In all cases where the window is over 5′ 0″ wide, regardless of the location of the ventilators.

(3) In all multiple unit openings where mullions are not anchored into the sills.

All ventilators shall be properly adjusted before glazing.

(Continued on Fenestra Page 24)

Continued on next page

(GB-7c) Apply all hardware in accordance with the manufacturer's directions. Detached hardware shall not be installed until after glazing and painting has been completed.

(GB-8) Painting

All Windows shall be given one dip-coat of red mineral paint by the Manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:
One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.
Note: Where desired, the Fenestra Construction Company *(see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required so specify here, including specification for paint and its application.*

(GB-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:
Note: See Paragraph 10 Fenestra Page 2.

(GB-9a) Glass—Glass shall be (¼" thick plate) (¼" wire of type desired) (double strength).

Note: ¼" thick glass is recommended. Single strength glass is not recommended.

(GB-9b) Putty—Putty shall be a high grade steel window putty.

Note: Ordinary wood sash putty must not be used. See paragraph 11, Fenestra Page 2.

(GB-9c) Glazing—All Architectural Projected Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured with glazing angles set against face putty neatly and smoothly applied.

Note: Do not paint until putty has thoroughly hardened. See note paragraph (GB-8).

(GB-10) Provision for Screens

Note: Fenestra Page 28 gives suggestions for screening provisions. Include in the Carpentry Specifications the necessary clauses covering wood trim required in conjunction with screens. Space between inside screen and window must be not less than 2" to clear standard hardware. If special "Flat Type" handles are specified. (See note, paragraph [GB-6c] 1" clearance only is required.) On account of the roller, rolling screens require a 2½" clearance.

(GB-11) Screens

Note: On open-out ventilators, metal side hinged or vertical sliding screens may be used as desired. Rolling screens up to 6' 0" wide may be used where entire window is covered. On open-in ventilators, metal, removable, fixed, outside screens may be used. Screens are not included by the Window Manufacturer and should, therefore, be provided for under another division of the specification.

(GB-12) Shading

Note: All shades must be located at least 2" from the inside face of the window for hardware clearance. Clearance for screens depends upon the type selected.
Note: Shade bracket clips designed to attach by drilling and tapping two small holes at the top of each jamb section are supplied at slight added cost (see Fenestra Page 28). These clips are of sufficient depth to bring the shade bracket in the proper position and are slotted to accommodate any standard shade bracket. Shade clips cannot be used satisfactorily with rolling screens but shade brackets may be attached to the underside of screen box. Brackets of various projections may be used to clear any type of screening except where whole opening is screened. If shade bracket clips are required, so specify.

(GC) COMMERCIAL PROJECTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: Commercial Projected Windows are in general design and operation similar to Architectural Projected Windows. They are made to meet the demand for a less expensive window of this type. The chief differences between the two are (1) the section of the frame member; (2) the addition of muntins dividing the window into small panes; (3) inside putty instead of glazing angles; (4) use of malleable iron instead of bronze hardware.

Note: Commercial Projected Windows with "open-in" ventilators are particularly adapted to Food Products Plants since these windows may be screened economically. See Paragraphs (GC-10) and (GC-11).

Note: To avoid repetition where the specification is the same as that for the Architectural Projected Windows, this is so noted. Where not identical, use the clauses here given. For Specification for Architectural Projected Window referred to, see Fenestra Page 23.

(GC-1) Work Included

Same as (GB-1).

(GC-2) General

Commercial Projected Windows shall be *Fenestra* as manufactured by Detroit Steel Products Company.

(GC-3) Materials

(GC-3a) Window Sections—Same as (GB-3a).

(GC-3b) Frame Members—All frame members shall be (special angle sections with protruding leg 1" deep) (special unequal leg channel sections).

Note: Select as required unequal leg channel at added cost over angle section.

(GC-3c) Muntins—Same as (GB-3c).

(GC-3d) Vertical Mullions—Same as (GB-3d).

(GC-3e) Horizontal Mullions—Horizontal mullions shall be standard Fenestra (hot rolled solid steel T bars) (Structural angles and channels).

Note: Specify type. Use where two or more windows are placed one above another in the same opening.

(GC-3f) Mullion Covers—Same as (GB-3f).

(GC-4) Construction

(GC-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted at all corners. Ventilators shall, in addition to riveting, be electrically welded at corners, with exposed faces ground to a smooth finish.

(GC-4b) Muntins—Same as (GB-4b).

(GC-4c) Vertical Mullions—Same as (GB-4d).

(GC-4d) Horizontal Mullions—Same as (GB-4e).

(GC-4e) Mullion Covers—Same as (GB-4f).

(GC-4f) Sill and Jamb Anchor Clips—Same as (GB-4g).

(GC-5) Attached Hardware

Note: Attached at factory.

(GC-5a) Ventilator Operating Hardware—Same as (GB-5b) (GB-5c).

(GC-5d) Cam Handle Brackets—Where required, provide solid rolled steel Z bar brackets, triple riveted to the ventilators, for the attachment of cam handles.

(GC-6) Detached Hardware

(GC-6a) Same as (GB-6a).

(GC-6b) All hardware for Commercial Projected Windows shall be (malleable iron with one coat of red mineral paint) (bronze, oxidized bronze finish).

Note: Select as required. Bronze at added cost over iron.

(GC-6d) Locking and Operating Devices—

Note: Select as required.

Note: Where ventilators are screened, special flat type handles may be secured at added cost which will permit the screen to be set 1" from the face of the window instead of 2" necessary with standard cam handles. Specify if desired.

(1) *For open-out ventilators within reach from floor*—Malleable iron cam handle attached to Z bar bracket by bolt and nut, Part 150.

(2) *For open-out ventilators beyond reach from floor*—Riveted malleable iron pole hook ring at head of ventilator, Part 151, malleable iron cam handle, Part 150, with hole for pole hook, attached to Z bar bracket by bolt and nut.

(3) *For open-in ventilators within reach from floor*—Riveted malleable iron spring latch with finger ring handle at head of ventilator, Part 147.

(4) *For open-in ventilators beyond reach from floor*—(Riveted malleable iron spring latch with endless chain, Part 146, at head of ventilator. Riveted iron chain guide, Part 149, at sill) (or) (Riveted malleable iron spring latch with pole hook ring handle, Part 147, at head).

(GC-7) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows may be erected after masonry is completed. See Paragraph 9, Fenestra Page 1.

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(GC-7a) All Commercial Projected Windows shall be erected in prepared openings by the Fenestra Construction Company, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(GC-7b) Same as (GB-7b).

(GC-7c) Same as (GB-7c).

(GC-8) Painting

Same as (GB-8).

(GC-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(GC-9a) Glass—Same as (GB-9a).

(GC-9b) Putty—Same as (GB-9b).

(GC-9c) Glazing—All Commercial Projected Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel, spring, glazing clips furnished by the window manufacturer. Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Glazing angles are obtainable at slight added cost.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (GB-8).

(GC-10) Provision for Screens

(GC-10a) For Open-out Ventilators—Same as (GB-10).

(GC-10b) For Open-in Ventilators—For open-in ventilators provide permanent brackets for removable screen support.

Note: See Fenestra Page 31.

(GC-11) Screens

Same as (GB-11).

Note: Where desired for open-in ventilators, the Window Manufacturer will furnish, at reasonable added cost, removable, tubular, steel frame, rewirable screens (baked enameled finish) with No. 16 mesh bronze screen cloth. These screens are well constructed and furnished completely adapted to and fitting the ventilator opening. (See Fenestra Page 33.) If required so specify.

(GC-12) Shading

Note: Where ventilators are "open out" shade bracket clips, slotted to accommodate standard shade brackets, may be attached by drilling and tapping two small holes at the top of each jamb section of the frame. Clips are supplied at slight added cost. If required so specify.

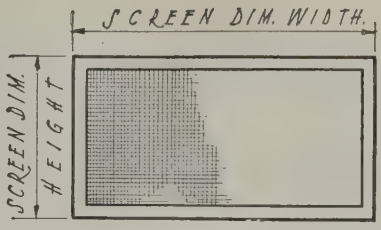
DETAIL WHEN VENT COMES TO HEAD



SIZE OF VENT	SIZE OF SCREEN	
	WIDTH	HEIGHT
4 PANE 12×18	23 7/8"	36 1/8"
6 PANE 12×18	36 1/4"	36 1/8"
8 PANE 12×18	48 5/8"	36 1/8"
4 PANE 14×20	27 7/8"	40 1/8"
6 PANE 14×20	42 1/4"	40 1/8"
8 PANE 14×20	56 5/8"	40 1/8"

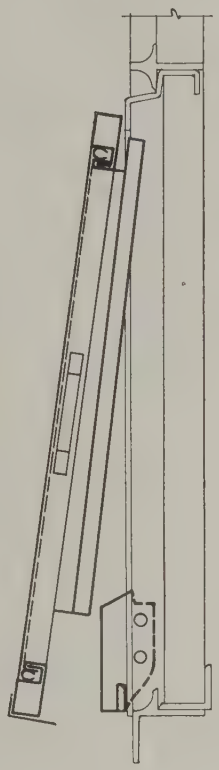
SIZES SHOWN ABOVE ARE STANDARD. ANY SIZE NOT SHOWN IS SPECIAL. SCREEN WIDTH AND HEIGHT CAN BE DETERMINED BY SUBTRACTING DIMENSIONS SHOWN ON SECTIONS, FROM THE VENTILATOR OPENING.

SCREEN FRAMES ARE MADE OF OPEN HEARTH STEEL GALVANIZED AND FINISHED IN BLACK BAKED ENAMEL.

CLOTH IS OF 16 MESH OXIDIZED BRONZE WIRE AND IS WOVEN FROM #32 GAUGE BRONZE WIRE

WHEN SCREENING IS SPECIFIED THE WINDOWS ARE PUNCHED IN SHOP TO RECEIVE NECESSARY CLIPS FOR HOLDING SCREENS WHILE SCREENS AND CLIPS ARE SHIPPED DIRECT FROM MANUFACTURER.

IF SCREENING IS NOT SPECIFIED AND LATER IS DESIRED, IT WILL BE NECESSARY TO DRILL HOLES FOR CLIPS IN FIELD.



METHOD OF ATTACHING SCREEN TO WINDOW

FIRST-OPEN VENTILATOR SLIDE END OF BAFFLE UNDER WEATHERING.
SECOND-PUSH SCREEN UP AS FAR AS IT WILL GO.
THIRD -BRING BOTTOM OF SCREEN FRAME IN TIGHT AGAINST OUTSIDE OF WINDOW
FOURTH-PUSH SCREEN DOWN FORCING BAFFLE BACK OF LUG ON BRACKET.

(L) HORIZONTALLY PIVOTED WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

(L-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(L-2) General

Horizontally Pivoted Windows shall be *Fenestra* as manufactured by Detroit Steel Products Company.

(L-3) Materials

(L-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

(L-3b) Frame Members—All frame members shall be special angle sections.

(L-3c) Muntins—Muntins shall be 1⅜" deep.

(L-3d) Vertical Mullions—Vertical mullions shall be standard Fenestra hot rolled, solid steel T bars.

Note: Use where two or more windows are placed side by side in the same opening.

(L-3e) Horizontal Mullions—

Note: Horizontal structural mullions are not furnished by the window manufacturer. Include structural steel horizontal mullions in Structural Steel Specifications.

(L-4) Construction

(L-4a) Frames and Ventilators—Frames and ventilators shall be mortise and tenon, air hammer riveted, at all corners. Provide continuous two point, flat-contact weathering between ventilators and frames.

(L-4b) Muntins—Muntin bars shall be continuous from head to sill and from jamb to jamb, so interlocked as to increase their strength at the point of intersection. Joints at frames shall be mortise and tenon, air hammer riveted.

Note: Intersections of muntins are made as illustrated on Fenestra Page 40. An exclusive Fenestra feature.

(L-4c) Vertical Mullions—Where two or more windows are placed side by side in the same opening, provide vertical mullions with bolts for frame attachment.

(L-4d) Structural Steel Clips—Furnish in types adapted to conditions, all necessary clips and bolts for attaching windows to structural steel.

Note: All structural steel is furnished by others. Include in steel specifications all punching to accommodate clips. Where masonry work will interfere with installation of clips at time windows are erected, provide that clip bolts be included and attached by the steel contractor.

(L-4e) Sill and Jamb Anchor Clips—Furnish steel (sill) (jamb) anchor clips with bolts to be attached in the field.

(L-5) Attached Hardware

Note: Attached at factory.

(L-5a) Ventilator Pivots—All ventilators shall be horizontally pivoted and supported by external, adjustable, special, solid rolled, steel butts double machine riveted through window bars and weathering.

Note: Butts are set 2" above center unless otherwise specified. Butts may be set 4" below ventilator top where windows are required to be relatively rain protecting when open or where center pivoting would throw the upper half of the sash in conflict with piping, sway bracing or other interior obstructions. If required, so specify.

All butts shall have ⅝" solid steel bolts equipped with washers and nuts; each pin shouldered to insure constant, free and easy ventilator operation.

(L-5b) Operator Provisions—All ventilators shall be provided with solid rolled steel Z bar brackets, triple machine riveted to ventilator sill for attachment of operating hardware.

(L-6) Detached Hardware

Note: See Fenestra Page 40.

(L-6a) All detached hardware shall be shipped carefully packed to prevent damage until applied for use.

Note: Select type desired.

(L-6b) Provide malleable iron cam latches and rolled steel stay bars.

(L-6c) Provide malleable iron cam latches, chain, chain catches and pulley brackets.

(L-7) Mechanical Operators

Note: Specifications for mechanical operators are given on Fenestra Pages 49 to 53.

(L-8) Erection

Note: Include in the Masonry Specifications that all masonry openings shall be accurately constructed in accordance with the standard Fenestra installation details so that windows can be erected in prepared opening. (See Fenestra Page 35.)

Note: Include in the Masonry Specifications that all mortar grouting, pointing, etc., shall be done by the Mason Contractor after windows have been erected.

(L-8a) All Horizontally Pivoted Windows shall be erected in preparing openings by the Fenestra Construction Company, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(L-8b) All windows shall be set plumb and true, properly aligned and securely anchored before glazing.
Standard Fenestra sill anchors shall be used under the following conditions: (Use 2 clips for windows up to 6'-6" wide and 4 clips for windows over 6'-6").
(1) In all cases where a ventilator comes at the sill of the window, regardless of the window width.
(2) In all cases where the window is over 5'-0" wide, regardless of the location of the ventilators.
(3) In all multiple unit openings where mullions are not anchored into the sills.
All ventilators shall be properly adjusted before glazing.

(L-8c) Apply all hardware in accordance with the manufacturer's directions.

(L-9) Painting

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:
One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the Fenestra Construction Company (see Paragraph 5, Fenestra Page 1) at a reasonable added cost, will do field painting after erection. If required, so specify here, including specification for paint and its application.

(L-10) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(L-10a) Glass—Glass shall be (¼" rough wire) (¼" factory ribbed) (⅛" factory ribbed) (double strength).

Note: ¼" thick glass is recommended. Single strength glass is not recommended.

(L-10b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(L-10c) Glazing—All Horizontally Pivoted Windows shall be glazed from the inside. All glass shall be set in a bed of putty and secured by copper plated, steel spring, glazing clips furnished by the window manufacturer. (4 clips for each fixed light and 6 for each ventilator light.) Face putty shall be applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. See note paragraph (L-9).

(L-11) Screens

Note: Special metal pivoted ventilator screens may be used. These lie close to the ventilator, the upper half outside, the lower half inside, with insect-proof closures at ventilator pivot line. Screens are not ordinarily included by the window manufacturer and should, therefore, be provided for under another division of the specification.

▲MISCELLANEOUS▲

THE MULLIONS SHOWN WITH THESE DETAILS HAVE THE STEM TURNED OUT. IT IS ADVISABLE TO DO THIS AS GREATER STIFFNESS IS SECURED.

WITH STEEL WORK THIS IS ESSENTIAL IN ORDER TO AVOID NOTCHING OF THE STEEL OR A SPECIAL CUT-OFF OF MULLIONS.

ANCHORING MULLIONS AT SILL AS SHOWN IS RECOMMENDED.

▲SCALE: 3"=1'-0"▲

(P) CONTINUOUS TOP HUNG WINDOWS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Structural Steel Truss spacing, best adapted to the use of standard Continuous Window units, is in multiples of 4′ (16′, 20′, 24′) to accommodate standard 4′ centering for girt butt attachment.

Note: Intermediate structural vertical members should be provided approximately 8′ to 12′ apart.

Note: Structural Steel Girts, at heads and sills of Continuous Windows, are not furnished by the Window Manufacturer, and are so noted on the window details. These girts should be provided for in the Structural Steel Specifications including punching for attachment of window butts in accordance with standard Fenestra punching details. (See Fenestra, Page 45.)

Note: Sheet metal flashing at heads, sills, and ends of runs at building construction, is not furnished by the Window Manufacturer, and is so noted on the window details. This flashing should be provided for in the Roofing and Sheet Metal Specifications.

(P-1) Work Included

Note: List and locate. (See paragraph 13, Fenestra Page 2.)

(P-2) General

Continuous Top Hung Windows shall be *Fenestra* as manufactured by Detroit Steel Products Company.

Note: Fenestra Continuous Windows are particularly designed for use in monitor and sawtooth roof construction where the plane of the windows is on a slope. They may be used in vertical planes where necessary. The chief advantage of this type of window lies in the fact that it provides for an easily and rapidly operated continuous opening from one end of the building to the other.

Note: Standard units of Continuous Windows measure 20′ in length (dimension points equal the clear opening). We recommend, for the economical arrangement of operator arms and to permit girt punching on even 4′ centers for butt attachment, that units vary on multiples of 4′ (8′, 12′, 16′). Smaller units may be used, if necessary, in widths varying in multiples of 2′ (8′, 10′, 12′, 14′, 16′, 18′).

(P-3) Materials

(P-3a) Window Sections—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

(P-3b) Head and End Jamb Members—Head and end jamb members shall be special angles.

(P-3c) Muntins—Muntins shall be special Ts 1⅝″ deep.

(P-3d) Sills—Sills shall be special design sections with a long down-standing leg bent at the end to make close contact with the building construction. Provide weep holes for drainage.

(P-4) Construction

(P-4a) Window Units—All members of the window shall be accurately fitted and rigidly riveted at the joints to form standard panel units. Panels shall be joined, end to end midway between T muntins, by splice plates bolted to head and sill members.

Note: Panels are joined at the time of erection.

Note: Riveted assembly assures a strong, tight joining of members, with sufficient flexibility to withstand unusual strain thus obviating the danger of breaks due to imperfect welds.

(P-4b) Stationary End Sections—At the ends of all swing sections next the building construction there shall be provided stationary 1′ panels.

(P-4c) Stationary Intermediate Sections—Between the ends of swing sections there shall be provided stationary 2′ panels.

(P-4d) Weathering Caps—The joint between ends of swing sections and stationary end sections (and stationary intermediate sections) shall be covered and protected by a specially formed, 14 gauge, steel channel with one leg secured to the end angle of the swing section and designed to overlap the end angle of the stationary section.

(P-4e) Storm Panels—Where so indicated, provide 2′ wide storm panels secured to stationary end (and intermediate) panels with a steel plate and to the sill by sill clips. Panels shall underlap the swing window section and shall be provided at sill with a formed continuous drip board, set over the sill flashing.

(P-5) Attached Hardware

Note: Attached at factory.

Butts—All Continuous Windows shall be top hung on heavy malleable iron butts, with ⅜″ brass pins, spaced 4′ apart on centers. Butts shall be rigidly riveted to the head angle and furnished with bolts for attachment to the building girts.

(P-6) Mechanical Operators

Note: Specifications for mechanical operators are given on Fenestra Pages 49 to 53. In selecting type best adapted to the particular conditions, we advise consultation with our representative.

(P-7) Erection

All Continuous Windows shall be erected by the Fenestra Construction Company, under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

All windows shall be erected in a thoroughly, workmanlike manner ready for glazing.

(P-8) Painting

All windows shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the Fenestra Construction Company (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.

(P-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications:

Note: See Paragraph 10, Fenestra Page 2.

(P-9a) Glass—Glass shall be (¼″ rough wire glass).

(P-9b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See paragraph 11, Fenestra Page 2.

(P-9c) Glazing—All continuous windows shall be glazed from the outside. All glass shall be set in a heavy bed of putty and secured at muntins and end angles by angle clips secured with bolts. Face putty at sills, applied in a neat, clean-cut, smooth manner.

Note: Do not paint until putty has thoroughly hardened. (See note Paragraph P-8.)

Continuous Fixed Windows

Note: The specification for Continuous Fixed Windows is the same as that for Continuous Top Hung Windows except that all window units are stationary (no swing sections). Heavy steel angle clips bolted to the window head and the building girts are substituted for the butts. Steel sill clips, furnished with the window and shipped flat, are bolted to the sill of the window and bent around the steel sill girt to rigidly secure the window in position at the bottom.

Continuous Bottom Hung Windows

Note: In general the specification for Continuous Bottom Hung Windows is the same as that for Continuous Top Hung Windows except in the following particulars:

(a) The head section is a special T.

(b) The sill section is a special angle designed to take the butts attached to a special sill girt.

(c) The weathering caps are attached, with the legs out, to the fixed end or intermediate panels instead of to the swing sections.

(d) The windows are glazed on the inside with face putty at both head and sill.

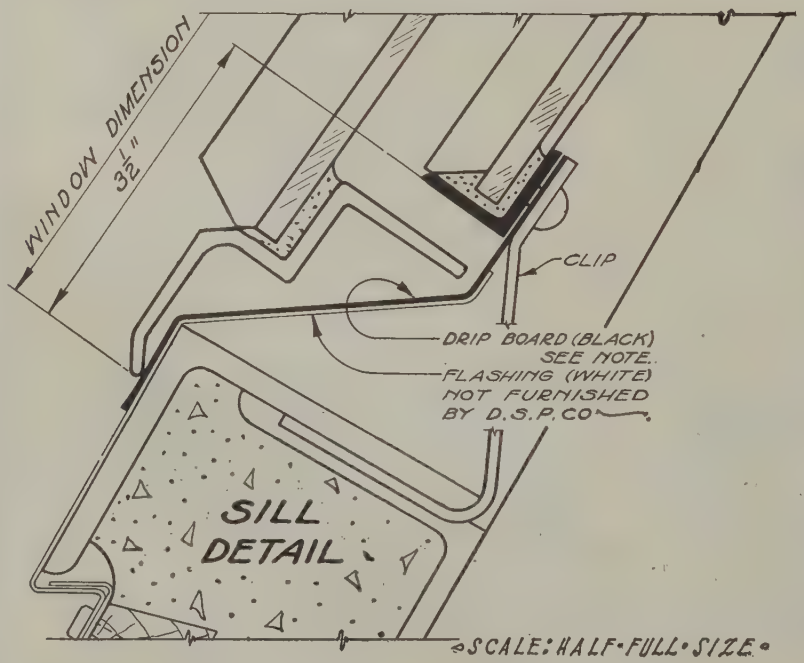
TYPICAL HORIZONTAL SECTION THRU STORM PANEL



NOTE

Storm panels can be used only with top hung windows. They are recommended only for windows 30° or less off the vertical.

When panels are used in front of vertical steel members or diagonal bracing a clear distance of not under 4 in. must be used.

A drip board (shown in black at sill) is furnished as part of panel. This drip should not be confused with flashing at sill which is not furnished by Detroit Steel Products Company.

The height of glass in panel is equal to window dimension minus 4 in. The glass width is 1 ft. 11½ in.

Continued on next page

MECHANICAL OPERATING DEVICES

While the designing of mechanical operators for the various types of Fenestra windows is not in any sense complicated, so many different building conditions are encountered that it is impossible to lay down hard and fast rules, limits and specifications which the architect may use without first consulting a Fenestra representative.

The following specifications and plates therefore should be regarded as explanatory and advisory only.

Fenestra operators are not sold as separate and distinct products, but rather as a method of securing the satisfactory opening and closing of Fenestra windows by mechanical means. Therefore, any mechanical operators recommended by Fenestra representatives are just as dependable as the Fenestra butt or cam handle or any other standard device which the architect himself might specify.

All operating equipment, and especially electrically controlled equipment, needs occasional inspection and lubrication. Therefore, provision should be made by which powers and motors may be reached without undue inconvenience. A "cat walk" or a movable platform is suggested where ladders are impractical.

A plate door is sometimes installed in the fixed panels between the runs of Continuous Windows so that the powers may be reached from the roof. Such doors may be had at added cost if specified.

(SA) WORM AND GEAR OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

***Note:** This operator is designed primarily for horizontally pivoted ventilators but may, in some cases, be used on top pivoted ventilators.*

(SA-1) Work Included

***Note:** List and locate. (See paragraph 13, Fenestra Page 2.)*

(SA-2) General

All operators, so indicated, shall be *Fenestra* Worm and Gear as manufactured by Detroit Steel Products Company.

(SA-3) Material

(SA-3a) Power—Power shall be a machine cut, cast iron worm operating a cast iron segmental worm gear assembled in a steel power housing designed for adjustable attachment to the supporting bracket. The worm shall be equipped with a ball thrust bearing to eliminate friction. The hub of the segment gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. Power shall be supported on heavy steel brackets adapted to rigid attachment to the building construction.

***Note:** Power may be erected in an inclined or inverted position to clear cranes, pipes or other obstructions.*
***Note:** The power may be located at either end of the run or at any intermediate point. Recommended limits are given on Fenestra Page 55.*

(SA-3b) Power Transmission—Power line shall be 1″ black, wrought iron pipe joined into a continuous line by steel pipe plugs, with a drive fit, riveted in two directions. Line shall be supported on adjustable steel brackets, bolted to the window mullions or to the building construction. Adjustable steel operating arms (one to each ventilator) shall be rigidly clamped to the line and pivoted to steel arm extensions attached to the ventilators through steel hinge brackets.

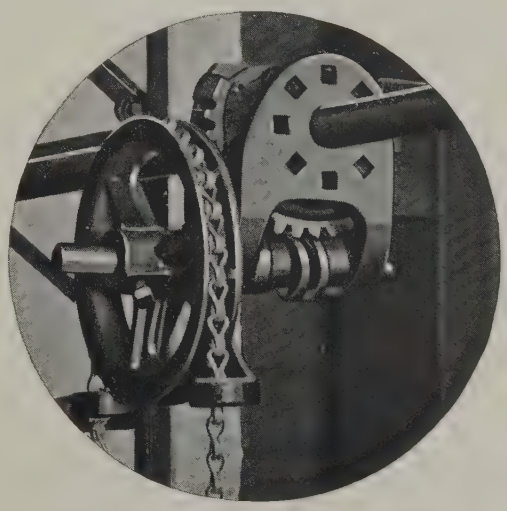
(SA-3c) Manual Operation—
***Note:** Select type.*

(1) ***Chain***—Power shall be operated by a chain, operating over a chain wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the flattened end of the worm shaft and shall be secured by a set screw. A cotter pin through end of the shaft shall be provided for additional protection.

***Note:** When the power must be erected in an inclined or inverted position (see Note SA-3a) to clear obstructions or to make the ventilators visible from the operating station, chain may be carried over idlers to any convenient point.*

(2) ***Pipe***—Power shall be operated by a 1″ black, wrought iron pipe connected to the worm shaft and carried down vertically to a miter gear (with removable crank) encased in a gear box adapted to rigid attachment to the building construction approximately 4′ above the floor.

***Note:** When the power is installed in an inclined or inverted position (see Note SA-3-a) the pipe may be offset through the use of universal joints.*



Power for Worm and Gear Operator

(SA-4) Painting

All operators shall be painted one (1) coat of red mineral paint by the manufacturer before shipment.

***Note:** Further painting should be provided for in the Painting Specifications.*

***Note:** Where desired, the Fenestra Construction Company (see Paragraph 5, Fenestra Page 1), at reasonable added cost will do field painting after erection. If required, so specify, including specifications for paint and its application.*

(SA-5) Erection

All operators shall be erected by the Fenestra Construction Company.

***Note:** See Paragraph 5, Fenestra Page 1.*

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

(SB) RACK AND PINION OPERATOR—Specifications

Notes are explanatory or advisory only, and need not be included in the specifications.

***Note:** This operator is primarily adapted for use on ventilators pivoted 4″ from the top, but can be used successfully on horizontally pivoted ventilators.*

(SB-1) Work Included

***Note:** List and locate. (See Paragraph 13, Fenestra Page 2.)*

(SB-2) General

All Operators, so indicated, shall be *Fenestra* Rack and Pinion as manufactured by Detroit Steel Products Company.

(SB-3) Material

(SB-3a) Power—

***Note:** Three types of power are available. Select and specify that best adapted to the condition.*

***Note:** Power may be located at either end of the run or at any intermediate point of the run. Recommended limits are given on Fenestra Pages 56 and 57.*

(1) ***Light Power***—Light Power shall be a 32 to 1 reduction, machine cut steel, worm operating a semisteel worm gear

(Continued on Fenestra page 50)

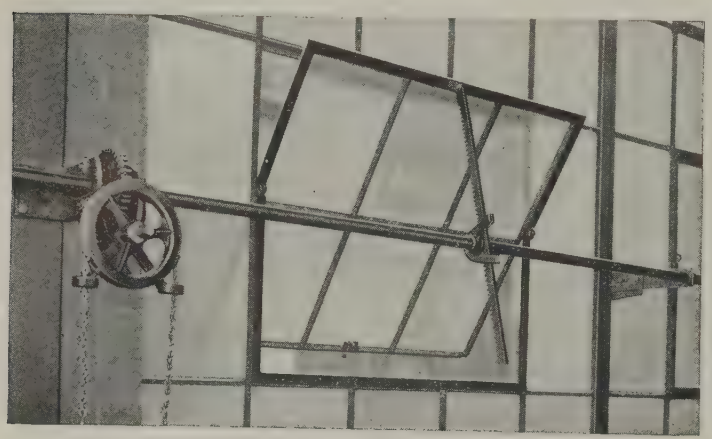
Continued on next page

assembled in a steel power housing designed for adjustable attachment to the supporting bracket. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. Power shall be supported on a heavy steel bracket adapted to rigid attachment to the building construction.

Note: Power may be erected in an inclined or inverted position to clear cranes, pipes, or other obstructions.

(2) ***Heavy Power***—Heavy Power shall be a 45 to 1 reduction machine cut, steel worm operating a semisteel worm gear assembled and oil-encased in a dustproof gear box. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line to which it shall be securely attached so as to rotate the line on the gear axis. Power shall be supported on a heavy steel bracket adapted to rigid attachment to the building construction.

Note: Power may be erected in an inclined or inverted position to clear cranes, pipes, or other obstructions.



Rack and Pinion Operator, Manually Controlled

(3) ***Electrical Power***—Electrical Power shall be a 71 to 1 reduction, machine cut, steel worm operating a semisteel worm gear assembled and oil-encased in a dustproof gear box. The worm shall be equipped with a ball thrust bearing to reduce friction. The hub of the gear shall be reamed to fit the power transmission line and shall be so rigidly secured as to rotate the line on the gear axis. The power shall be operated by a cast iron sprocket wheel keyed to the worm shaft and motor driven through a chain drive. The electrical equipment shall be mounted directly beneath and joined to the power gear case forming a complete power unit. The power unit shall be supported on heavy steel brackets adapted to rigid attachment to the building construction.

Note: Complete specifications of Electrical Equipment are given on Fenestra Page 53 and should be included here.

(SB-3b) Power Transmission—Power Transmission lines shall be 1" black, wrought iron pipe joined into a continuous line by steel pipe plugs, with a drive fit, riveted in two directions.

Lines shall be supported on adjustable, steel brackets, bolted to window mullions or to building construction.

Operating arms (one to each ventilator) shall be straight steel racks, clamped in mesh with pinions, rigidly secured to the line. (Arms shall be attached at the head of horizontally pivoted ventilators to pressed steel hinge brackets, and shall pull in.) (Arms shall be attached at the sill of top pivoted ventilators to Z bar brackets through pressed steel hinge brackets and shall push out.)

Note: Specify either or both arm attachments as required.

(SB-3c) Manual Operation—

Note: Select either type for "Light" or "Heavy" Power. Omit if Electric Power is used.

(1) ***Chain***—Power shall be operated by a chain operating over a chain-wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the flattened end of the worm shaft and shall be secured by a set screw. A cotter pin through the end of the shaft shall be provided for additional protection.

Note: When the power must be erected in an inclined or inverted position (see Note SB-3a) to clear obstructions or to make the ventilators visible from the operating station, the chain may be carried over idlers to any convenient point.

(2) ***Pipe***—Power shall be operated by a 1" black wrought iron pipe connected to the worm shaft and carried down vertically to a miter gear (with removable crank) encased in a gear box adapted to rigid attachment to the building construction approximately 4' above the floor.

Note: When the power is installed in an inclined or inverted position (see Note SB-3a), the pipe may be offset through the use of universal joints.

(SB-3d) Electrical Operation—Power shall be electric, motor operated.

Note: See Electrical Power (SB-3a3).

(SB-4) Painting

All operators shall be painted with one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired, the Fenestra Construction Company, *(see Paragraph 5, Fenestra Page 1,) at reasonable added cost, will do field painting after erection. If required so specify here, including specifications for paint and its application.*

(SB-5) Erection

All operators shall be erected by the Fenestra Construction Company.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect operating condition.

(SC) SCREW TYPE OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

Note: This operator is designed primarily for use on exceptionally high openings such as those in power houses, entirely filled with windows and structural mullions. It may be used on either horizontally pivoted ventilators or ventilators pivoted 4" from the top in individual bays, either within or beyond reach from the floor. The operator lies close to the inside face of the window out of the way of cranes and other obstructions. Where so provided for, powers and electrical mechanism may be concealed within the wall.

(SC-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2.)

(SC-2) General

All Operators, so indicated, shall be *Fenestra* Screw Type as manufactured by Detroit Steel Products Company.

(SC-3) Material

(SC-3a) Power—

Note: Two types of power are available. Select and specify that best adapted to the condition.

Note: The power may be located at either side of the opening or at any intermediate point. Recommended limits are given on Fenestra Pages 58 and 59.

Note: In bays of extreme width and height, flexibility of ventilator control may be secured by operating the upper runs from one power and the lower runs from another.

(1) ***Manual Power***—Power shall be applied through open bevel gears to operate a ¾" vertical threaded, steel shaft in an upward and downward direction.

Note: The operation is similar to that of an automobile jack.

Continued on next page

Gears shall be operated by a hand wheel provided with a handle.

The power shall be assembled within and shall be supported by an open, cast iron housing adapted to rigid attachment to the window mullion or building construction.

Provide a guide secured to the vertical shaft which shall fit over a guide T, attached to the window mullion. Guide T shall be provided with stops which shall limit the travel of the guide and shaft.

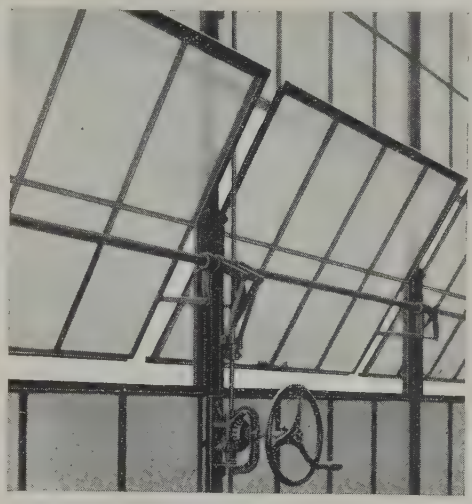
(2) ***Electrical Power***—Power shall be applied through bevel gears to operate a ¾" vertical threaded, steel shaft in an upward and downward direction. The gears shall be assembled and oil-encased in a dust-proof gear-box. Gears shall be operated by electrical power either direct connected through a universal joint or by means of a cast iron sprocket and chain drive.

The electrical equipment and the gear case shall be mounted to form a complete unit on a heavy steel bracket plate adapted to rigid attachment to the building construction.

Note: Complete specifications of Electrical Equipment are given on Fenestra Page 53 and should be included here.

(SC-3b) Power Transmission—Power transmission lines shall be 1" black wrought iron pipe joined into a continuous line by steel plugs, with a drive fit riveted in two directions. Lines shall be supported close to the face of the window on heavy cast iron brackets rigidly attached to the mullions and building construction. Cast iron pivoted lever arms (two to each ventilator) shall be rigidly clamped to the power lines and attached to the ventilator jamb bars with malleable iron hinge brackets.

Heavy cast iron cross heads, secured to the vertical power shaft, shall operate attached cast iron rocker arms rigidly clamped to the power lines. When the power is applied the rocker arms shall rotate the power lines.



Screw Type Operator, Manually Controlled

(SC-4) Painting

All operators shall be painted with one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired the Fenestra Construction Company *(see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specifications for paint and its application.*

(SC-5) Erection

All operators shall be erected by the Fenestra Construction Company.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

(SD) TENSION OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Tension Operators are in general design and operation similar to Continuous Operators. They are made for use on long runs of horizontally pivoted windows. The chief difference is in the design of operating arms and the chief advantages lie in its easy operation and the fact that windows up to 300' may be operated from one power.

Note: To avoid repetition where the specifications are the same as that for Continuous Operator this is so noted. Where not identical, use clauses here given. For specification for Continuous Operator, see Fenestra Page 52.

(SD-1) Work Included

Note: Same as (SE-1).

(SD-2) General

All horizontally pivoted ventilator operators, so indicated, shall be *Fenestra* Tension Operators as manufactured by Detroit Steel Products Company.

(SD-3) Material

(SD-3a) Power—

Note: Same as (SE-3a).

(SD-3b) Stops—

Note: Include only where Manual operation is used.

On either side of the power case, the worm shaft shall extend to receive rigidly attached, double, steel, stop clutches (two in all). As the operator opens the window an auxiliary stop attached to the rack shall strike the upper end of a steel lever (pivoted to a bracket on the power case) causing the lower end of the lever (which is broached over the worm shaft) to engage one of the stop clutches and cut off the power. When the operator closes the window, a similar arrangement shall function to automatically cut off power at the proper point. Levers and clutches for each stop shall be automatically disengaged by coil springs. No stop which merely halts the movement of the power line without cutting off the power will be accepted.

(SD-3c) Power Supports—

Note: Same as (SE-3c).

(SD-3d) Power Transmission—

Note: Same as (SE-3d).

(SD-3e) Operating Arms—Operating arms shall be adjustable, straight, steel channels. Arms shall be rigidly attached, through a malleable iron and steel universal swivel clamp, to the tension line and the other end shall be secured to the top of the window through a steel pivoted hinge. Arms shall operate to pull the window in from the top.

(SD-3f) Manual Operation—

Note: Same as (SE-3f).

(SD-3g) Electrical Operation—

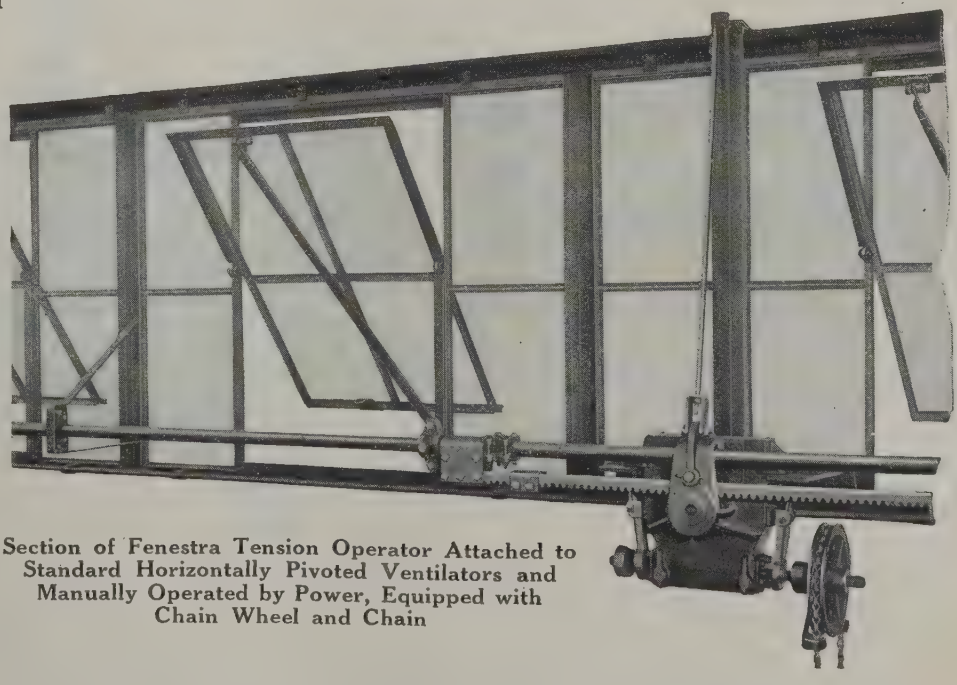
Note: Same as (SE-3g)

(SD-4) Painting

Note: Same as *(SE-4).*

(SD-5) Erection

Note: Same as (SE-5).



Section of Fenestra Tension Operator Attached to Standard Horizontally Pivoted Ventilators and Manually Operated by Power, Equipped with Chain Wheel and Chain

Continued on next page

(SE) CONTINUOUS OPERATOR—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: This operator is designed to operate from a single power, one or several continuous windows in line (top hung, or bottom hung) located in either vertical or sloping planes.

Note: The power developed through the tension line is applied to the window through straight motion levers so arranged that the leverage increases faster than the load thus making the operation continuously easier as the window opens. This is a basic principle exclusive in Fenestra Continuous Operator.

Note: The unusually heavy construction, and the extreme care with which all material is selected and fitted, give this power exceptional strength and reliability.

(SE-1) Work Included

Note: List and locate. (See Paragraph 13, Fenestra Page 2).

(SE-2) General

All continuous window operators shall be *Fenestra* Continuous Operators as manufactured by Detroit Steel Products Company.

(SE-3) Material

(SE-3a) Power—Power shall consist of a case hardened, machine cut, high carbon steel worm operating a special alloy, non-ferrous bronze, worm gear with straight face, machine cut teeth and extra heavy hub and rim.

Worm and gear shall be oil-encased, assembled in an accurately machined, oil-tight box. Worm and worm shaft shall be turned down from a solid steel bar. The worm shaft shall be made with long radial bearing surfaces and shall be provided with ball thrust, friction reducing bearings.

Note: The unusual length of the worm shaft radial bearing surfaces assures gear alignment and ease of operation without binding.

The worm gear shall fit tightly over a 1″ squared, steel shaft which shall extend to drive a high carbon steel, heat treated pinion in mesh with a rack.

Worm gear and pinion shall be separated by a spacer and all three shall be broached out to accurately fit the shaft with the permanence and reliability of a single piece.

The rack shall be of high carbon steel with machine-cut teeth of stub tooth design. The rack shall be suspended at each end from the power transmission tension line, by rigid rack hangers which thrust against clamps securely attached to the line, thus transmitting the power in a horizontal direction.

Note: The length of runs which may be operated from a single power can only be determined by consultation with a Fenestra representative since numerous factors must be considered, such as: the type of windows (top hung, bottom hung,, etc.), their location (vertical or horizontal plane), their height, the degree of opening desired, the time permitted for opening or closing, and, if manually operated, the effort to be exerted on the chain.

(SE-3b) Stop—

Note: Include only where Manual Operation is used.

Opposite the worm drive wheel, the worm shaft shall extend to receive a rigidly attached steel stop clutch. As the operator closes the window, an auxiliary stop attached to the rack, shall strike a malleable iron lever causing it to engage the stop clutch, and cut off the power. As the operator opens the window, the lever and clutch are disengaged automatically by a coil spring. No stop which merely halts the movement of the power line without cutting off the power will be accepted.

(SE-3c) Power Supports—Each power shall be supported by two steel brackets, especially designed to withstand great lateral pressure. Each bracket shall be rigidly attached to the building construction and shall be trussed with ½″ tension rods with adjusting U bolt hangers.

(SE-3d) Power Transmission—Power transmission (tension) line shall be 1″ black, wrought iron pipe in lengths not to exceed 20′, joined into a continuous line by solid steel plugs, with a drive fit, riveted in two directions.

Tension line shall be supported on 2″x3″ steel angle brackets with legs turned down, spaced approximately 10′ apart and rigidly attached to the building construction.

Brackets shall be slotted to permit adjustment and shall carry at their upper, outer ends, cast iron roller housings and solid steel rollers to support the tension line.

(SE-3e) Operating Arms—Operating arms or levers shall be steel angles consisting of two arms, one twice as long as the other.

Note: The operating arm assemblies are spaced in conjunction with the tension line brackets, approximately 10′ apart.

One end of the long arm shall be rigidly clamped through a universal pivoted joint, to the tension line and the other end shall be secured to the window through a universal pivoted joint bracket. One end of the short arm shall be attached through a universal pivoted joint to the top of the cast iron roller housing on the tension line support bracket, the other end being pivoted to the center of the long arm.

All universal joints shall be provided with bronze bushings.

(SE-3f) Manual Operation—Power shall be operated by a chain operating over a chain wheel. Chain shall be guided by a suitable guard. Hub of chain wheel shall be broached to accurately fit the extended, flattened end of the worm shaft and shall be secured by a set screw, a cotter pin through the end of the shaft providing additional protection.

Note: To clear obstructions or make the windows visible from the operating station, chain may be carried over idlers to any convenient point.

(SE-3g) Electrical Operation—Power shall be operated by an electrical power unit operating through a sprocket and chain. Hub of sprocket shall be keyed to the extended end of the worm shaft. Electrical power unit shall be mounted beneath and secured to the power by rigidly attached auxiliary steel brackets.

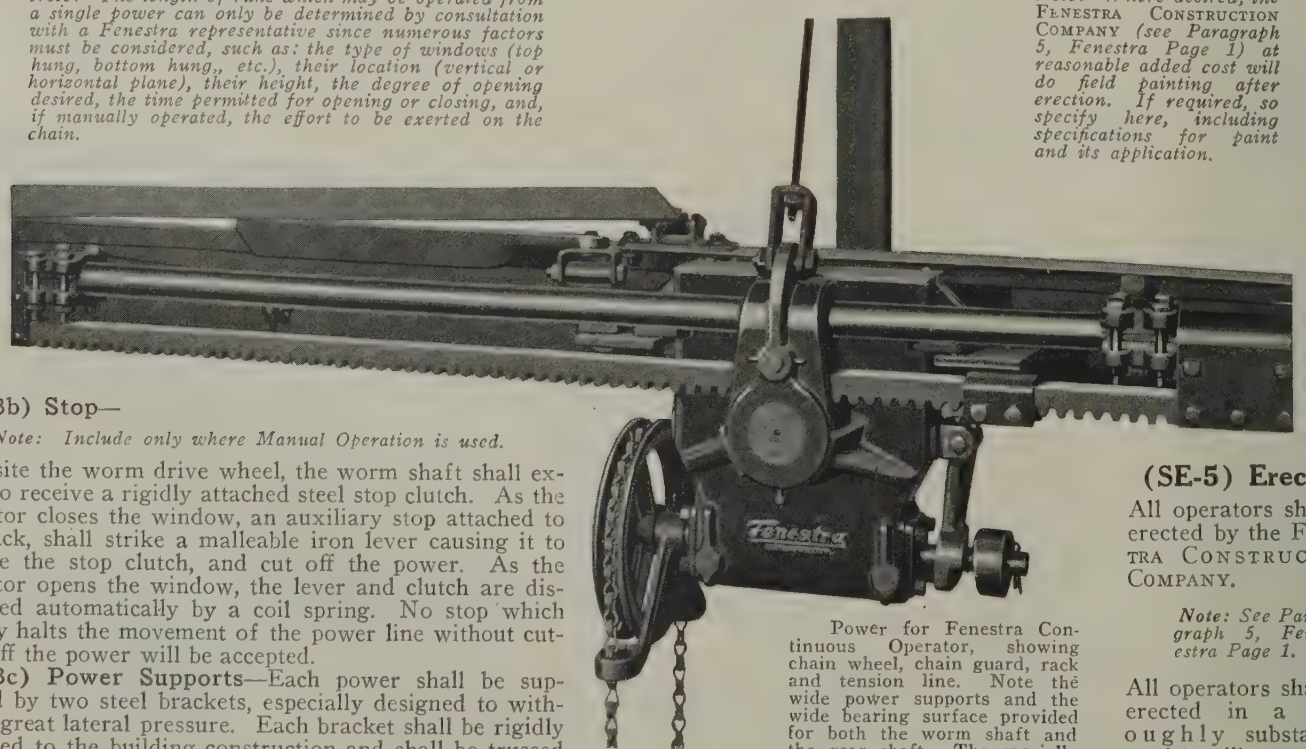
Note: Complete specifications of Electrical Equipment given on Fenestra Page 53, should be included here.

(SE-4) Painting

All operators shall be painted one (1) coat of red mineral paint by the manufacturer before shipment.

Note: Further painting should be provided for in the Painting Specifications.

Note: Where desired, the Fenestra Construction Company (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specifications for paint and its application.



Power for Fenestra Continuous Operator, showing chain wheel, chain guard, rack and tension line. Note the wide power supports and the wide bearing surface provided for both the worm shaft and the gear shaft. The specially designed Fenestra stop is shown on the worm shaft at the opposite end from the chain wheel

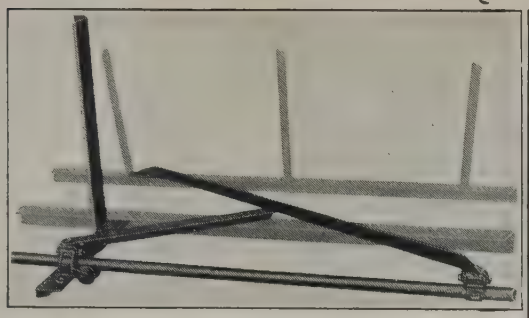
(SE-5) Erection

All operators shall be erected by the Fenestra Construction Company.

Note: See Paragraph 5, Fenestra Page 1.

All operators shall be erected in a thoroughly substantial, workmanlike manner and left in perfect working order.

Continued on next page



Above is shown a "close up" of the power transmission on Fenestra Continuous Operator. Note the 2x3 in. steel angle bracket supporting the line; the two operating arms, one twice as long as the other: one end of the long arm clamped to the pipe through a universal joint and the other attached to the window. The short arm is attached to the top of the cast iron roller housing while the other end is pivoted to the center of the long arm. For detailed description, see Paragraph SE-3e, Fenestra Page 52

At the right is shown part of two runs of Fenestra Continuous Operator as installed in the plant of the Commonwealth Steel Co., Granite City, Ill. The upper run of windows is closed while the lower run is partially open. This picture illustrates very well the operation of long runs of continuous top hung windows from a single power

CONTINUOUS WINDOW OPERATOR (CABLE TYPE)

Note: This operator is primarily adapted to use on Continuous Top Hung Windows.

The operator is designed for either hand or electrical operation and is identical to the continuous window mechanical operator except in one respect. Both ends of the transmission line are connected to chains which pass over roller bearing idlers rigidly supported on steel idler brackets (guyed to the building construction where possible) and are attached to continuous steel rods. The steel rods are carried directly beneath the transmission tension line and are supported through holes in the tension line brackets. The ends of the steel rods next the power are connected to either end of the power rack. The proper tension in rods is accomplished through turn buckles furnished in the rod lines.

In this operator the transmission line (the 1" pipe) is always in tension both when opening and closing the windows. For details, see Fenestra Page 62.

(SF) ELECTRICAL EQUIPMENT FOR OPERATORS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications

(SF-1) Work Included

Note: List and locate. See Paragraph 13, Fenestra Page 2.

(SF-2) General

All Mechanical Operators, electrically controlled, shall be provided by the Operator Manufacturer, with complete electrical equipment, as hereinafter specified. The operator manufacturer shall provide complete wiring diagrams.

(SF-3) Electrical Equipment

(SF-3a) Motors—Motors shall be of type best adapted to the power equipment, of high torque and ample horsepower.

Note: Motors operating on 220 volt or 440 volt, 60 cycle, 3 phase alternating current are recommended. Direct current motors are not carried in stock, but if alternating current is not available, a special motor for 230 volt, direct current, can be supplied.

Note: Specify current furnished.

(SF-3b) Power Connections—Motors shall be connected to power by means of sprockets and chains, or direct connected through universal joints as best adapted to power requirements.

(SF-3c) Reversing Switches—Standard Magnetic Reversing Switches shall be enclosed in steel boxes and so designed, that the movement of the ventilator, either in opening or closing may be stopped or started at any point by manipulation of push buttons.

(SF-3d) Limit Switches—Limit Switches shall be positive in action and rigidly attached to the power to form an integral part of the power unit. All limit switches shall be enclosed, yet accessible for adjustment so as to positively limit the motion of the ventilator in either direction.

(SF-3e) Push Button Stations—Push Button Stations "open," "close" and "stop" shall be of rugged construction to withstand hard usage. Buttons shall be recessed in cover so that they cannot be accidently operated.

(SF-4) Electrical Construction

Note: The following provisions should be made in the Electrical Specifications.

The Electrical Contractor shall install magnetic reversing switches and push button stations and shall furnish and install safety type, line switches. He shall also furnish all conduit, fittings and wire and do all wiring in accordance with the wiring diagram between the Electrical Equipment furnished by the Window Operator Manufacturer and that furnished by himself.

All materials and workmanship shall meet the requirements of the National Electric Code and all Local and State Inspection Bureaus.

Conduit shall be galvanized or black enameled. Wire shall be rubber covered N. E. C. Exposed conduit shall be run in a systematic, sightly manner, parallel with structural features of the building and rigidly and neatly secured. Where walls are plastered, conduit shall be concealed.

The Electrical Contractor shall carry fire, workmen's compensation, and public liability insurance. He shall guarantee his work for a period of one year after completion. Defects in the work and material furnished by him, developing during the above named period shall be promptly and satisfactorily made good at his expense.

(V) SWINGING AND SLIDING STEEL DOORS—Specifications

Notes are explanatory or advisory only and need not be included in the specifications.

Note: Both Channel and Tubular doors are made to swing or slide and in single and double units. Specify as required.

(V-1) Work Included

Note: List and locate. See Paragraph 13, Fenestra Page 2.

Note: In lists or schedules, indicate whether swing doors open "In" or "Out" and which jamb carries the hinges.

(V-2) General

All doors shall be *Fenestra* (Channel) (Tubular) Steel Doors as manufactured by DETROIT STEEL PRODUCTS COMPANY.

Note: Specify whether Channel, Tubular or both.

(V-3) Materials

(V-3a) Door Frames, etc.—

Note: We strongly recommend that all door frames be included with the Miscellaneous Structural Steel or Ornamental Iron and that they be included under these or similar other specification divisions, for the reason that the frames in all cases should be installed when the building is erected to assure rigid anchorage. Steel doors, on the contrary, should be installed only after the building is erected.

Note: Provide, therefore, that all frames shall be made to the exact dimensions furnished by the Door Manufacturer and that they shall be erected plumb, true and rigidly anchored. Include provisions for slotted, sliding door thresholds and supports for sliding door tracks where these are required.

Note: Where particularly desired, 4" channel frames for swing doors only, will be furnished with the doors at added cost. If required, so specify. (See Fenestra Page 69.)

(V-3b) Door Panels—All sections shall be specially designed, hot rolled, solid steel bars with heavy fillets in all re-entrant angles.

All panel frame members shall be (equal leg channel) (angle) sections.

Note: Channels are used for channel doors and angles for tubular doors. Include either or both as required.

Muntins shall be 1⅜" deep. Solid panels shall be of 13 gauge steel.

(V-3c) Door Stiles and Rails—

(1) Door stiles and rails shall be of heavy rolled steel channels.

(2) Door stiles and rails shall be of heavy square steel tubing.

Note: Specify either or both as required.

(V-3d) Sliding Door Closure and Guide Plates and Meeting Stile Astragals—Closures and guides (and meeting stile astragals) shall be of heavy steel plates.

(V-4) Construction

(V-4a) Door Panels—All panel frames shall be mortise and tenon, air hammer riveted, at all corners. Muntins shall be continuous from bottom to top and from side to side, so interlocked at intersections as to increase the rigidity and strength—joints at frames shall be mortise and tenon air hammer riveted. Solid panels shall be secured by angles riveted to the panel frame and muntin members.

(V-4b) Channel Doors—Channel stiles and rails shall be butted together over solid corner castings, through riveted with countersunk rivets. Stiles and rails shall be riveted to frame of panel. Door stiles shall be reinforced with a steel plate at butts.

(V-4c) Tubular Doors—Tubular stiles and rails shall be mitered and butt welded at corners. Panel frames shall be attached to stiles and rails with countersunk machine screws.

(V-4d) Closures—Closure plates at top and back edges of sliding doors shall be attached with countersunk machine screws.

(V-4e) Guides and Astragals—Guide (and astragal) plates on the face of sliding doors shall be attached with countersunk through rivets.

(V-4f) Glazing Angles—All glass shall be secured with glazing angles, neatly mitered at angles. Angles shall be secured to frames with brass machine screws and to muntins with machine screws and nuts.

(V-4g) Hardware Provisions—Stiles, where required, shall be tapped to receive hardware attached at the time of erection.

(V-5) Attached Hardware

Note: Attached at factory.

(V-5a) Butts—All swinging doors shall be equipped with standard (4½"x4½") (6"x4½") steel butts with non-risable loose pins. The number of butts to each door shall be such as to adequately carry the weight.

Note: 4½"x4½" butts are used on channel doors, 6"x4½" on tubular doors. Include either or both as required.

(V-5b) Latch-and-Locks—All swinging single doors shall be equipped with standard, bronze face, mortise latch-and-locks.

(Continued on Fenestra page 68)

Swinging Door Mortise Latch-and-lock

Swinging and Sliding Door Hardware

Continued on next page

Note: Cylinders are installed after erection.

Note: Omit if surface Japanned iron latch and strike are selected. See (V-6b).

(V-5c) Sliding Door Handles—All sliding doors shall be equipped with combination flush and projecting iron handles, one to each door, solidly riveted to the steel panels.

(V-6) Detached Hardware

Note: See Fenestra Page 67.
Note: All detached hardware shall be shipped carefully packed to prevent damage till applied for use.

(V-6a) Swing Door Cylinders and Handles—All swing doors shall be equipped with malleable iron handles, and bronze faced cylinders and escutcheons.

Note: Use when latch-and-locks are included, see (V-5b). Where master keying is necessary, we prefer to key to our own system. If cylinder master keying is required, so specify here.

(V-6b) Swing Door Latches—All swinging doors shall be equipped with surface, Japanned iron door latches and strikes.

Note: Omit if mortised latch-and-locks are selected. See (V-5b) and (V-6a).

(V-6c) Shot Bolts—All fixed leaves of double swing doors shall be equipped with standard surface, spring shot bolts (Japanned iron case and steel bolts). Top bolt shall be chain operated. Bottom bolt shall be foot operated.

(V-6d) Sliding Door Hasps—All sliding doors shall be equipped with hinged hasps and staples.

(V-6e) Sliding Door Tracks—All sliding doors shall be equipped with standard steel tracks and adjustable roller bearing trucks, complete with track brackets.

(V-6f) Special Hardware—

Note: Special hardware, such as standard fire exit panic bolts, standard door checks, etc., will be furnished where desired. If required, so specify.

(V-7) Erection

(V-7a) All Steel Doors shall be erected by the Fenestra Construction Company under a separate contract.

Note: See Paragraph 5, Fenestra Page 1.

(V-7b) All doors shall be erected in a thoroughly workmanlike manner and left in perfect operating condition.

(V-7c) Apply all hardware in accordance with the manufacturer's directions.

(V-8) Painting

All Fenestra Steel Doors shall be given one dip-coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications:

One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Note: Where desired, the Fenestra Construction Company (see Paragraph 5, Fenestra Page 1) at reasonable added cost will do field painting after erection. If required, so specify here, including specification for paint and its application.

(V-9) Glass and Glazing

Note: The following should be included in the Glazing Specifications. See Paragraph 10, Fenestra Page 2.

(V-9a) Glass—Glass shall be ¼" thick, rough wire.

(V-9b) Putty—Putty shall be a high grade of steel window putty.

Note: Ordinary wood sash putty must not be used. See Paragraph 11, Fenestra Page 2.

(V-9c) Glazing—All glass shall be bedded in putty and secured with glazing angles.

Note: Do not paint until putty has thoroughly hardened. See note Paragraph (V-8).

(Y) AIRPLANE HANGAR DOORS—Specifications

Note: Limitations.
Practical limits are determined largely by shipping facilities, height of tunnels, width of bridges, etc. Dimensions up to 8 ft. x 20 ft. are safe with 10 ft. x 22 ft. as a possible maximum.

(Y-1) Work Included

Note: List and locate.

(Y-2) General

All doors shall be Fenestra Airplane Hangar Doors as manufactured by the Detroit Steel Products Company.

(Y-3) Materials

(Y-3a) Door Frames, etc.—

Note: All framing to be included with the Miscellaneous Structural Steel or Ornamental Iron and included under other specification divisions.

(Y-3b) Door Panels—Upper panels of doors shall be provided with glass panels constructed of solid rolled steel frame sections and muntin bars of 1⅜" depth with glazing angles to secure the glass. Lower panels shall consist of solid 13 gauge steel plates.

(Y-3c) Door Stiles and Rails—All door stiles and rails shall be made of 2½x2½" steel tubing. Rails shall be solidly welded to stiles at all junctions.

(Y-3d) Weathering—Weathering between doors shall consist of rubber strips secured by continuous metal retainers to the stile of one door making contact weathering against the stile of adjacent door. Weathering at center doors shall be of steel.

(Y-4) Construction

(Y-4a) Door Panels—Frames of glass panels shall be mortise and tenon, air hammer riveted at all corners. Muntins shall be continuous from bottom to top and from side to side, so interlocked at intersections as to increase the rigidity and strength—joints at frames shall be mortise and tenon, air hammer riveted. Solid panels shall be secured to tube frame.

Note: Where glazing angles are specified all glass shall be secured with glazing angles mitered at corners. Angles shall be secured with machine screws tapped to frame, and with machine screws and nuts to muntins.

(Y-4b) Carriage—All doors shall rest on double flanged, malliron wheels so designed as to roll on steel tracks carrying the entire weight of the doors. Each wheel shall be mounted by housings and plates, and equipped with roller or swivel ball bearings and Alemite lubricated.

(Y-4c) Guides—Bronze bushed steel rollers shall be attached to the head rail of each door, to serve as guides and reduce friction, and minimize the transverse load on structural steel members.

(Y-4d) Pilot Doors—(Hinged pilot doors supplied as specified.)

(Y-4f) Swing Doors—Unless otherwise specified a swing door approximately five feet in width, to fold back against the wall, will be furnished at each end of the door opening, to provide track clearance for curved track type doors. (See plate Y-101.)

(Y-5) Attached Hardware

(Y-5a) Locks—Suitable locking hardware, such as cane bolts, etc., shall be supplied, placed at the center of each door.

(Y-6) Erection

(Y-6a) All doors shall be erected by the Fenestra Construction Company under a separate contract.

(Y-6b) All doors shall be erected in a thoroughly workmanlike manner and left in perfect operating condition.

(Y-7) Painting

(Y-7a) All doors shall be given one coat of red mineral paint by the manufacturer before shipment.

Note: The following should be provided for in the Painting Specifications: One additional coat of paint should be applied after erection and before glazing. Further painting should be deferred until at least three weeks after glazing, to permit putty to set. One or additional coats may then be applied as desired.

Note: Where desired, the Fenestra Construction Company will do field painting after erection, at reasonable added cost. If required, so specify here, including specification for paint and its application.

(Y-8) Glass and Glazing

Note: The following should be included in the Glazing Specifications.

(Y-8a) Glass shall be ¼" thick, rough wire.

(Y-8b) Putty shall be a high grade of steel window putty.

(Y-8c) Glazing—All glass shall be bedded in putty and secured with glazing angles.

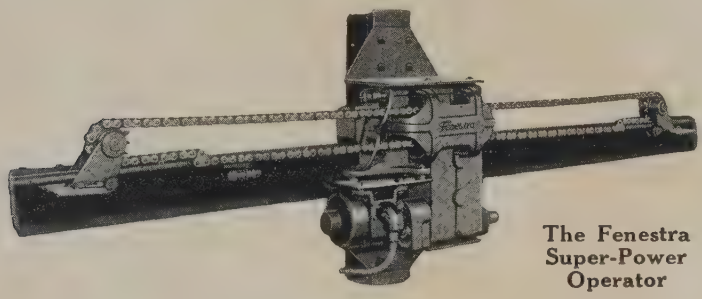
SUPER-POWER OPERATOR

For exceptionally large industrial buildings where unusual operating service is desired on long runs of continuous top hung windows, we are prepared to supply the Fenestra Super-power which, in connection with continuous operator transmission line and lever arms, will handle conveniently top hung continuous windows in runs up to 600 ft.



The Fenestra Super-Power Operator

The utmost care has been used both in workmanship and materials to produce a device that combines smooth, even, efficient action with superlative strength and durability.

The power consists of a heavy, double, spur gear reduction of especially heat treated alloy steel and a case hardened steel worm engaging a heavy, special alloy, non-ferrous bronze, worm gear. Shafts for all spur gears are of heat treated alloy steel with generously proportioned bearings. The worm shaft has, in addition, combination radial and thrust bearings of ball bearing type. The entire mechanism is enclosed in an accurately machined oil-tight case.

The power is usually located in the center of the run, operating a transmission line on either side through a heavy, continuous, roller type, chain drive. The motor is direct connected to the power by means of spur gears.

Conditions demanding the use of this super equipment are unusual. We strongly recommend consultation with Fenestra engineers who will be glad to make suggestions without obligation.

POWER AND AUXILIARY POWER

The Fenestra Power and Auxiliary Power are designed for use on any tension operator where it is desired to operate several banks or runs of sash, one above another, from the same power station. Naturally it is used chiefly with continuous operator and is equally applicable to either manual or electrical control.

The device consists of a steel pinion which moves with the main power and which is connected through a steel shaft with universal joints, to a similar pinion in mesh with a rack on each of the other runs of windows. Thus the several pinions move in unison causing the tension lines on the various runs to act simultaneously.

The width of opening and the number and length of runs naturally vary with the requirements of the job.

SPECIAL DOOR DESIGNS

Occasionally we are asked to solve some special door problem which arises in connection with buildings of unusual or peculiar design and our engineers are always glad to co-operate on such requests.

A typical example of this service was the design and manufacture of 20 Fenestra vertically sliding doors for the Detroit Seamless Steel Tube Company. These doors were operated by a worm and gear device connected by means of a steel shaft to pulleys over which the doors were counterbalanced against counterweights.

UNDERWRITERS' WINDOWS

In most buildings, standard Fenestra steel windows afford ample fire protection. Under certain conditions, however, types carrying the label of the Underwriters' Laboratories, Inc., are desirable or required.

Windows bearing the Underwriters' label are limited to 7x12 ft., either dimension being taken as height or width. Multiples of these sizes can be used to any width by the use of the standard Fenestra T-bar mullion between units, providing the width between mullions does not exceed 7 ft. and the area does not exceed 84 sq. ft.

¼-in. wire glass must be used in all panes and is limited to 48 in. in either width or height and a total exposed area of not more than 350 sq. in. Glass to be held in place by $\frac{7}{16}$ x $\frac{5}{8}$ x No. 16 gauge pressed steel angles, tapped to outside frame and ventilator frame members but bolted through all muntin bars.

Ventilators can be pivoted 2 in. above center or 4 in. down from the top to open out or may be of the projected open out type. The total area of the ventilators cannot exceed 3000 sq. in.

Each horizontally pivoted ventilator must be operated separately, either with standard cam handles and chain or with standard cam handle and stay bar, except those pivoted 4 in. from the top which must be operated by standard cam handles and stay bar only. Each projected ventilator must be operated separately by standard hardware of the cam handle type or of the kick out type for chain and pole operation and can be either iron or bronze for hand or pole operation. No other hardware except that listed can be used.

FENESTRA DETENTION WINDOWS

Fenestra Detention Windows are designed to act as a combination steel window and steel grating in prisons, asylums, hospitals and reform schools. They offer the advantages of a good weathertight, fire-resisting window with the strength of steel gratings.

Small glass lights are used, generally 7x9 in., with one pane high ventilators, pivoted 4 in. from top. Ventilators can be operated individually or in multiple runs controlled from one or more central stations.

Frequently Fenestra Detention Windows are used unglazed as gratings outside movable wood windows; in such instances only fixed light units are specified.

There are no standard types or sizes, consequently a variety of ventilator arrangements can be furnished. Large installations have been made in such typical buildings as:

Wisconsin State Penitentiary, Waupun, Wis.
Northern Insane Hospital, Norlum, Wash.
Michigan Home for the Feeble Minded, Lapeer, Mich.
Wingdale Prison, New York, N. Y.
Coquitam Asylum, Vancouver, B. C. in Canada

ACCORDION DOORS

Fenestra Accordion Doors are designed for roundhouses and buildings of that nature that require extra large door openings. Fenestra Accordion Doors are similar in appearance and construction to the Airplane Hangar Doors, but are suspended by trolley hangers which hold the doors true to line and guide them as they are opened. (See Plate on Page 74.)

The jamb hinges consist of a strap made of heavy steel which extends entirely across the door. The double eye pintle has a large steel pin. Pilot doors can be installed where desired and are constructed of 2½x2½ in. tubular trim. Pilot doors are equipped with cylinder locks while main doors are fitted with hasp and staple so they can be locked with padlock.

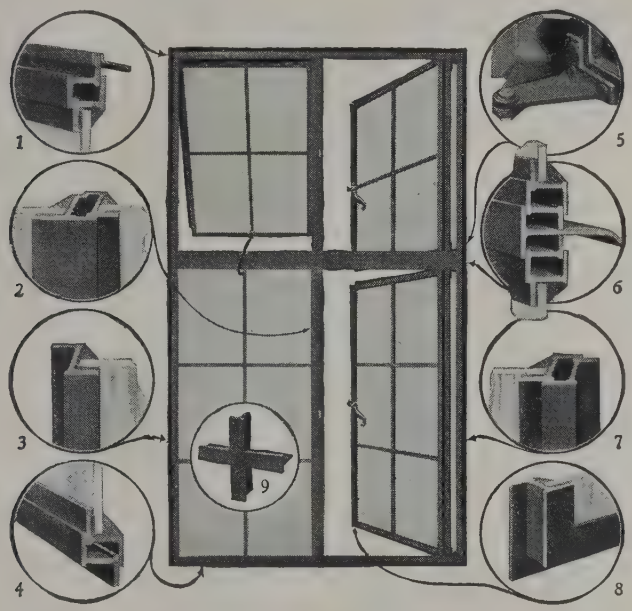
For Metal Lath, Steel Joists, and other Metal Building Specialties, see pages B1694-1695.

Model No. 5 Steel Casement

Factory built single or combination units of Model No. 5 Casements are delivered complete, ready to fill the opening and can be erected by us with a minimum of field labor, assuring complete satisfaction.

The new casements are beautiful in appearance with the latitude so desired by the architect and builder in the execution of the design. They are permanent, weathertight and foolproof, to give lasting satisfaction and greatest investment value.



Genfire Casement Construction Details—Model No. 5

(1) *Continuous Head Drip* showing the shape and proper position when attached, forming a drip over swing portions of unit.

(2) *Vertical Meeting Rail* of heavy hot-rolled section, smoothly finished on inside. Used in all combination units having both fixed and swing portions. The same detail as transom bar in combination with swing or fixed transoms.

(3) *Zee-bar Sections* used on outside frame members of all combinations and around swing portion of casement.

(4) *Sill Sections* of Zee bars affording ease of erection in any type of construction; showing the wide lap double contact for positive weathering.

(5) *Friction Type Extension Hinge* allows for the easy cleaning of windows on the outside and when adjusted has the proper amount of friction to hold the ventilator open in any desired position without the use of an adjuster.

(6) *Transom Bar,* tee section used between upper and lower units in transom combinations forming a drip over lower ventilators.

(7) *Stiles* of sash and frame of Zee sections showing the wide lap double contact and insulating air space and baffle that insures proper weathering.

(8) *Corners of Sash and Frame* are mitered, electrically butt welded and ground smooth.

(9) *Muntin Intersections* made with a mitered and mechanically interlocked joint obtaining the maximum strength of muntin bars and securing a neat, flush surface on the inside. Vertical and horizontal muntins are of the same size affording a uniform putty face and permitting a satisfactory glazed installation with plate or leaded glass.

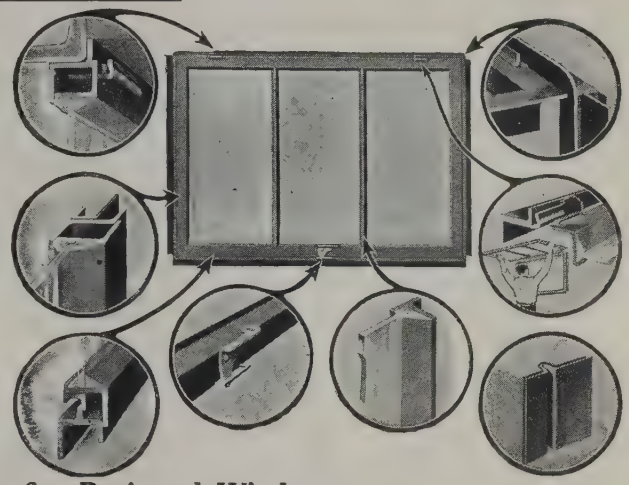
Steel Basement Windows

Genfire Basement Windows are made from hot-rolled billet steel, smoothly finished and then thoroughly painted, or may be obtained *galvanized* at slight extra cost. The narrow, extra rigid frame admits more light and the close-fitting, continuous, double contact weathering makes them weather tight. Construction details are shown above.

They are furnished complete for installation. No fitting of sash to frame, no hinges or locks to buy or no priming coat of paint to apply. They may be installed in concrete, masonry, or any other type of construction and cost less, installed, than ordinary wood windows.

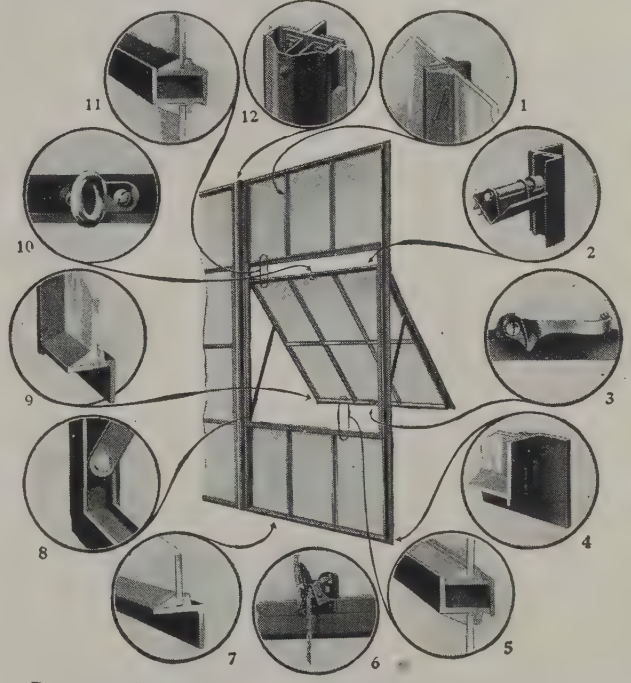
Genfire Steel Basement Windows are made in four standard sizes as follows:

Glass size	Lights wide	Window opening
10″ x 12″	3	2′ 9⅝″ x 1′ 3⅛″
10″ x 20″	3	2′ 9⅝″ x 1′ 11⅛″
14″ x 20″	2	2′ 7⅜″ x 1′ 11⅛″
12″ x 18″	3	3′ 3⅝″ x 1′ 9⅛″



Genfire Projected Windows

Genfire Projected Windows are made in two types, the commercial and the architectural. Where plain design and economy are important, the commercial type is ideal; where it is desired to have windows in keeping with architectural design such as for schools, office buildings, etc., the architectural type offers important advantages. Complete architectural details for both types of windows sent free on request.



Construction Details, Commercial Projected Window

(1) *Glazing*—Glass bed and face puttied and held in place with clips; staggered holes and flexible clips allow various thickness of glass.

(2) *Solid Brass Sliding Pivot*—Glazing bead of sash section acts as guide eliminating recess for collection of dirt and ice. Tension supplied by heavy encased coil spring.

(3) *Locking Handle*—Artistically designed of malleable iron sherardized (bronze at slight additional cost).

(4) *Corner Construction*—Mortised, tenoned and air-hammered.

(5) *Double Contact Weathering*—Section through sill at ventilator.

(6) *Automatic Chain Latch*—Automatic kick-out allows operation by chain of ventilator out of reach from floor.

(7) *Frame*—Heavy angle section at head, sill and jambs.

(8) *Heavy Brass Bushed Pivot*—$\frac{3}{16}$x1 in. supporting arm concealed when ventilator is closed.

(9) *Ventilator Frame Corner*—Rigid angle section, mortised and tenoned, air hammer riveted.

(10) *Pole Hook Ring*—To be used in conjunction with cam handle for operation of ventilator when out of reach from floor.

(11) *Double Contact Weathering*—At the head of ventilator.

(12) *Vertical Mullion*—Exterior tee bar to give necessary rigidity, with pressed metal cover on the inside to give pleasing appearance.

SALES REPRESENTATIVES IN PRINCIPAL CITIES

Products

Welded Solid Steel Windows: Pivoted, Continuous, Commercial Projected, Architectural Projected, Store Front, Basement and Utility; Ridge Ventilated Skylights; Welded Tubular Steel Industrial Doors.

Also Mechanical Sash Operators.

Federal Welded Solid Steel Windows

Federal Windows are all made from solid rolled steel sections with all joints electrically welded eliminating mechanical joints into which moisture may enter and set up corrosion. Federal units are electric arc welded in full size jigs which carry the complete unit, thereby assuring accuracy of dimension and absolute squareness. All muntin and frame faces are flat, eliminating dirt and moisture collecting ridges and reducing maintenance painting labor to a minimum.

Federal welded construction also permits of satisfactory hot galvanizing after complete fabrication in order to meet extreme conditions, as during shipment and erection handling there is no movement at the welded joints with the resultant breaking of the protective coating.

The adjustable mullion construction insures a tight weathering joint between units, simplifies erection and makes unnecessary the forcing of units to overcome slight inaccuracies in masonry openings.

Jackson Windows

Jackson Windows are designed to meet the most exacting demands of architects and engineers. They are made airtight and watertight without the use of weatherstrips and are easy to install.

Bronze for Permanence

Permanence is the outstanding characteristic of Jackson Windows. The enduring bronze of which these windows are made and their perfection of manufacture give them an unlimited term of service.

Economical

This quality of permanence, together with the fact that they require no maintenance, make Jackson Windows of solid bronze ultimately less expensive than other types. For example, the maintenance of an ordinary iron window will, in a short number of years, amount to more than the added price of a bronze window at the time of installation. In addition, the weathertightness of Jackson Windows decreases the cost of fuel. The iron window after a period of a few years begins to deteriorate and becomes more and more expensive to maintain, while the bronze window is in as perfect condition as when first installed and calls for no expense or care.

Catalogues and Service

Catalogue No. 21, "Jackson Windows of Bronze," will be sent on request.

INTERNATIONAL CASEMENTS and WINDOWS in solid rolled steel and drawn bronze.

COTSWOLD CASEMENTS and DOORS.

AUSTRAL SOLID STEEL WINDOWS.

Literature and Drawings

The following catalogues contain scale and full size details, photographs and measured drawings:

No. 6. International Austral Windows.
No. 7. International Casements (224 pages).
No. 10. International Cotswold Casements.

Specifications for International Steel Casement Windows Set to Rabbeted Wood Frames or Cut Stone

Solid rolled steel casement windows as manufactured by INTERNATIONAL CASEMENT CO., INC., or equal in the opinion of the architect. Steel sections of suitable design and weight, metal to metal contact, no loose strips. Bars hydraulically straightened, corners accurately machined, electrically welded and cleaned free from flux.

Casement manufacturer shall furnish and apply at the factory all hardware and operating devices, which shall be of solid bronze. Side hinged casements swinging out 5-ft. high and over shall have double grip bolt in addition to fastener, and side hinged casements swinging in 4 ft. 6 in. high and over shall be similarly equipped. Transoms out of reach from floor shall have operators that can be worked from the floor.

Sash shall be fitted with moulded steel glazing beads (glass stops) set with brass screws. Corners mitered and neatly fitted. All steel work cleaned free from rust and scale, painted two coats rust resisting paint, each coat separately baked on.

The casement window contractor shall set the casement sash. Frames to be bedded and pointed (inside and out) with approved mastic cement, finished in a workmanlike manner and guaranteed absolutely weathertight. If set to stone rabbets, lead expansion shields to be used.

Not included: glass, glazing, painting after erection, screens or preparation for same.

Specifications for International Steel Casement Windows Set to Masonry Reveals

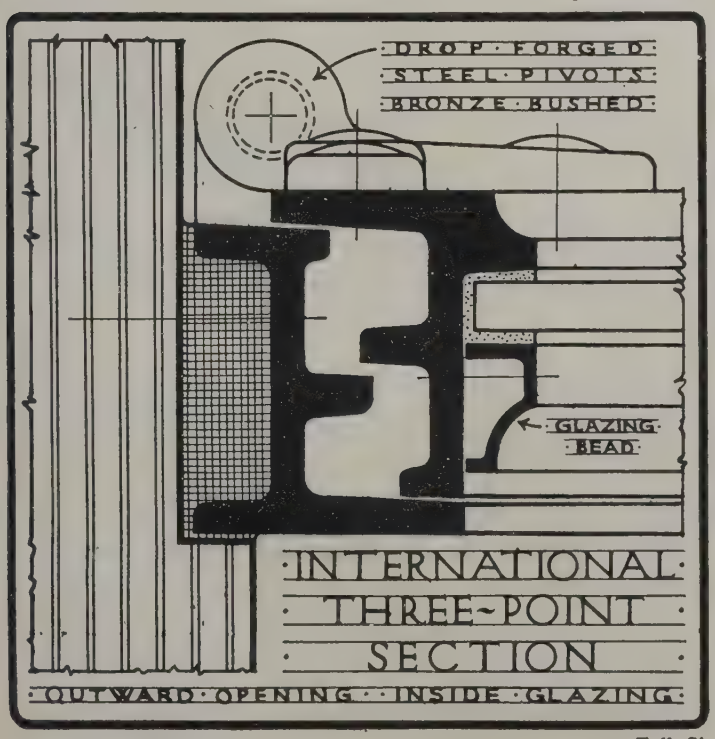
Sub-frames of pressed steel No. 12 gauge [No. 11 gauge, ingot iron] of size and contour as shown by scale details. If both dimensions exceed 7 ft. they shall be assembled at the factory, taken down and shipped knocked down. If under this size, corners shall be electrically welded and cleaned free from flux.

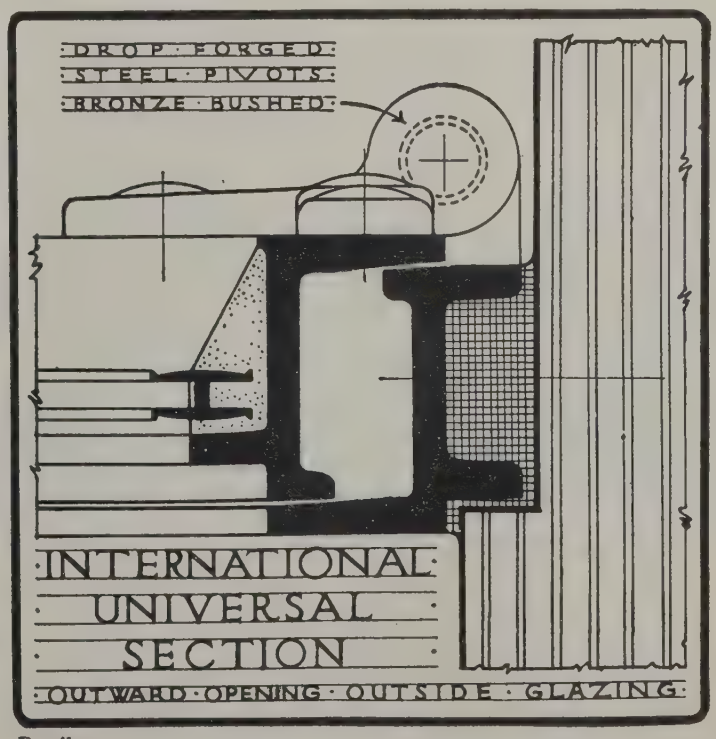
Steel work painted two heavy priming coats of rust resisting paint, each coat separately baked on.

The sub-frames are to be delivered to the building site by the casement manufacturer but must be set and built in by the mason. The masonry contractor will be required to set frames plumb and level, in close contact with masonry reveal at sides and head, and resting solidly on sill. After setting, wood spreaders or braces shall be placed in the frames to keep them true and square.

Calking—The calking between masonry and subframe to be covered under separate heading.

Casement Sash—Shall be of suitable design and weight, etc. (Copy specification.)





Full Size Details

TYPES 2S - 4S - 5S - 13S - 41F - 71F - 21 AND 31 ARE FIXED SASH AND ARE SUITABLE FOR USE IN COMPOSITE UNITS ONLY ÷ TYPES 41FA - 71FA - 21A - 42F - 31A AND 73F ARE FIXED SASH BUT ARE SUITABLE AS TRANSOM LIGHTS IN SINGLE OPENINGS ÷ ALL OTHER TYPES ARE HINGED TO OPEN RIGHT OR LEFT OR THEY CAN BE SUPPLIED AS FIXED SASH ÷ COMBINATIONS OF VARIOUS TYPES CAN BE MADE BY THE USE OF STEEL MULLION AND TRANSOM BARS

Cotswold Casement Specification

(1) Casements of Cotswold type, made from heavy two-point steel section (not Cottage Sections) hinged at side opening outwards painted two coats of rust resisting paint, each coat separately baked on, hung on drop forged steel pivots bronze bushed and fitted with solid bronze hardware of standard design.

(2) Furnish leaded glass of standard sizes and design, first quality D.S.A. glass ½-in. lead cames, all horizontal cames steel reinforced.

(3) If steel muntins are required omit paragraph 2 and specify steel muntins to be furnished.

(4) The whole to be set by sash contractor and guaranteed weathertight.

Continued on next page

INTERNATIONAL COTSWOLD CASEMENTS AND DOORS

Residence at Montclair, N. J.
FRANCIS A. NELSON, Architect
International Cotswold Casements were used in the above residence

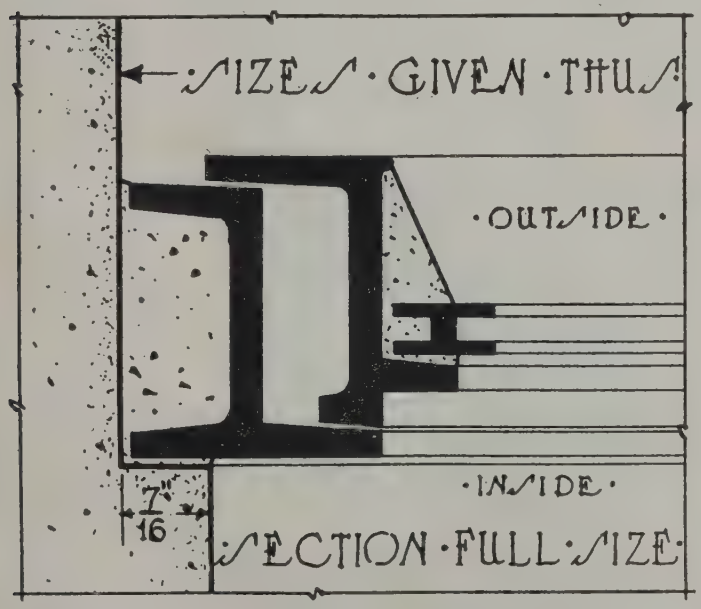
Cotswold Door Specification

(1) Doors of Cotswold type (either "L" or "M") made of heavy two-point steel sections, hinged at side opening outwards, painted two coats of rust resisting paint, each coat baked on separately, hung on drop forged steel pivots bronze bushed, having bronze intermediate hinges and fitted on the first opening leaf with bronze cremone bolt which can be operated from inside or out and security on inside by a safety catch. The other leaf being fitted with two bronze bolts, friction adjusters being supplied on each leaf. Galvanized kick panels to be provided.

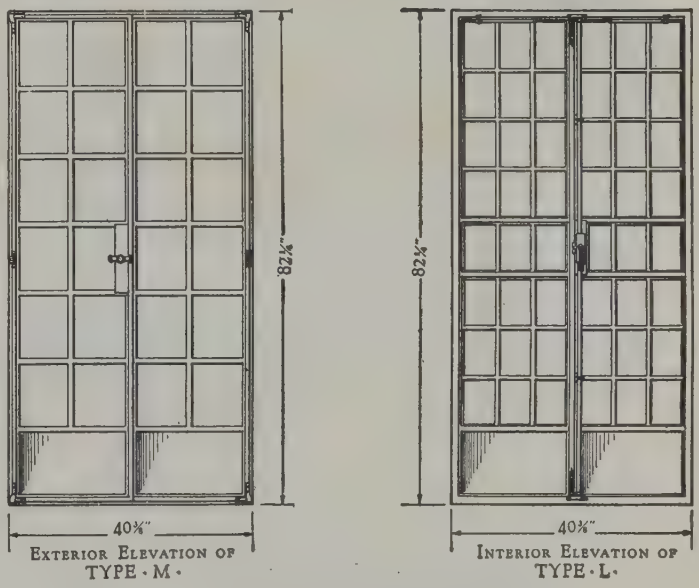
(2) (For "L" type only). Furnish leaded glass of standard sizes and design, first quality D.S.A. glass ½-in. lead cames, all horizontal cames steel reinforced.

(3) (For "M" type only). Doors to be divided into panes with rolled steel tee muntins.

(4) The whole to be set by sash contractor and guaranteed weathertight.



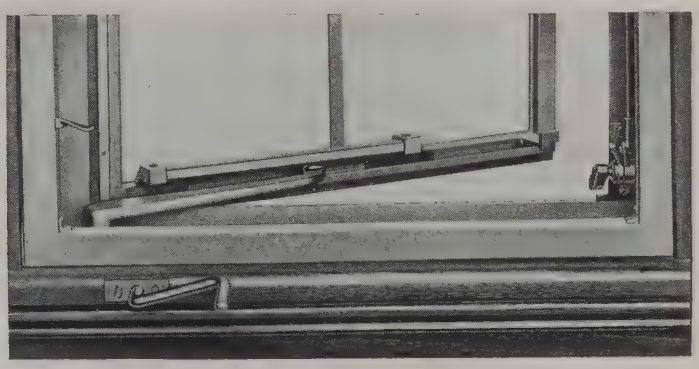
The above full size detail applies to Cotswold doors and casements. The corresponding fixed light section consists of a channel section of similar outline and gives the same sight line. Glazing angles are provided on doors Type "L" only and are optional on the casements of leaded light type. All other types have putty glazing.



Types and Sizes of Cotswold Doors

Ellison Window Operator

The Ellison window operator for out-swinging casement windows, either wood or steel, is designed to



operate through the stool of the window without opening the screen.

It is pleasing in appearance, simple and rugged in construction and foolproof in operation.

Built with ample strength to open and close the largest casement, self-locks in any position, and absolutely prevents rattling.

INTERNATIONAL AUSTRAL WINDOWS IN STEEL AND BRONZE FOR OFFICE BUILDINGS & SCHOOLS

Girls' Senior High School, Atlanta, Ga.
EDWARDS & SAYWARD, Architects

International Austral Windows

Specifications—

Windows where marked on plans to be copper-bearing steel with Austral balance arms as manufactured by the INTERNATIONAL CASEMENT CO., INC., Jamestown, N. Y. Sub-frames of No. 12 gauge steel, with welded corners, painted two priming coats, each coat separately baked on, to be delivered to building site, but same to be set up, built in and calked by mason contractor.

Sash to be of special shapes, made of copper bearing steel. All bars hydraulically straightened, corners electrically welded and cleaned from from flux.

Frames and sash carefully fitted to insure absolute weathertightness. Fit with steel glazing beads (glass stops) set with brass screws. Clean all steel work free from rust and scale and paint two heavy priming coats, each coat separately baked on.

This contractor shall furnish all necessary hardware and fittings as follows: galvanized drop-forged steel window cleaner's bolts, shade brackets for both upper and lower sash with roller guides to hold cords. Polished cast bronze automatic cam catch and pull.

The sash shall be erected by this contractor after the plastering is completed. Same to be bedded and pointed in mastic cement and secured to subframe by machine screws. All to be finished in a workmanlike manner and guaranteed weathertight.

STEEL & BRONZE WINDOWS suitable for Residences, Universities, Colleges, Public Buildings, Schools, etc.

SECTIONS as illustrated full size, based upon over 100 years' experience, provide two points of contact, with ample interior cavity to prevent capillary attraction. This system has proved weathertight in the most exposed situations throughout the world. These three sections are of universal application, and can be made to open outwards, inwards, or to pivot horizontally or vertically. We recommend as a general rule that casements should open outwards.

GLAZING & SETTING We keep a staff of fully qualified workmen, and undertake contracts including setting and glazing complete.

HARDWARE. Our hardware is of the highest class, made from BRONZE to U.S.A. Naval Specification, all working parts machined with ample bearing surfaces for everlasting wear. All hinges are of solid bronze, and horizontally and vertically pivoted casements are hung on our patent solid bronze cup pivots, which afford perfect security, easy working and exclusion of the weather.

QUALITY. We make three qualities: No. 1 fitted with Hope's bronze hardware; No 2 with iron hardware (the steel for both these qualities is finished with two coats of anti-corrosive paint); Quality No. 1A is finished with a stoved coat of enamel in addition.

HOPE'S FRENCH WINDOWS

HOPE'S STANDARD FRENCH WINDOWS ARE 6′10″ HIGH × 3′4½″ WIDE, AND ARE NOW FITTED WITH A SOLID BRONZE CREMORNE BOLT TO OPERATE FROM BOTH SIDES AND TO LOCK FROM THE INSIDE. THE PANES ARE THE SAME SIZE AS IN OUR STANDARD "L" TYPE WINDOWS, SO THAT WITH A PROPER ADJUSTMENT OF CILL LEVELS HORIZONTAL BARS WILL RANGE WITH EACH OTHER. WE ALSO MAKE THESE FRENCH WINDOWS, EXACTLY AS ABOVE, BUT WITH STEEL MUNTINS; THE PANE SIZE RANGES WITH OUR ORDINARY STANDARD WINDOWS. THESE WINDOWS ARE COMPLETE IN EVERY RESPECT AND ARE STOCKED IN NEW YORK.

WEIGHT HUNG, STANDARD CASEMENT, SPECIAL TRANSOM CASEMENT and PIVOTED TYPE WINDOWS made of Solid Nickel-Silver or Bronze.

VENTILATOR BRACKETS for controlling drafts from weight hung windows.

For Doors of solid nickel-silver and bronze, see pages A954-955.

For Store Fronts made of solid copper or bronze, see pages B2219-2225.

For Shower Bath Doors of solid nickel-silver and bronze, see page C2988.

Rustless Metal Windows

Kawneer windows are made in solid nickel-silver or bronze to meet the requirements of permanency for the better class of buildings. They are made from heavy cold rolled mouldings, all joints being mitered or coped and securely welded. With our method of forming mouldings we are able to build these windows weathertight. This reduces fuel costs and eliminates the use of weather strips. Upkeep costs are restricted to a minimum. Kawneer nickel-silver windows do not require painting on the outside but may be finished to correspond with decorative schemes.

Kawneer
SOLID NICKEL SILVER
WINDOWS

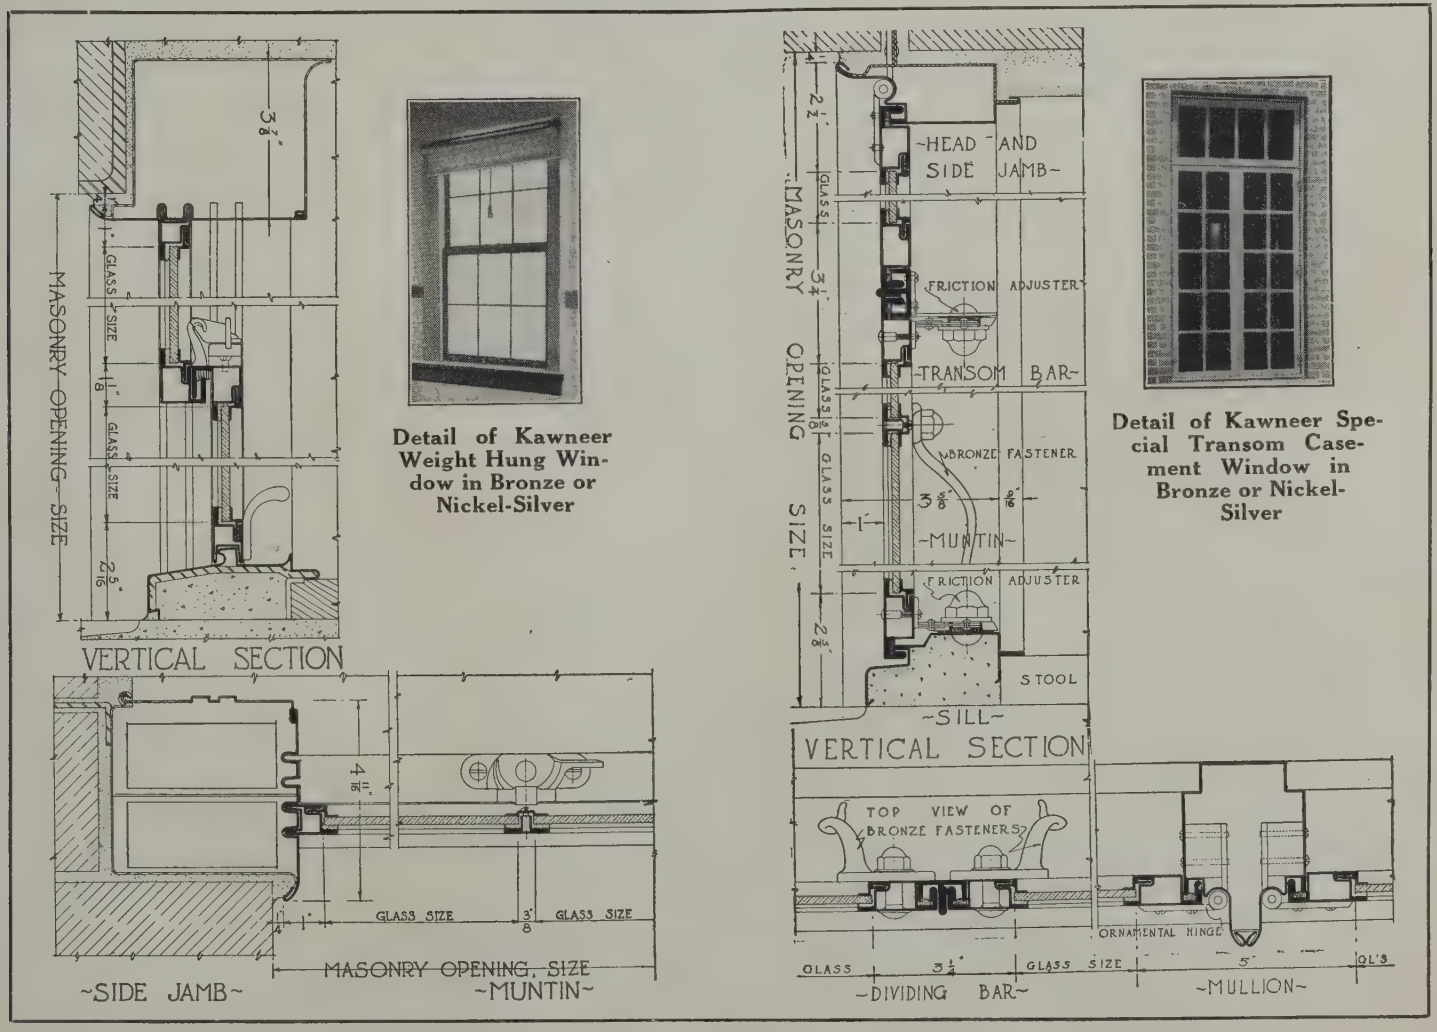
Types

Kawneer Solid Nickel-Silver or Bronze Windows are offered in standard weight hung, out swinging casements, special transom casement and pivoted types. Practically any style of the various types may be had. If desired they can be made with muntins, and in groups with mullions of corresponding metal.

Architectural Service

Information concerning Kawneer windows will gladly be furnished on request. A serviceable catalogue featuring our solid nickel-silver or bronze window has been published for the convenience of architects. The manufacturers will be glad to mail a copy of this catalogue or full size details.

Our Engineering Department will gladly co-operate with architects in solving problems concerning special window construction.



KEWANEE MANUFACTURING COMPANY

Basement Coal Chutes, Steel Basement Windows and Building Specialties

85 North Tremont Street, KEWANEE, ILL.

Nationally distributed through Dealers in Building Material, Hardware and Structural Steel

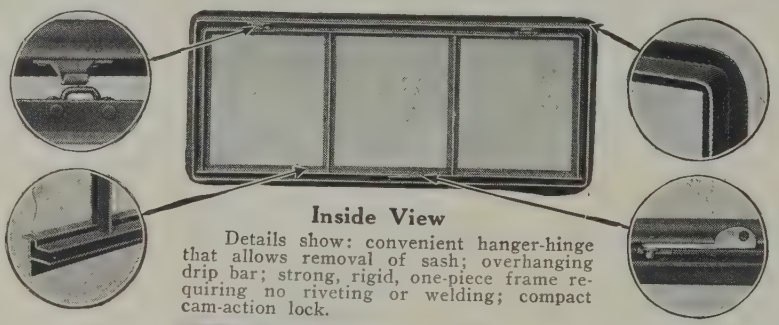
Product

KEWANEE COPPER STEEL BASEMENT WINDOWS.
For Kewanee Coal Chutes, see pages A706-707.

Kewanee Copper Steel Basement Windows

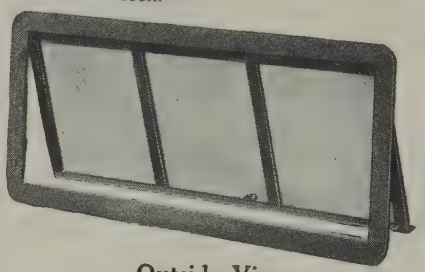
The old or new basement may be materially improved by the use of Kewanee Copper Steel Basement Windows, which will transform it into a light, airy room, readily utilized for laundry, workshop, playroom and many other purposes.

In remodeling a great opportunity is offered to modernize with Kewanee Windows. They are suitable not only for use in basements, but also for garages and a variety of other small buildings. Architects, builders and contractors recommend these improved Kewanee Copper Steel Windows because of their marked advantages.



Inside View

Details show: convenient hanger-hinge that allows removal of sash; overhanging drip bar; strong, rigid, one-piece frame requiring no riveting or welding; compact cam-action lock.



Outside View

Durable and Attractive—The strong, compact and efficient steel sections employed in Kewanee Windows admit 50% to 75% more light and air (depending upon the size of the wall opening) than the bulky wood frame and sash. Their trim, clean-cut lines add greatly to the appearance of the basement.

The Kewanee one-piece frame insures absolute rigidity with no possibility of distortion. Constructed of rust-resisting Copper Steel, Kewanee Windows are rotproof, fireproof, windproof, dustproof and verminproof, and in every way more durable than wood windows. Experts recommend steel basement windows because of the protection they provide against the ravages of termites or white ants.

Efficient and Convenient—Kewanee Windows open easily and lock securely. They never warp, bind or rattle. When closed, the hanger-hinge at the top and the cam-action lock at the bottom draw the sash and frame tightly together, all around, in a broad flat contact. This construction and the drip bar projecting over the bottom edge of the frame, make Kewanee Windows exceptionally weatherproof. When closed, the sash is firmly held in place by the hanger-hinge, but when swung open into the horizontal position it is readily lifted out for cleaning.

Furnished Complete—Kewanee Windows are shipped from factory with sash in frame, hardware attached, all coated with best metallic paint, and completely assembled in every detail (except glazing), ready to set in the openings without further preparation or fitting. Clips needed for glazing are included with each window. Screwholes in frame permit screens to be readily attached.

Easily Installed—Kewanee Windows are readily installed in any kind of construction. (Typical installations are shown below.) The sash, hinges and lock are contained entirely within the horizontal flange of the frame, which affords the workman a clean, definite masonry guide on all sides, that he can build up to without obstructions of any kind. He is not called upon to exercise any judgment as to the amount of clearance he should allow in order to insure a sightly job and free operation of the sash.

Low Cost—Standardization and quantity production have greatly reduced the cost of manufacture, so that you may now obtain Kewanee Copper Steel Windows at the same cost—installed—as wood windows.

LUPTON SERVICE

General

Lupton Service is maintained to assist you in solving your problems in daylighting and natural ventilation. We will welcome the opportunity to work with you in submitting tentative designs showing practical application of our steel windows, operating devices and skylights.

By careful study and research we have established economies in manufacturing processes, new window designs and methods of control, a broad standardization of our products and new building designs to meet requirements of various industries so that good ventilation and daylight may be provided over unlimited floor areas.

In the following pages we present information concerning our products, to assist you in the preparation of details and specifications. Irrelevant matter has been eliminated. Text is used to supplement drawings only where it is necessary to give a clear idea of construction or application of our products.

Details are typical, showing construction and general principles underlying satisfactory installation.

Lupton Products are designed to give full investment value and to this end we offer our service and co-operation in whatever degree required to obtain satisfactory results in the natural daylighting and ventilating of your buildings.

Erection Service

Where preferred, we will erect any of our products, but stock items such as Pivoted, Basement and Residence Casement Windows are more often erected by others.

All other Lupton Products, however, because of their special application should be erected by our own forces.

Glazing

It is recommended that glazing be done by others on Pivoted, Basement, Commercial and Architectural Projected and Residence Casement Windows. However, we will do glazing for any of our products when this is preferred. Steel window putty should always be used for back and face puttying. Because various climates require variations in the ingredients of satisfactory putty, we recommend that putty be obtained from local sources. When this is impossible, putty may be secured from the Lupton Company or its sales representatives.

A special is an odd size between two less expensive standards

Continued on next page

LUPTON STEEL CASEMENTS—HEAVY TYPE

Lupton Casements were designed for use in monumental buildings, educational buildings, public libraries, banks, fine residences, club houses, first class hotels and office buildings and all other buildings of the same general character. Lupton Casements are the highest form of steel window construction and are made in sizes specified by the architect. Pages following list various types of ventilator operation and show construction details. Lupton will gladly co-operate by submitting tentative designs and finished drawings.

Side Hinged Ventilators

Maximum Size (Approximate)
Width 2 ft. 9 in. Height 8 ft. 0 in.

All hinged ventilators have solid bronze butts with steel pins. Double casements are equipped with Cremone Bolts; single casements with Cam handles. Sliding adjusters are used at the sill. In severe climates swing out type should be used in preference to swing in or vertically pivoted. In addition to its superior weathering, the swing out casement, when open, does not interfere with draperies.

Projected Ventilators

Maximum Size (Approximate)
Projected-In-at-Top or Bottom-Projected-Out
Width 4 ft. 6 in. Height 2 ft. 6 in.
Side Projected
Width 2 ft. 6 in. Height 5 ft. 0 in.

Projected ventilators are held open without adjusters or stay bars by an adjustable bronze friction shoe. Locking device is Cam handle, or spring catch and pull down for pole operation.

Projected-in-at-top or bottom-projected-out ventilators are mostly used for transoms or wherever a wide shallow panel is to be operated. Side projected can be used, instead of side hinged or vertically pivoted.

Pivoted Ventilators

Maximum Sizes (Approximate)
Vertically Pivoted
Width 4 ft. 3 in. Height 8 ft. 0 in.
Horizontally Pivoted
Width 4 ft. 6 in. Height 4 ft. 6 in.

Vertically pivoted ventilators are not recommended except where the desired width is too great for a side hinged ventilator. For both vertically and horizontally pivoted ventilators, peg and stay is furnished at the sill. Locking is by means of a Cam handle for vertically pivoted. On horizontally pivoted ventilators the stay bar serves as a lock.

Top Hinged and Bottom Hinged Ventilators

Maximum Size (Approximate)
Width 5 ft. 6 in. Height 4 ft. 0 in.

These are used mostly for transoms or where mechanical operators are to be used. Page 6 illustrates the bottom hinged type used in a semicircular head.

Muntins

All the above types of ventilators as well as stationary lights may be had with muntins.

General

Mullions and imposts permit combining two or more types of units to form a composite window.

Frames of 12 gauge steel plate may be used for this purpose (see pages 7 and 8).

Case hold adjusters (friction adjusters) may be used on hinged or pivoted ventilators.

We will co-operate in working out details for mechanical operators when these are required.

Note: When viewed from the inside a left-hand casement swings in or out from right to left and a right-hand casement swings in or out from left to right.

SPECIFICATION FOR STEEL CASEMENTS—HEAVY TYPE

Steel Casements—Heavy Type

1. Furnish and install where shown on drawings, Lupton Steel Casements (Heavy Type) as manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All steel casement windows should be accurately listed and located either in schedules on plans or in specifications. If more than one type of casement or more than one type of hardware be desired, each type should be separately listed and located or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show sections of frame members, details of construction, hardware, anchoring, etc.

Materials

3. Frame and Ventilator members shall be made of copper-bearing, rust-resisting steel specially rolled in solid, one-piece sections. Bars shall be straightened and sand-blasted.

4. Muntins shall be specially designed steel T bar section.

5. Vertical mullions shall be specially designed steel H section.

6. Imposts shall be specially designed steel lug bars.

Note: Two sizes of lug bars are standard, the width of the section being 4" for the large bar and 2½" for the small one. The large bar is used for the larger multiple unit casement windows.

Construction

7. All casement windows shall be designed for inside glazing.

8. All casement windows shall be straight and true, members in alignment and surfaces in a plane.

9. Ventilator and Frame Members shall be mitered at corners and solidly butt welded. Exposed welded surfaces shall be ground smooth. The frame and ventilator shall form a two-point, flat, continuous, weathering contact.

10. Muntin Bars shall be continuous from top to bottom and from side to side between frame members or ventilator members. They shall be attached to frame members or ventilator members by tenoned, riveted joints and shall be so interlocked at their intersections as not to decrease their ultimate strength.

11. Mullions shall be provided and bolts for attachment whenever two or more units are placed side by side in an opening.

12. Imposts shall be provided and bolts for attachment whenever two or more units are placed one directly above the other in an opening.

13. At the head of all open out ventilators a No. 16 gauge formed steel hot galvanized weather bar shall be used, except when condition necessitates the use of the lug bar, the lug bar shall be bent and used as weathering bar.

Note: (a) No. 12 gauge steel fins are furnished and attached in factory only when specified, at slight added cost.
(b) No. 14 gauge steel sill and jamb anchor clips are furnished only when specified.

Glazing Stops

14. Glazing stops shall be of detail shown on window manufacturers standard drawings and shall be made of drawn rolled steel. All stops shall be accurately coped and fitted.

Note: See details on pages 9 and 10.

Standard and special sizes look alike in the walls. Save the difference in costs

Continued on next page

Hardware

15. Solid bronze hinges with steel pins shall be attached to all side-hinged casements and painted with casements in factory. Additional solid bronze hardware, as listed below shall be fitted in shop and shipped unattached carefully packed to prevent damage until applied for use.

Note: The following hardware is available, list the types required.

For Double Casements (Side Hinged—Open Out)
Sliding adjuster.
Cremone bolt and pull handle.

For Single Casements (Side Hinged—Open Out)
Sliding adjuster.
Single locking device (ventilators up to 4′ 0″ in height).
Double locking device (ventilators up to 8′ 0″ in height).
Triple locking device (ventilators over 8′ 0″ in height).

For Double Casements (Side Hinged—Open In)
Sliding adjusters.
Cremone bolt and pull handle.

For Single Casements (Side Hinged—Open In)
Sliding adjusters.
Single locking device (ventilators up to 4′ 0″ in height).
Double locking device (ventilators up to 8′ 0″ in height).
Triple locking device (ventilators over 8′ 0″ in height).

For Vertically Pivoted Ventilators
Peg and stay adjuster.
Single locking device (ventilators up to 4′ 0″ in height).
Double locking device (ventilators up to 8′ 0″ in height).
Triple locking device (ventilators over 8′ 0″ in height).

For Horizontally Pivoted Ventilators
Peg and stay adjuster.

For Projected Ventilators—Bottom-Projected-Out
Within reach from floor—Cam handle.
Beyond reach from floor—Spring catch handle and pull down for pole operation.

For Projected Ventilators—Projected-In-at-Top
Within reach from floor—Cam handle.
Beyond reach from floor—Spring catch for pole operation.

Calking Cement

16. The window manufacturer shall furnish non-staining elastic calking cement (as indicated on window manufacturer's standard details) in quantities sufficient to make head, sill, jambs, mullions and imposts weathertight. Wooden filler-strips shall be furnished and used where indicated on details.

Erection

17. All Casement Windows shall be erected in prepared openings by the window contractor (unless otherwise specified).

18. All Casement Windows shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts shall be bolted securely to frames. Calking cement and wooden filler-strips shall be neatly applied at points indicated on window manufacturer's standard details.

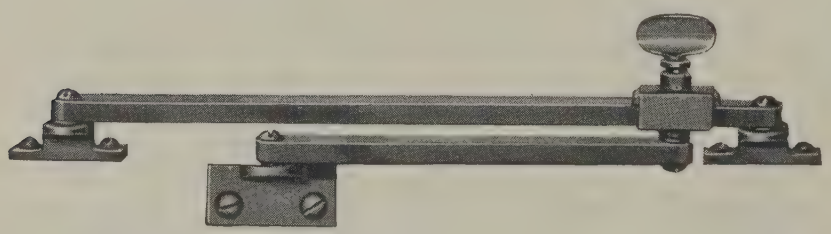
Note: Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Casement Windows. Note that when the continuous fins are built in the masonry, the placing of the furring tile at the jambs must be delayed until after the windows are set. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Glass and Glazing

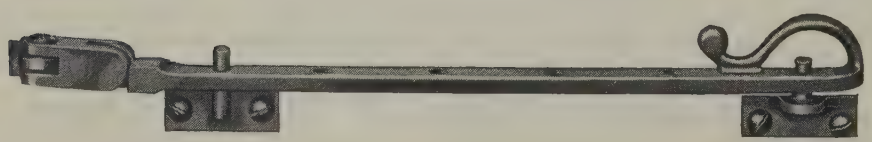
Note: Specify glass and glazing under proper heading elsewhere in general specifications of other trades.
(a) Do not specify single thickness glass.
(b) Specify a high grade steel casement putty.
(c) Specify that all casement windows shall be glazed from the inside and that all glass shall be set in a bed of putty and secured by the Lupton metal glazing stops.

HARDWARE FOR STEEL CASEMENTS—HEAVY TYPE

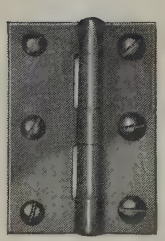
All hardware numbers are for solid bronze hardware highly polished, unless otherwise noted



Sliding Adjuster No. 231
For swing-out casements



Peg Stay No. 209
For horizontally pivoted casements. A similar peg stay No. 249 or a peg stay terminating in a scroll (No. 250) used on vertically pivoted casements



Bronze Butt No. 2200
With steel pin (not polished). Used on all hinged casements

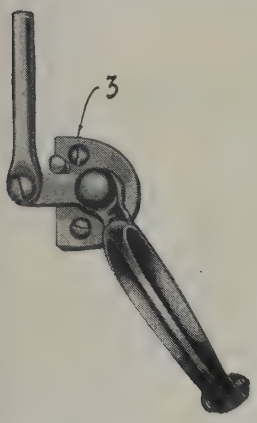
Exterior Sliding Adjuster
For swing-in casements. No. 230 for single casements up to 1 ft. 7 in. wide, or for double casements up to 3 ft. 0 in. wide. No. 229 for larger casements

Interior Sliding Adjuster No. 236
For swing-in casements

Continued on next page

HARDWARE FOR LUPTON STEEL CASEMENTS—HEAVY TYPE

All hardware numbers are for solid bronze hardware highly polished, unless noted otherwise. Cam handles, latches and spring catches are mounted either on the ventilator section or on steel plates welded to the ventilator



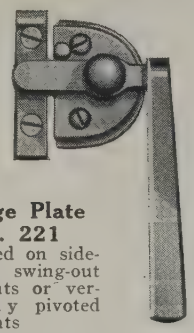
Double Locking Device
Right hand shown
Used on Side-hinged swing-out and Vertically Pivoted Casements, over 4 ft. 0 in. and up to 8 ft. 0 in. high. Consists of the following:
1. Auxiliary Latch No. 213
2. ½ in. Steel Tube
3. Right Hand Cam Handle No. 225
(Left Hand No. 226)

Similar device for Side-hinged Swing-in Casements consists of:
1. Auxiliary Latch No. 212
2. ½ in. Steel Tube
3. Cam Handle Right Hand No. 227
(Left Hand No. 228)

Triple Locking Device for use on Casements over 8 ft. 0 in. high is similar, with an additional auxiliary latch

Pull Down Ring No. 251
Used at top of Bottom-Projected-Out ventilators

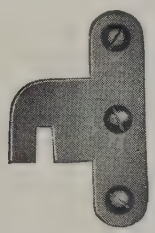
Spring Catch No. 243
Used at bottom of Bottom-Projected-Out ventilators beyond reach from floor



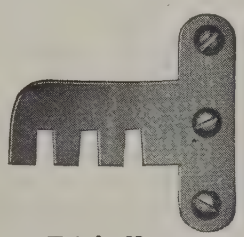
Wedge Plate No. 221
Used on side-hinged swing-out casements or vertically pivoted casements

Alternate Cam Handle
Right hand No. 210 shown—Left hand No. 211
When used in the double or triple locking device hardware numbers are as follows:
Swing-out, right hand No. 214—Left hand No. 215
Swing-in, right hand No. 216—Left hand No. 217

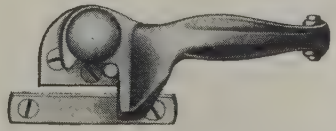
Cam Handle
Right hand No. 218 shown—Left hand No. 219
Used on side-hinged or vertically pivoted casements up to 4 ft. 0 in. high



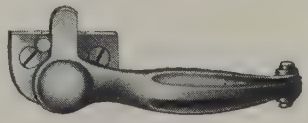
Single Keeper
Right hand No. 222 shown—Left hand No. 233
Used for cam handles on swing-in casements



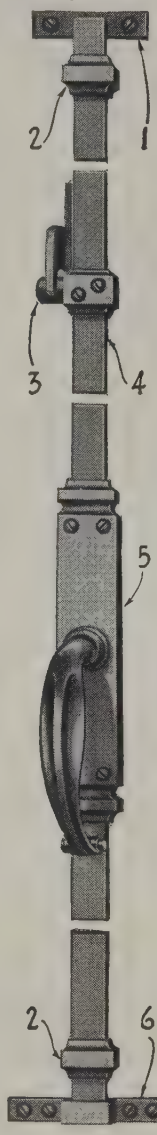
Triple Keeper
Right hand No. 223—Left hand No. 224
Used for cam handles on swing-in casements

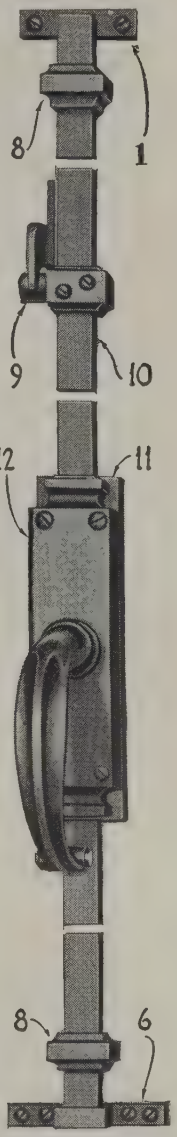


Cam Handle
Right hand No. 268 shown—Left hand No. 269
Used at bottom of Bottom-Projected-Out ventilators within reach from floor. One handle used for ventilators up to 3 ft. 6 in. wide. Two handles for wider ventilators



Cam Handle
Right hand No. 266 shown—Left hand No. 267
Used at top of Projected-In-at-Top ventilators within reach from floor. One handle used for ventilators up to 3 ft. 6 in. wide. Two handles used for wider ventilators





Cremone Bolts for Double Casements

BOLT FOR CASEMENTS UP TO 7 FT. 0 IN. HIGH
Consists of the following:
1. Keeper No. 291
Used at top and bottom of swing-out casements
Or
6. Keeper No. 285
Used at top and bottom of swing-in casements
2. Bar Guide No. 293
Spaced approx. 1 ft. 0 in. apart
3. Center Latch and Keeper
No. 286 above handle
No. 292 below handle
Spaced approx. 2 ft. 0 in. apart
4. Bronze Bar ½x¼ in.
5. Handle and Case No. 290
7. Pull Handle No. 237

BOLT FOR CASEMENTS OVER 7 FT. 0 IN. HIGH
Consists of the following:
1. Keeper No. 291
Used at top and bottom of swing-out casements
Or
6. Keeper No. 285
Used at top and bottom of swing-in casements
8. Bar Guide No. 340
Spaced approx. 1 ft. 0 in. apart
9. Center Latch and Keeper
No. 337 above handle
No. 338 below handle
Spaced approx. 2 ft. 0 in. apart
10. Bronze Bar ⅝x¼ in.
11. Malleable Iron Base Plate No. 146
12. Handle and Case No. 256
7. Pull Handle No. 237

Spring Catch No. 248
Used at top of Projected-In-at-Top ventilators beyond reach from floor

LUPTON STEEL WINDOWS FOR STANDARD SIZE OPENINGS

Combination Projected Casements—Projected-In-at-Top Casements
Architectural Projected Windows—Double Hung Windows

Applying advanced principles of standardization, approved by the Division of Simplified Practice of the United States Department of Commerce, we have designed four types of standardized Lupton Steel Windows interchangeable through a range of fifty sizes.

These windows permit unlimited architectural expression and are available at moderate cost for use in office buildings, hotels, apartment houses, hospitals and similar high-grade structures.

All projected types have a friction shoe controlling the movement of ventilators, which holds them at any reasonable degree of opening, and eliminates the use of sill hardware.

LUPTON PROJECTED CASEMENT WINDOWS

Lupton Combination Projected Casements

These windows, by their unique design, bring a new high standard of natural ventilation to multiple-story buildings. They are the only windows that afford such positive air control. A horizontal inward-opening ventilator located at the bottom of the window admits fresh air without draft.

Above, forming the upper portion of the window, are two side-projected ventilators. By closing one of these and slightly opening the other against the breeze, an air movement is induced which siphons used air out of the window.

Thus, Lupton Combination Casements provide easily controlled, balanced ventilation through every window opening.

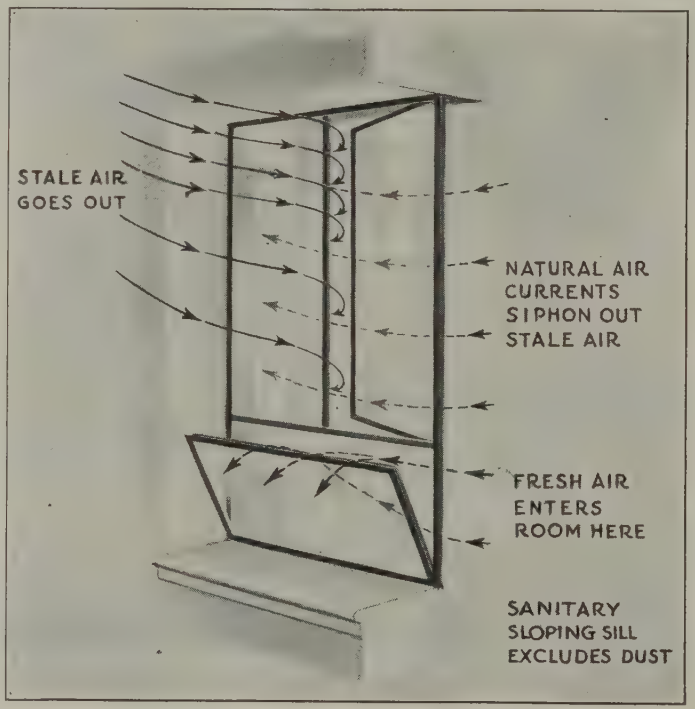

Diagram Showing How Lupton Combination Casements Assure Balanced Ventilation

Dotted arrows show natural fresh-air currents. Solid arrows show stale air moving outward by means of siphon action fully described in text

Lupton Single Casements—Details of these windows are the same as in the Lupton Combination Casements and have the same structural and 100% ventilation advantages. They offer an almost limitless number of arrangements and opening sizes when issued in any of the many combinations of which they are capable, both in the horizontal and vertical positions.

Lupton Projected-In-at-Top Casements

Maintenance of strict privacy, adequate ventilation without draft and abundant lighting are features of these windows.

They are particularly desirable for Medical Institutions, Art Museums, Hospitals, Solariums and similar buildings.

SPECIFICATION FOR LUPTON PROJECTED CASEMENT WINDOWS

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Projected Casement Windows, manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Projected Casement Windows should be accurately listed and located either in schedules, on plans or in specifications.

Shop Drawings

2. Submit in triplicate, for the architect's approval, complete shop and installation drawings. These shall show scaled sections of window and frame members, details of construction, hardware, anchoring, etc.

Materials

3. Ventilator and frame members shall be made of copper-bearing, rust-resisting, low-carbon steel, specially rolled in solid, one-piece sections.

4. Vertical Mullions shall be of 12 gauge plate, formed.

5. Imposts shall be of ⅜ in. thick, steel plate, with a 14 gauge galvanized weathering member.

6. Glazing Clips shall be $\frac{5}{16}$ in. by ½ in. rolled steel angles, 2 in. long.

Note: See List of Extras at end of specification.

Construction

7. All Projected Casements shall be designed for outside glazing.

8. All Projected Casement Windows shall be straight and true, members in alignment and surfaces in a plane. All joints shall be welded rigid and tight and so fabricated at the junctures or intersections as to prevent loss of strength.

9. Three sides of the ventilator shall be made of bars weighing not less than 1.7 lbs. per ft. and the remaining side of a bar weighing not less than 1.82 lbs. per ft. Frames shall be made of bars weighing not less than 2.14 lbs. per ft.

10. At the corners and joints of the frames and ventilators the members shall be mitered or notched framed together and heavily welded so as to make a rigid, tight connection.

Exposed, welded surfaces shall be ground smooth. The frame and ventilator shall form a two-point, flat, continuous, weathering contact.

11. Mullions and bolts for attachment shall be provided when two or more windows are placed side by side.

12. Imposts and bolts for attachment shall be provided when two or more windows are placed one above the other.

13. At the head of all Side Projected Out Ventilators a 16 gauge formed steel, hot galvanized, weather bar shall be used.

Continued on next page

14. Fins of 12 gauge steel for Head and Jambs shall be furnished, shipped unattached and applied in the field.

Note: See List of Extras at end of specification.

15. Anchor Clips of 14 gauge steel for Head, Jambs and Sill shall be furnished and applied in field.

16. Glazing Clips shall be held in place by steel machine screws.

Note: See List of Extras at end of specification.

17. Ventilators shall be accurately pivoted on two ventilator arms of solid steel. The two ventilator arms shall be attached to the ventilator and frame members by malleable iron arm blocks with brass pivot pins and washers. Ventilators shall be equipped with two bronze friction shoes, sliding in the outside frame member so as to guide the ventilator and prevent rattling. The friction shoes shall be equipped with a rustproof steel spring and adjusting screw, so designed to insure constant friction and hold the ventilator in an open position without the use of fasteners or adjusters.

Hardware

18. All Handles and Latches and Pull Down Rings shall be solid bronze with natural bronze finish. All hardware (listed below) shall be fitted in the shop and shipped unattached, carefully packed to prevent damage until applied for use.

Note: The following hardware is standard:

For Side-Projected-Out Ventilators

Bronze Cam Handle—for ventilators in windows less than 4 ft. 6 in. in height.

Double Locking Device—for ventilators in windows 4 ft. 6 in. or more in height.

For Projected-In-at-Top Ventilators

Bronze Cam Handle—for ventilators within reach from floor, one handle on windows up to 3 ft. 6 in. wide; two handles on windows over 3 ft. 6 in. wide.

Bronze Ring Type Cam Handle—for ventilators beyond reach from floor.

For Bottom-Projected-Out Ventilators

Pull Down Ring and Ring Type Cam Handle for pole operation.

Calking Cement

19. The window manufacturer shall furnish non-staining elastic calking cement and wooden filler-strips for mullions and imposts as shown in window manufacturer's standard details.

Note: See List of Extras at end of specification.

Erection

20. All Projected Casement Windows shall be erected in prepared openings by the window contractor (unless otherwise specified).

21. All Projected Casement Windows shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and Imposts (and continuous fins if specified) shall be bolted securely to windows. Calking cement and wooden filler-strips shall be neatly applied at mullions and imposts as shown on window manufacturer's standard details.

Note: See List of Extras at end of specification.

Note: Include in the masonry specifications that all masonry openings shall be accurately constructed in accordance with the installation details for Projected Casement Windows. Note that when the continuous fins are built in the masonry, the placing of the furring tile at the Jambs must be delayed until after the windows are set. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Painting

22. All Projected Casement Windows shall receive one coat of manufacturers' standard dark gray paint, oven-dried.

Note: The following should be provided for in the paint specifications: One additional coat of paint should be applied after erection, before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied, as required. It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the windows in order that it may not be painted over and cause imperfect contact.

Glass and Glazing

Note: Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel casement putty (ordinary wood sash putty must not be used).

(c) Specify that all Steel Projected Casements shall be glazed from the outside; that all glass shall be set in a bed of putty and secured by angle glazing clips; and that putty shall be applied in a neat, clean manner.

See List of Extras below.

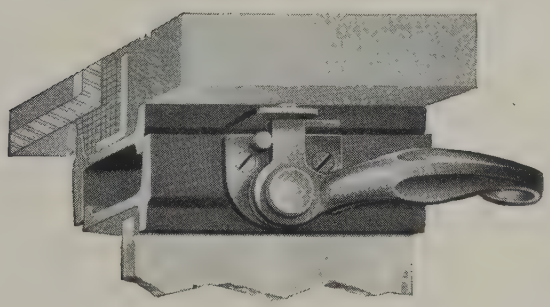
LIST OF EXTRAS

The following are furnished when specified at an added cost.

1. Continuous 12 gauge steel fins for head and jambs.
2. Non-staining elastic calking cement.
3. Application of calking cement at time of erection as shown on our standard details.
4. Continuous Glazing Angles to be substituted for Glazing clips. These glazing angles are made of hot rolled steel angle section $\frac{7}{8} \times \frac{29}{32} \times \frac{3}{32}$ in. They are cut in standard lengths with mitered ends, shipped loose and attached by the glazing contractor with the round head, udylited, steel machine screws supplied for the purpose.

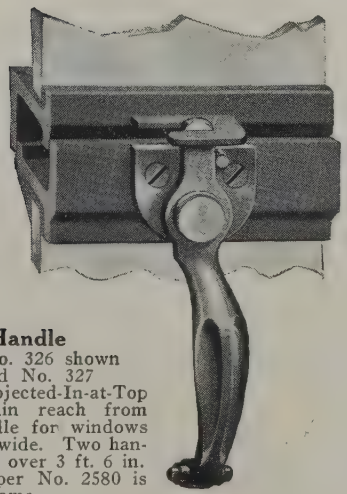
HARDWARE FOR LUPTON PROJECTED CASEMENT WINDOWS

All Handles and Latches Are Solid Bronze with Natural Bronze Finish



Ring Type Cam Handle No. 330

Used at center of Projected-In-at-Top Ventilators beyond reach from floor. For pole operation. Steel Keeper No. 2580 is welded to the frame



Cam Handle

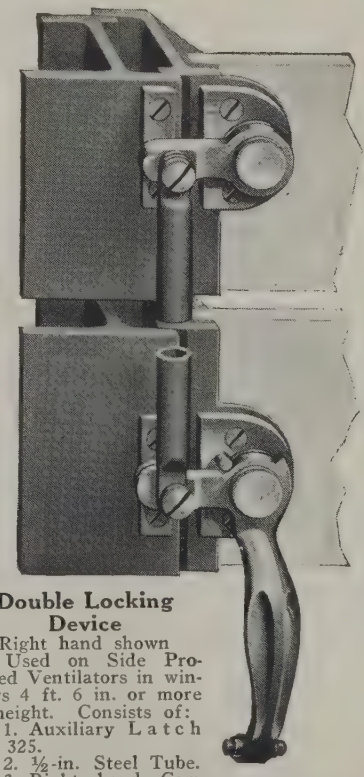
Right hand No. 326 shown —Left hand No. 327

Used on Projected-In-at-Top Ventilators within reach from floor. One handle for windows up to 3 ft. 6 in. wide. Two handles for windows over 3 ft. 6 in. wide. Steel keeper No. 2580 is welded to the frame

Cam Handle

Right hand No. 315 shown —Left hand No. 316

Used on Side Projected Ventilators in windows less than 4 ft. 6 in. in height. Mounted on Steel Backing Plate No. 2228 welded to frame of ventilator



Double Locking Device

Right hand shown

Used on Side Projected Ventilators in windows 4 ft. 6 in. or more in height. Consists of:

1. Auxiliary Latch No. 325.
2. ½-in. Steel Tube.
3. Right hand Cam handle No. 322—Left hand No. 323. Both Auxiliary Latch and Cam Handle are mounted on Steel Backing Plates No. 2228 welded to frame of ventilator

LUPTON ARCHITECTURAL PROJECTED WINDOWS

(Outside Glazed)

Some buildings, or parts of buildings, because of limits in cost or because of other restrictions will not permit the use of the windows previously described. In such cases, Lupton Architectural Projected Windows, made of lighter sections, will often fill the requirements of good ventilation and lighting with entire satisfaction.

SPECIFICATION FOR LUPTON ARCHITECTURAL PROJECTED WINDOWS

(Outside Glazed)

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Architectural Projected Windows (outside putty glazed), manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Architectural Projected Windows should be accurately listed and located either in schedules on plans or in specifications. If more than one type of window be desired, each type should be separately listed and located, or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate, for the architect's approval, complete shop and installation drawings. These shall show scaled sections of window and frame members, details of construction, hardware, anchoring, etc.

Materials

3. Frame members shall be heavy, specially designed, solid steel channel section.

4. Ventilator members shall be specially designed, solid steel angle sections.

5. Muntins shall be specially designed, solid steel cruciform section 1⅜ in. deep.

6. Vertical mullions shall be specially designed solid steel H section.

Note: Structural steel members forming Imposts are not furnished by the window manufacturer.

Construction

7. All Architectural Projected Windows shall be designed for outside glazing.

8. Both Frames and Ventilators shall be assembled by tenoned, riveted and welded joints at the corners. Continuous, two-point, flat contact weathering shall be provided between ventilators and frames.

9. Muntin Bars shall be attached to frame members by tenoned, riveted joints and shall be so interlocked at their intersections that the strength and rigidity at the intersection is increased.

10. Vertical Mullions and bolts for attachment shall be provided when two or more windows are placed side by side.

11. Fins of 12 gauge steel for head and 14 gauge steel for jamb shall be furnished and attached in factory.

12. Anchor Clips of 14 gauge steel for jamb, sill and head shall be furnished and applied in field.

13. Each ventilator shall be accurately pivoted on two ventilator arms of solid steel. The connections between the ventilator arms and the window frames shall be made by steel arm blocks.

14. Each ventilator shall be equipped with two brass friction shoes, sliding vertically in the ventilator jambs to guide the ventilator and prevent rattling. Each shoe shall be equipped with a rustproofed, flat steel spring attached to the ventilator to insure constant pressure at the jambs.

15. Universal Clip shall be an angle clip 1⅝"x1"x2" long riveted to the ventilator frame to provide for attaching cam handle.

Hardware

16. All handles shall be bronze with natural bronzed finish.

17. All bronze hardware (listed below) shall be shipped unattached, carefully packed to prevent damage until applied for use.

Note: The following hardware is standard:

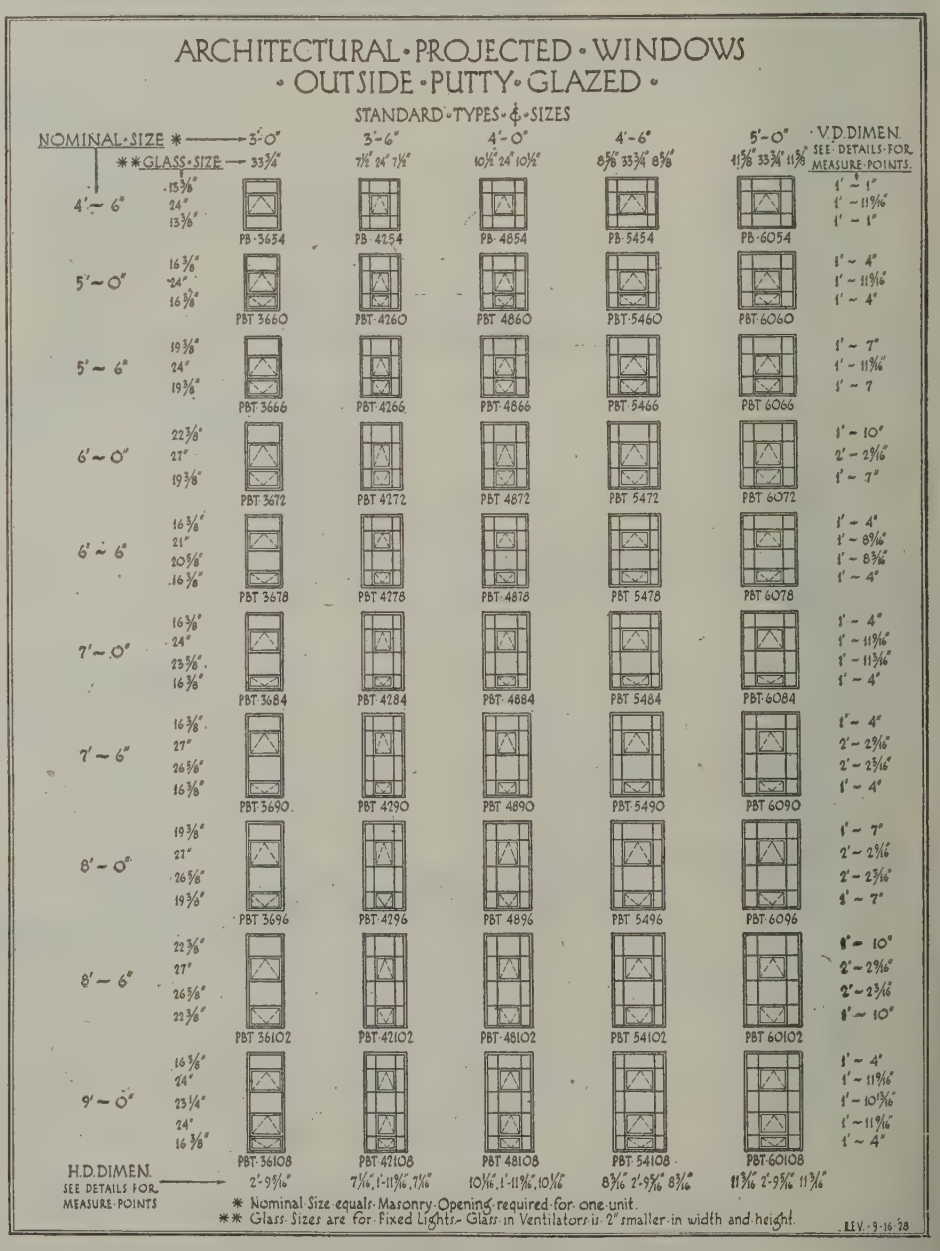
For Bottom-Projected-Out Ventilators

Bronze Cam Handle—when handle is within reach from floor.

Bronze Ring Type Cam Handle and Bronze Pull Down Ring—when handle is beyond reach from floor.

For Projected-In-at-Top Ventilators

Bronze Cam Handle.



Standard sizes reduce costs of windows, lintels, sills, shades, awnings and screens

Continued on next page

Calking Cement

18. The window manufacturer shall furnish non-staining elastic calking cement for mullions as shown in window manufacturer's standard details.

Note: See note at end of specification.

Erection

19. All Architectural Projected Windows (outside glazed) shall be erected in prepared openings by the window contractor unless otherwise specified.

20. All Architectural Projected Windows (outside glazed) shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions shall be bolted securely to Frames. Calking cement shall be neatly applied at mullions as shown on window manufacturer's standard details.

Note: See note at end of specification.

Note: Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Architectural Projected Windows (outside glazed). Note that when the continuous fins are built in the masonry, the placing of the furring tile at the Jambs must be delayed until after the windows are set. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

Painting

21. All Architectural Projected Windows shall receive one shop coat of window manufacturer's standard dark gray paint, oven-dried.

Note: The following should be provided for in the paint specification: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required. It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the windows in order that it may not be painted over and cause imperfect contact.

Glass and Glazing

Note: Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify a high-grade steel window putty (ordinary wood sash putty must not be used.)

(c) Specify that Lupton Architectural Projected Windows shall be glazed from the outside; that the glass shall be set in a bed of putty and secured by Lupton standard glazing wedges; and that the putty shall be applied in a neat clean manner.

NOTE

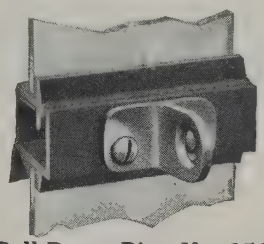
Calking furnished at added cost.

1. When specified non-staining elastic calking cement will be furnished for calking.

2. Erectors will apply this calking cement at time of erection at the points indicated in the standard details, only when such application is specified.

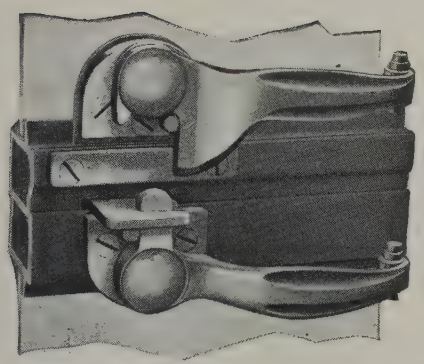
HARDWARE FOR LUPTON ARCHITECTURAL PROJECTED WINDOWS

Handles and Pull-down Rings Are Bronze with Natural Bronze Finish



Pull-Down Ring No. 251

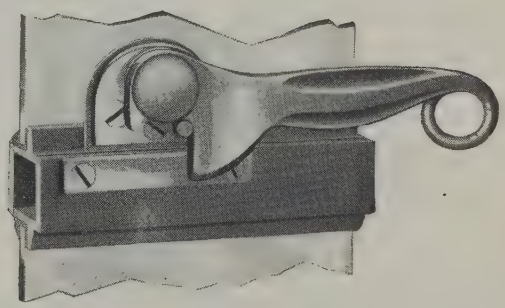
Used on Bottom-Projected-Out ventilators. For pole operation



Cam Handle No. 268

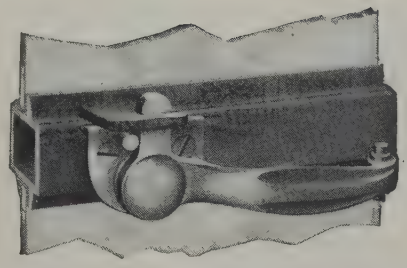
(at top)

Used on Bottom-Projected-Out ventilators within reach from floor. Mounted on Universal Clip riveted to frame of ventilator. Lever handle No. 266 shown in combination with No. 268 and illustrates its application at meeting rail condition



Ring Type Cam Handle No. 328

Used at center of Bottom-Projected-Out ventilators beyond reach from floor. For pole operation, mounted on universal clip riveted to frame of ventilator



Right Hand Cam Handle No. 266

Used on Projected-In-at-Top ventilators. Steel keeper welded to frame

LUPTON DOUBLE HUNG WINDOWS

These windows are so designed as to permit the sash to slide up and down easily and at the same time to prevent excessive air infiltration. The frames and sash are made of zinc-coated steel plate. They are furnished with or without muntins. Standard practice includes weather-stripping at jambs but we furnish, at extra cost, additional weather-stripping at head, sill and meeting rail when it is so specified. There are two types, E and F, each in fifty sizes.

Windows without muntins are standard. With muntins arranged as shown on page 30 the window is a "listed special." Muntins arranged any other way make the window special.

SPECIFICATION FOR LUPTON DOUBLE HUNG WINDOWS (Types E and F)

Work Included

1. Furnish and install where shown on drawings, Lupton Steel Double Hung Windows manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Double Hung Windows should be accurately listed and located either in schedules on plans or in specifications. If more than one type of window, or more than one type of hardware be desired, each type should be separately listed and located or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate, for the architect's approval, complete shop and installation drawings. These shall show scaled sections of window and frame members, details of construction, hardware, anchoring, etc.

Materials

3. Sash members shall be of 14 gauge on windows up to 4 ft. 0 in. wide, and 12 gauge on windows over 4 ft. 0 in. wide. Glazing strips shall be 14 gauge for all rails except bottom rail. The glazing strip for the bottom rail shall be 12 gauge. All sash members shall be cold galvanized strip steel.

4. Frame members (E Type)—Head, head cover, jamb box and removable jamb piece shall be made of 20 gauge and the sill of 16 gauge. All frame members shall be hot galvanized, dull-coated steel sheets.

5. Frame members (F Type)—The head shall be made of 16 gauge, the head cover of 16 gauge, the sill of 12 gauge, the jamb box proper of 14 gauge and the removable jamb piece of 16 gauge. All frame members shall be hot galvanized, dull-coated steel sheets.

6. Parting Strips shall be made of 16 gauge cold galvanized strip steel.

7. Muntin Bars shall be made of 16 gauge cold galvanized strip steel.

8. Muntin Glazing Strips shall be made of 14 gauge cold galvanized strip steel.

Construction

9. Sash members shall be designed with flanges to enter groove in head and jamb boxes. The bottom rail of the lower sash shall form a double contact with the sill member. The meeting rail shall interlock. The sash members shall be mitered and arc welded at all corners.

10. Frame members—The head (exclusive of cover) and sill shall each be made of one piece of steel. The jamb box shall consist of three parts: (1) the box proper, (2) a removable piece for access to weights, (3) a parting strip. The removable piece and the parting strip shall each be in two sections with the joint at the level of the meeting rail. The sash weights shall be separated by a division strip. The frame members shall be coped to fit each other at corners and arc welded.

11. Muntin bars shall be spotwelded to sash members.

12. Muntin Glazing Strips are attached to muntins with low round-head machine screws.

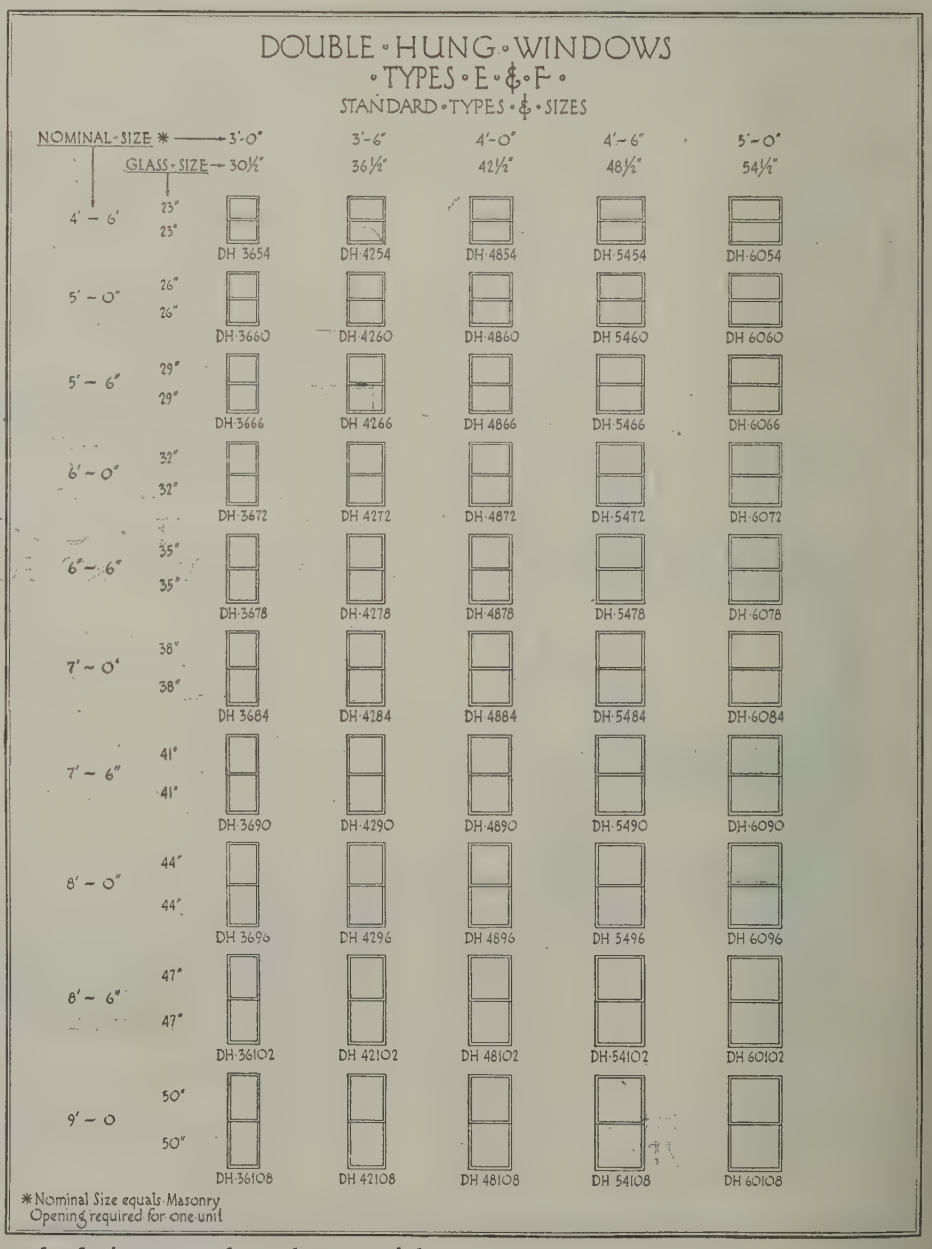
13. Weather Stripping of 22 gauge steel, galvanized, shall be furnished for the jambs.

Note: Additional spring bronze weathering at head, meeting rail and sill, is furnished when specified at slight added cost.

Attached Hardware

14. Each window shall be equipped with two pulleys machined from cold-rolled steel. The pulleys shall have oilless bearings and shall be set in a 12 gauge steel pulley pan. The sash chain shall be American Chain Co. No. 130 Galvanized Sash Chain.

15. The Glazing Strip for the bottom rail of the lower sash shall act as a continuous lift.



Standard sizes cost less than specials

Continued on next page

Unattached Hardware

16. The following hardware shall be shipped unattached and carefully packed to prevent damage until applied for use.

17. Meeting Rail Locks shall have cam action and shall be malleable iron with cold galvanized Lupton No. 70 finish.

18. Pull-Down Handle shall be malleable iron, cold galvanized Lupton No. 70 finish, for attaching to lower rail of top sash.

19. Pull-Down Socket shall be malleable iron, cold galvanized Lupton No. 70 finish, for attaching to upper rail of top sash for pole operation.

Calking

Note: Calking is not done by Lupton, but, when specified, non-staining elastic calking cement is furnished by Lupton at added cost.

Erection

Note: Lupton Double Hung Windows (Types E and F) are shipped assembled with the sash raised and wired to the head. The chain is wired tight inside the jamb box, and the sash weights are shipped unattached.

20. All Lupton Double Hung Windows shall be erected in prepared openings by the window contractor, unless otherwise specified. They shall be set plumb and true, securely fastened in place and properly adjusted before glazing.

Note: Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Double Hung Windows, and that all mortar, grouting, pointing, etc., shall be done by the mason contractor after windows have been erected.

Painting

21. All windows shall receive one coat of window manufacturers standard gray galvanized metal primer in the factory.

Note: The following should be provided in the paint specifications: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied.

Glass and Glazing

Note: Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that all Lupton Steel Double Hung Windows shall be glazed from the inside; that all glass shall be set in a bed of putty and secured by 14 gauge glazing strips which in turn are secured by low round-head machine screws; and that the putty shall be finished in a neat, clean manner.

REQUIREMENTS FOR UNDERWRITERS' LABELS

1. Both Types E and F Windows may be labeled.

2. Maximum size of unit is 6 ft. 0 in. wide and 10 ft. 0 in. high.

3. Multiple unit openings require mullions anchored at head and sill.

4. The maximum exposed glass area is 720 sq. in., with a maximum horizontal dimension of 48 in. and a maximum vertical dimension of 54 in.

5. Sash locks must be malleable iron.

6. Weather-stripping at head, meeting rail, and sill is optional.

LUPTON RESIDENCE CASEMENTS
of Copper-Bearing Steel

Designed for all types of residences, apartment houses and similar buildings, Lupton Residence Casements possess many superior features in design and construction.

New type malleable iron friction hinges are furnished as standard but upon special request we will furnish non-friction hinges and sill hardware at extra cost.

SPECIFICATION FOR LUPTON RESIDENCE CASEMENTS OF COPPER-BEARING STEEL

Work Included

1. Furnish where shown on drawings, Lupton Residence Casements of copper-bearing steel as manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Residence Casements should be accurately listed and located either in schedules on plans, or in specifications. If more than one type of Residence Casement or more than one type of hardware be desired, each type should be separately listed and located or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show scaled sections of frame members, hardware, anchoring, etc.

Materials

3. Ventilator and frame members shall be made of specially rolled, copper-bearing, rust-resisting, steel sections.

4. Muntins shall be specially designed, copper-bearing, rust-resisting, steel T bar sections.

5. Mullions shall be 14 gauge steel plate, formed.

6. Imposts shall be 12 gauge steel plate, formed.

Construction

7. All casements shall be designed for outside glazing.

8. All casements shall be straight and true with members in alignment and surfaces in a plane.

9. Ventilator and frame members shall be mitered at corners and butt welded. The frame and ventilator shall form a two-point, flat, continuous, weathering contact.

10. Muntin Bars shall be continuous from top to bottom, and from side to side between frame members or ventilator members. They shall be attached to frame members or ventilator members by tenoned, riveted joints and shall be so interlocked at their intersections as not to decrease their ultimate strength.

11. Mullions and bolts for attachment shall be provided whenever two or more units are placed side by side in an opening.

12. Imposts and bolts for attachment shall be provided whenever two or more units are placed one directly above the other in an opening.

13. Weather bars of 16 gauge hot galvanized steel plate shall be furnished for ventilators that extend to the head.

Note: (a) Continuous anchors should be specified here if wanted. See List of Extras at end of specification.

(b) Sill and jamb anchor clips of steel should be specified here if wanted.

Hardware

14. All hardware, except hinges, shall be shipped unattached; carefully packed to prevent damage. Top-hinged ventilators shall be equipped with close-up friction hinges and shall have malleable iron transom latches supplied for locking. Side-hinged ventilators shall be equipped with extended friction hinges and shall have malleable iron handles supplied for locking.

Note: If non-friction hinges under screen operators, or alternate hardware is desired, the above specification should be changed accordingly. See List of Extras at end of specification.

Solid bronze handles illustrated on page 10 are furnished at added cost when specified. When specified and at added cost ventilators will be equipped with non-friction hinges and adjusters.

Calking Cement

15. The window manufacturer shall furnish non-staining elastic calking cement in quantities sufficient for application as shown on window manufacturer's standard details.

Erection

16. All casements shall be erected by (state by whom). They shall be set plumb and true, properly aligned and securely anchored before glazing. Mullions and imposts (and continuous anchors if specified) shall be bolted securely to frames. A 16-gauge weather bar shall be placed over ventilators extending to the head. Calking cement shall be neatly applied at points indicated on window manufacturer's standard details.

Note: Malleable iron hardware should be attached before painting. Bronze hardware should be attached after plastering and painting are finished.

Painting

17. All casements shall receive one shop coat of casement manufacturer's standard dark gray paint, oven dried.

Note: (a) The following should be provided for in the paint specifications: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied.

(b) It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the ventilators and frames, in order that it may not be painted over and cause imperfect contact.

Glass and Glazing

Note: Specify glass and glazing under proper heading elsewhere in general specifications of other trades.

(a) Do not specify single thickness glass.

(b) Specify a high grade steel casement putty (ordinary wood sash putty must not be used).

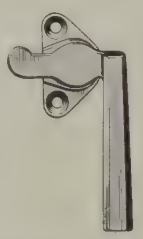
(c) Specify that all residence casements shall be glazed from the outside and that all glass shall be set in a bed of putty and secured by the Lupton standard wire glazing clips.

LIST OF EXTRAS

The following are alternates and extras furnished when specified at added cost.

1. Weather bars of 16 gauge hot galvanized steel plate used over ventilators extending to the head.
2. Continuous anchors of 16 gauge galvanized steel with corner fillers of 18 gauge galvanized steel for use at head and jamb.
3. Under screen operator. (Used with non-friction hinges.)
4. Bronze handles and bronze transom latch.

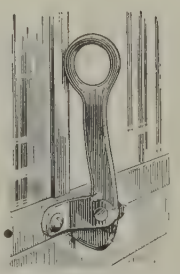
HARDWARE



Standard Handle

Right hand No. 134 shown —Left hand No. 135

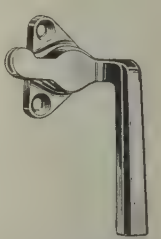
This handle made of malleable iron is the one regularly furnished on all side-hinged ventilators



Transom Latch for Top-hinged Ventilators

Malleable iron latch No. 348 is standard and is furnished on all top-hinged ventilators.

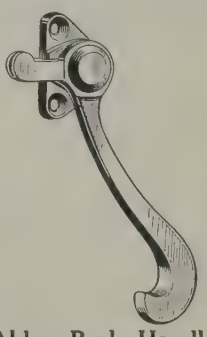
Bronze latch No. 349 of similar design can be furnished as an alternate when specified



Bronze Handle

Right hand No. 234 shown —Left hand No. 235

This bronze handle is similar in design to the No. 134 handle and can be furnished as an alternate when specified



Alden Park Handle

Right hand No. 270 shown— Left hand No. 271

This bronze handle is an alternate furnished only when specified

Sheraton Handle

Right hand No. 272 shown— Left hand No. 273

This bronze handle is an alternate furnished only when specified

Lupton Basement Windows

Lupton Basement windows are made of the same copper bearing rust resisting sections as Lupton Residence Casements. The members are mitered at the corners and solidly welded. The bottom rail of the ventilator is specially shaped to form a weathertight drip. Ventilators are easily removed by taking out the split pin in the hinge.

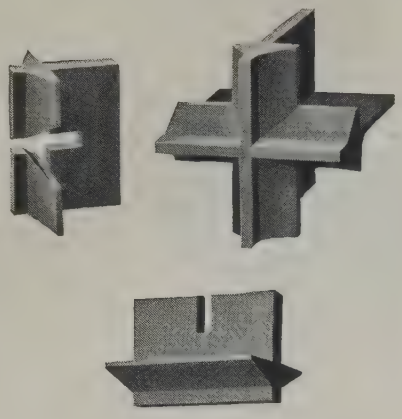
LUPTON STEEL PIVOTED WINDOWS

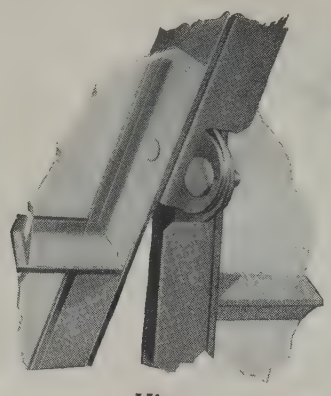
For Sidewalls of Industrial Buildings

Usually less expensive than corresponding areas of masonry wall, Lupton Pivoted Windows offer a satisfactory method of natural ventilating and daylighting of industrial buildings.

Types, sizes and designs presented in the following pages represent the standard practices of the steel window industry relative to this product. The sizes and ventilator arrangements listed are those which have been found to fill all of the ordinary requirements of building construction. Departures from standard practice should be avoided as they increase the cost and delay shipment.



Muntin Joint



Hinge

Two Points of Superiority of Lupton Pivoted Windows:

1. The design of the Lupton interlocking muntin joint combines most effective placing of metal with the least possible deformation. The greater the external pressure, the tighter is the lock of the intersecting members. This joint gives less opportunity for moisture to enter and cause corrosion.

2. The Lupton Hinge is integral with the weathering members, and is reinforced with steel plates riveted to the weathering members. There are no spacers, hence the hinge pins cannot sag.

SPECIFICATION FOR LUPTON STEEL PIVOTED WINDOWS

Work Included

1. Furnish where shown on drawings Lupton Steel Pivoted Windows, manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Lupton Pivoted Windows should be accurately listed and located either in schedules on plans or in specification. If more than one type of window, or more than one type of hardware be desired each type should be separately listed and located, or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop and installation drawings. These shall show scaled sections of windows and frame members, details of construction, hardware, anchoring, etc.

Materials

3. Sections shall be specially designed, hot-rolled, solid steel.

4. Frame members shall be angle sections, Lupton Standard shape.

5. Muntins shall be special cruciform section 1⅜" deep.

6. Vertical Mullions shall be hot-rolled, solid T-Bar section.

Note: Structural Steel Members forming Imposts are not furnished by the window manufacturer.

Construction

7. All Steel Pivoted Windows shall be designed for inside glazing.

8. Both Frames and Ventilators shall be assembled by tenoned, riveted joints at the corners. Continuous, two-point, flat contact weathering shall be provided between Ventilators and Frames.

9. Muntin Bars shall be continuous from top to bottom, and from side to side, between frame members or ventilator members. They shall be attached to frame members or ventilator members by tenoned, riveted joints and shall be so interlocked as not to decrease their ultimate strength at the intersection.

10. Vertical Mullions shall be provided with bolts for frame attachment where two or more windows are placed side by side in the same opening.

11. Structural Steel Clips shall be furnished to attach window to steel structure in types and lengths to cover all possible conditions.

12. Sill Anchor Clips shall be furnished. At least one clip shall be used for each two lights in the width of a unit.

13. All Ventilators shall be horizontally pivoted. Ventilator pivot shall be integral with weathering to insure permanent alignment. The pivot shall be located 2" above center. Ventilators shall be held in place at the pivots with 5/16" flat-head iron rivets and shall operate freely and easily.

Note: Pivot may be located at a different point if so specified. The window then becomes "special."

14. Universal Clips—An angle clip 1 5/16"x1"x2" long, shall be riveted to the ventilator frame.

Note: The Universal Clip allows any type of Lupton Pivoted Window hardware to be attached to the ventilator before or after glazing.

Hardware

15. All hardware (listed below) shall be shipped unattached, carefully packed to prevent damage until applied for use.

16. Provide steel clip to hold either stay bar or spring catch chain.

17. Provide steel stay bar where Ventilators are within reach from floor.

18. Provide steel spring catch, chain and chain roller guide where Ventilators are beyond reach from floor.

Mechanical Operators

Note: Mechanical operators are covered in a separate specification.

Erection

19. All Steel Pivoted Windows shall be erected by (state by whom), in prepared openings, unless otherwise specified.

Note: Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Steel Pivoted Windows. All grouting, pointing, etc., should be done by the mason contractor after the windows are set.

20. Lupton Steel Pivoted Windows shall be set plumb and true, properly aligned and securely anchored before glazing. All Ventilators shall be properly adjusted before glazing.

21. All hardware shall be applied under window manufacturer's directions.

Painting

22. All windows shall receive one shop coat of window manufacturer's standard, dark gray paint, oven-dried.

Note: The following should be provided for in the paint specification: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required. It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the windows in order that it may not be painted over and cause imperfect contact.

Glass and Glazing

23. Furnish standard wire glazing clips, four to each light.

Note: Specify glass and glazing under proper heading elsewhere in specifications.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

(c) Specify that Lupton Steel Pivoted Windows shall be glazed from the inside; that the glass shall be set in a bed of putty and secured by Lupton standard wire glazing clips, four to each light; and that the putty shall be applied in a neat, clean manner.

Note: Do not paint until putty has set. See paragraph headed Painting.

Use standard sizes for quicker deliveries—lower costs

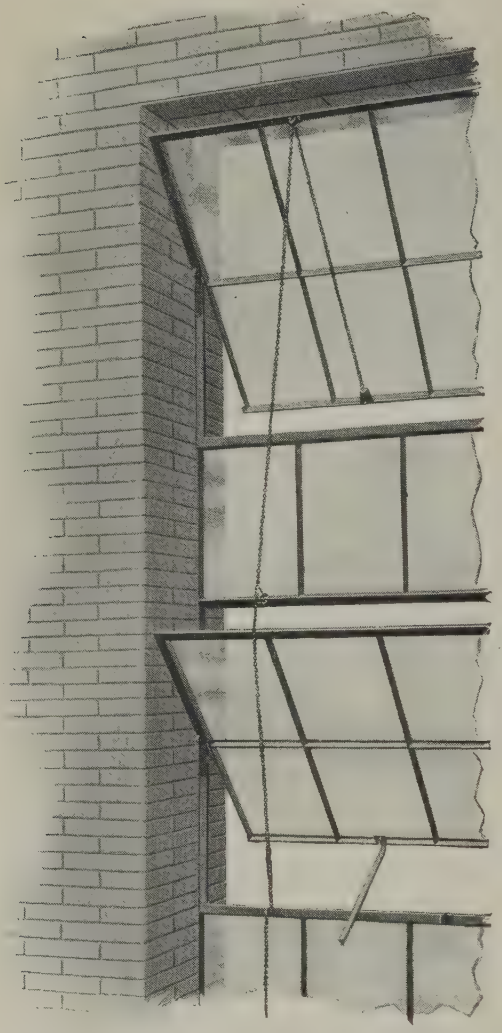
HARDWARE FOR LUPTON PIVOTED WINDOWS

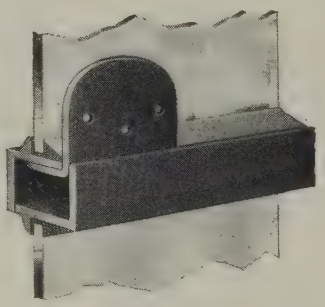


View Showing Two Ventilators in a Unit, One Above the Other

The lower ventilator is operated by Lupton Stay Bar, the upper by Spring Catch and Chain

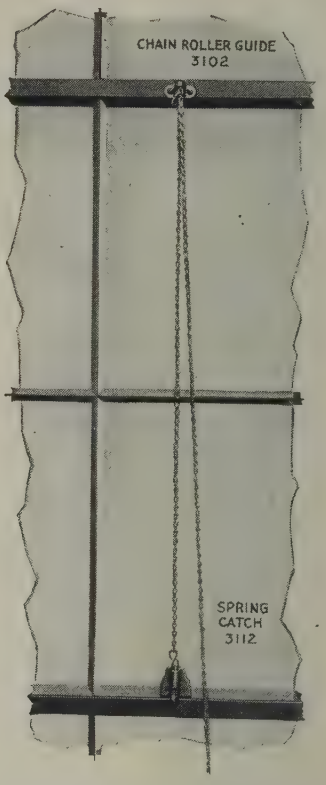
Clip No. 3018

Holds either Stay Bar or Chain



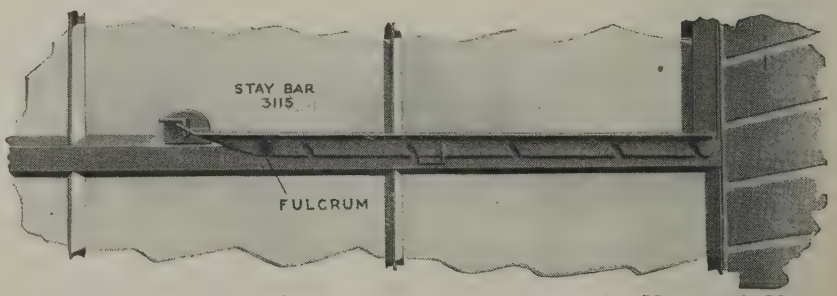
Universal Clip No. 3105

All Lupton Pivoted Windows are now equipped with the Universal Clip riveted to the ventilator. This clip permits the attaching of hardware after the windows are glazed



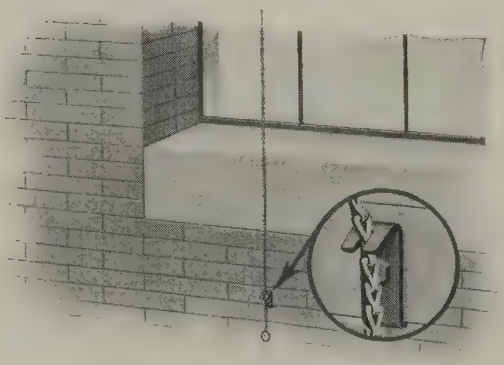
A Ventilator Operated by Lupton Spring Catch and Chain

View shows Chain Roller Guide attached to top member of ventilator and Spring Catch to bottom member. Spring Catch is mounted on the Universal Clip



Lupton Stay Bar in Closed Position Mounted on the Universal Clip

Near its attached end the Stay Bar is pressed out to form a fulcrum. The fulcrum causes the ventilator to be drawn up tightly against the frame and locked when the Stay Bar is inserted in the clip provided to hold it. Five notches are provided for holding the ventilator at various degrees of opening



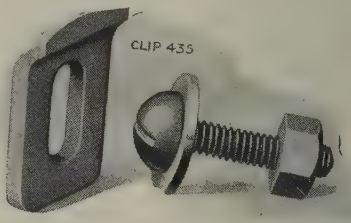
Wall Clip No. 2365

Used as alternate to Stay and Chain Holder No. 3018

Standard Lupton Wall Tie No. 2472

Used for anchoring windows at the sill in brick or concrete construction. It is shipped fastened flat against the frame of the window and is bent down at time of erection. It is approximately 4 in. long when bent.

Strap anchors for steel construction can be furnished in any length when conditions are known or length in flat is specified



Standard Lupton Clip No. 435

For attaching Section 308 to steel framing or to walls with anchor bolts

Continued on next page

Hardware

Where sill height is not specified, we supply Lupton Stay Bars with all single ventilators. A stay-bar is furnished with the lower ventilator of a unit having two ventilators. A Spring Catch and 12 ft. of Chain are furnished for the upper ventilator. Where sill height is specified we furnish Spring Catch and Chain operation only for ventilators whose bottom edges are more than 6 ft. above the floor. In this case or when specified a special clip No. 2365 is furnished to fasten the chain to the wall below the window. If for any reason Stay Bars are wanted on high windows or Spring Catches and Chains on low windows, that fact must be noted in the order. See illustrations, page 39.

Window Cleaners' Anchors: Where window cleaners' anchors are ordered, those made by the R. J. Dickey Window Cleaning Device Co., Columbus, Indiana, will be furnished, unless others are specified.

Ordering Standard Pivoted Windows

Standard and stock types and sizes are shown on page 41; details are shown on pages 44 and 45.

All windows departing in any particular from the sizes, types, details and specifications given here are special, require more time for delivery and cost more.

Underwriters' labeled windows in standard types and sizes are not special. See page 46 for Underwriter's requirements.

Orders for Dealer Stock Windows (shown shaded in diagram on page 41) can be filled immediately if we are given *complete* information.

Information required with order:

1. *Shipping date* desired (on non-stock sizes time must be allowed for assembling).

2. *Glass sizes.* (All Standard Windows including Dealer Stock are 12x18 in. and 14x20 in. glass sizes only.)

3. *Sizes of windows,* in number of lights wide and high. Always specify width (in number of lights) first. Use symbols given on page 41.

4. *Number of ventilators in each window,* also their size and location. Use symbols given on page 41.

5. *Number of window units in each opening.* This tells us how many mullions are required. See pages 41 and 42 for quick method of listing.

6. *Size of openings,* as a check on glass and window sizes. See table, page 43.

7. *Height of sill from floor.* This gives us the proper length of chains when chains are required, and tells us whether the lower ventilator should be operated by Chain or Stay Bar. See Hardware on page 39.

8. *Kind of wall fastenings required.* This depends on the construction of the walls—whether brick, concrete or steel; also on the method of attaching windows. It is necessary to give attachments in detail. To do this refer to page 44 and specify by the numbers in circles the details at head, jambs and sill which will be used.

Unless otherwise specified Wall Tie No. 2472 (shown on page 39) is furnished for anchoring at sill only.

The quantities of these wall fastenings supplied are as follows:

	For units 3 or 4 lights wide	For units 5 or 6 lights wide
At head	2 per unit	3 per unit
At sill	2 per unit	3 per unit

	For unit 1 light high	For unit 2, 3 or 4 lights high	For unit 5 or 6 lights high	For unit 7 lights high
At each jamb	1	2	3	4

When detail 79 is specified, and the steel contractor punches holes for No. 435 Clips, a clip is provided for each hole, otherwise clips are provided on approximately 2-ft. centers.

Special Windows

Although special windows are not recommended, it is sometimes necessary to use them. To order special windows use the same system of symbols as used for standard windows (explanation on page 41). Be sure to give the correct glass size as a check on the window dimension.

Window dimensions for Special Glass using angle frame member section 308 are figured as follows:

For single units, add 3/8 in. to the glass size (width or height as required) of each light. Multiply by the number of lights and add 7/8 in.

It is recommended that ventilators not exceeding four lights in width and two lights in height be used.

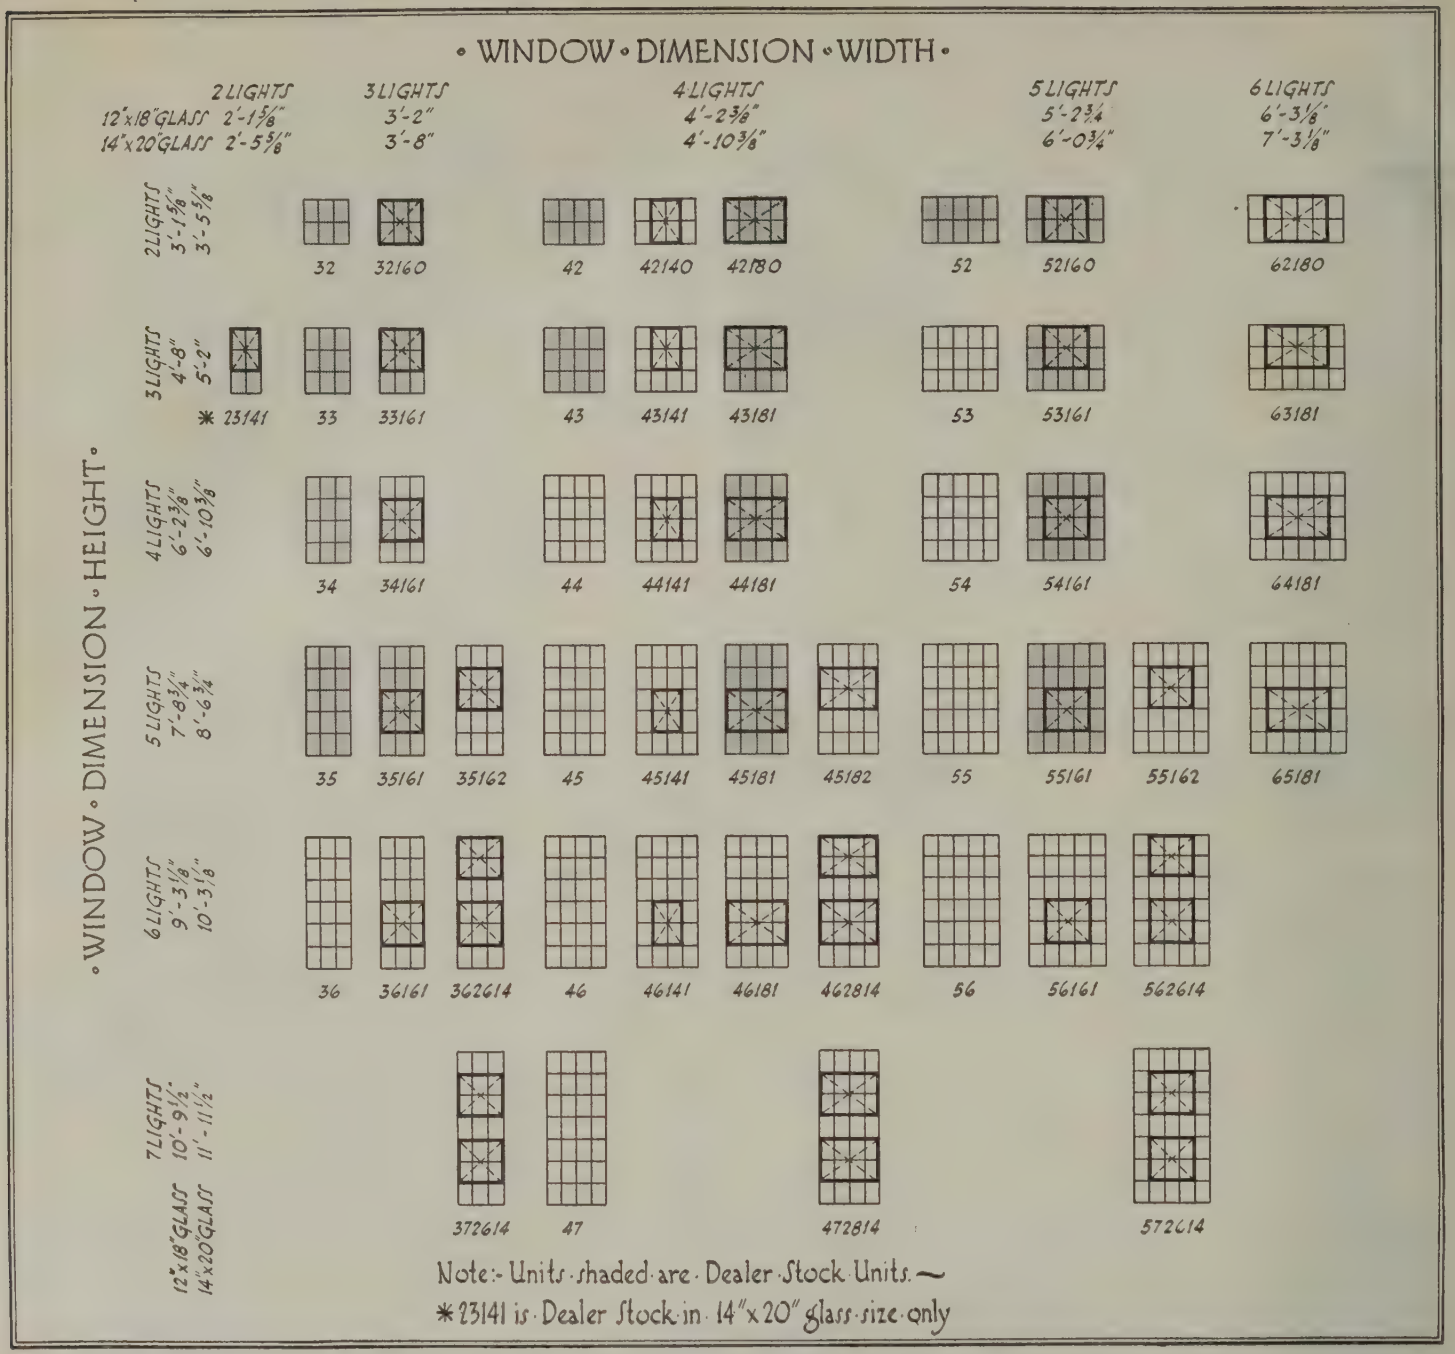
Single ventilators should not exceed 5 ft. 0 in. in width or 3 ft. 6 in. in height.

Use glass sizes for stationary lights when figuring opening sizes. Glass in border lights of ventilators is reduced 1 in. in height or width or both to allow for space taken by the weathering.

Erection

When Pivoted Windows are not erected by Lupton, the foreman in charge of erection should be thoroughly familiar with the correct method of installation. A booklet giving necessary erection data is furnished free.

Continued on next page



Standard Types and Sizes Lupton Pivoted Windows
Units shaded are dealer stock

Dealer Stock Windows

Dealer Stock Windows are the most used sizes of Lupton stationary and pivoted windows in 12 in. x 18 in. and 14 in. x 20 in. glass sizes. They are strictly standard in construction and are carried completely assembled and ready for shipment by Lupton sales representatives throughout the country.

Lupton Dealer Stock Windows should always be used where possible in preference to Standard, but non-stock sizes. They cost no more and can be delivered immediately from factory or warehouses.

Lupton Standard Windows include all those sizes and ventilator arrangements in common use. They are not assembled in advance nor kept in stock in warehouses, but large stocks of the cut bars are always carried in our factory ready for quick assembly.

Explanation of Symbol Numbers

The following information is given you so that you can intelligently order Lupton Pivoted Windows by following layouts shown on this and the next page.

Numerals of nomenclature indicate the following:
First numeral—number of lights wide.
Second numeral—number of lights high.
Third numeral—number of ventilators.
Fourth numeral—number of lights per ventilator.
Fifth numeral—number of stationary lights high between bottom of window and bottom of ventilator.
Sixth numeral—number of lights high between bottom or window and bottom of upper ventilator.

Use of Symbol Numbers in Ordering

The symbol number must always be preceded by the glass size. Standard glass sizes are 12 in. x 18 in. and 14 in. x 20 in. All others are special.

In addition to the glass size and the symbol required, the number of mullions, if any are required, must be indicated.

Examples: 14 in. x 20 in.—56 indicates a unit taking 14 in. x 20. in glass, 5 lights and 6 lights high stationary.

14 in. x 20 in.—45181 indicates a unit taking 14 in. x 20 in. glass, 4 lights wide and 5 lights high, having one 8 light ventilator with one light between the bottom of the ventilator and the sill.

12 in. x 18 in.—562614 indicates a unit taking 12 in. x 18 in. glass, 5 lights wide, 6 lights high, 2 six light ventilators, the lower ventilator one light above the sill and the upper ventilator 4 lights above the sill.

Units for multiple openings are ordered thus: 2 openings 3—12x18—46181 means that for each of 2 openings there is

For quick deliveries, use standard sizes

Continued on next page

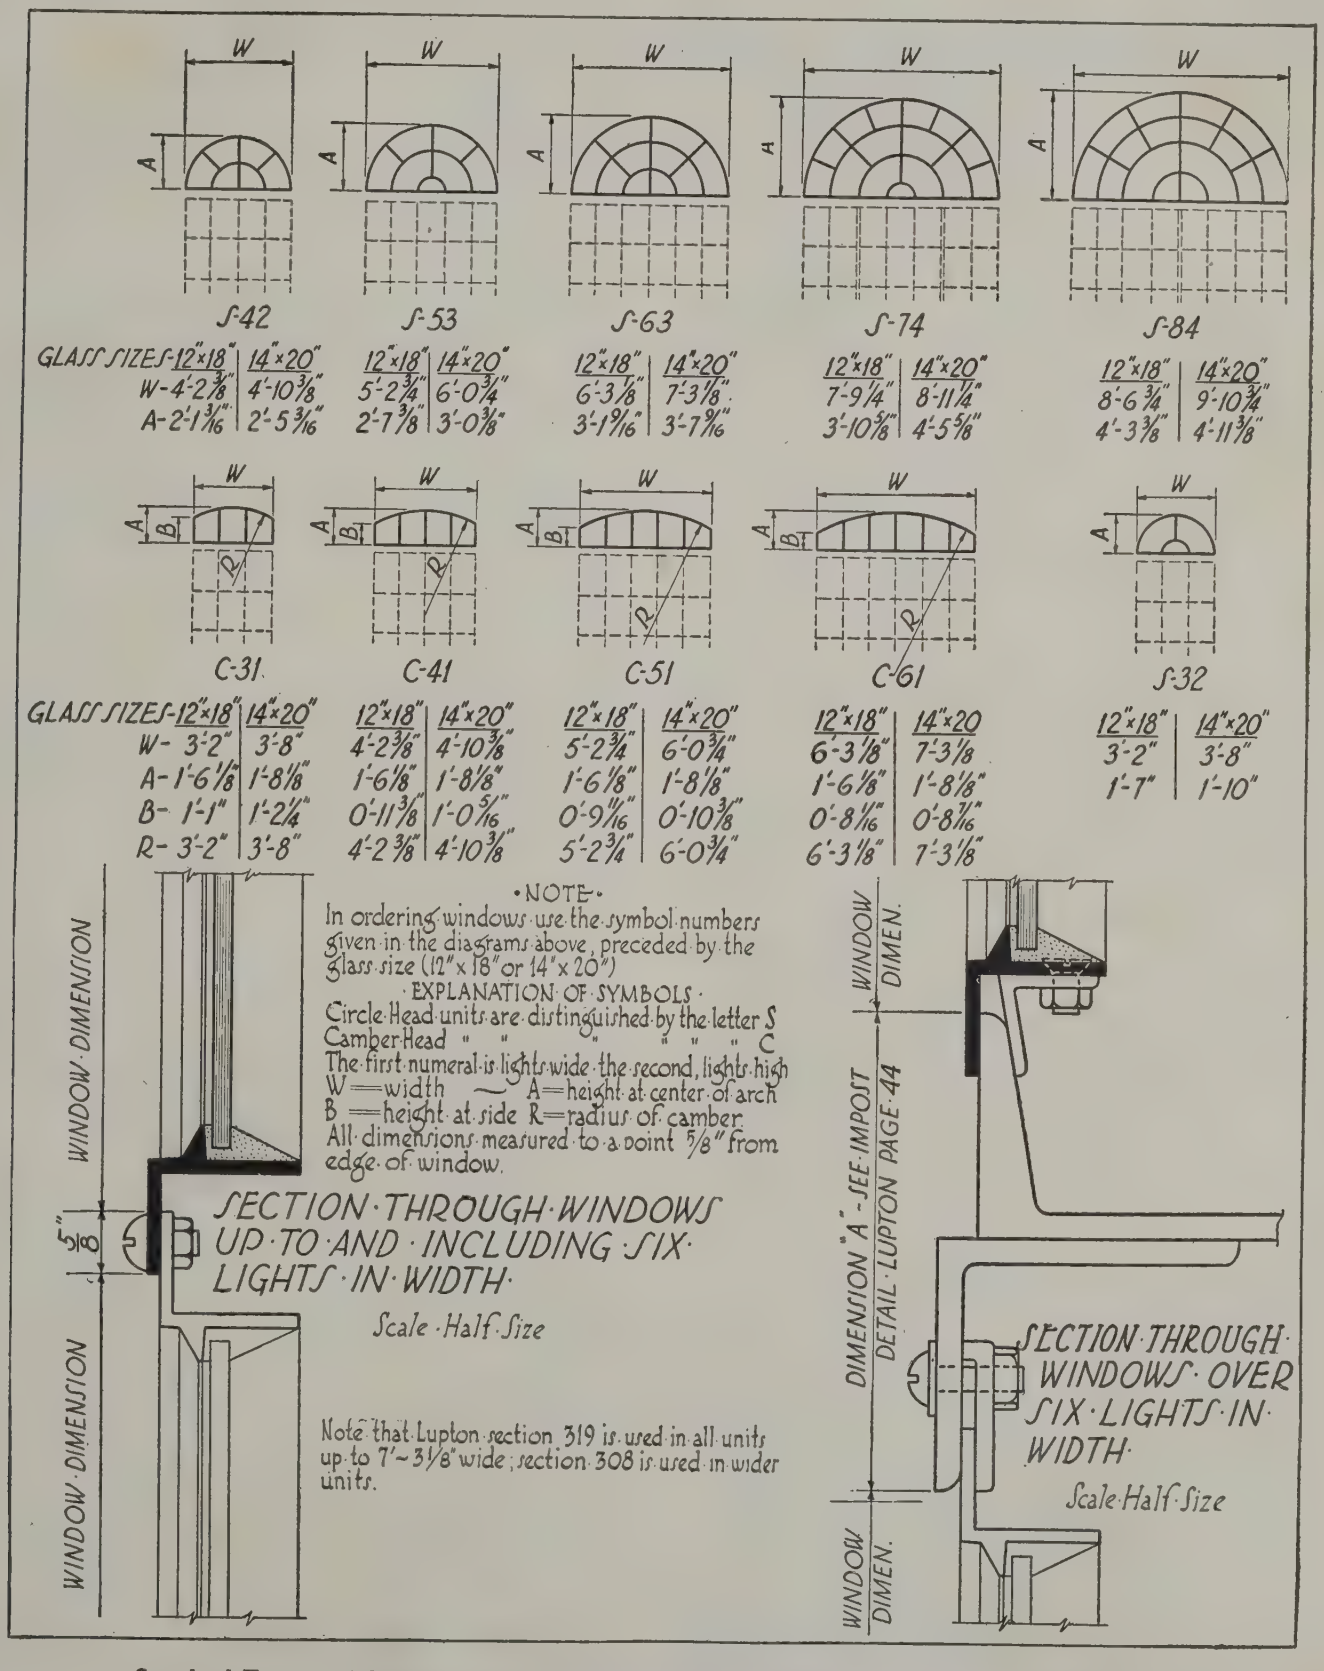
required 3 units taking 12 in. x 18 in. glass and having the window symbol 46181, this indicates that 2 mullion bars are required for each opening.

If more than one type of unit is required for a multiple opening, they must be listed separately, thus: One opening 2—12x18—36: 2—12x18—56181: 1—12x18—46183.

Camber and Circle Head Units

Standard Camber and Circle Head units shown below are made to fit above standard square head units taking 12 in. x 18 in. or 14 in. x 20 in. glass. Units other than those shown are special, require a longer time for fabrication and are higher priced. Units up to and including those 6 lights wide are bolted directly to the single square head unit below. Holes are punched in the flanges of the camber and circle head units for this purpose, but are not punched in the square head unit unless specified. Units over 6 lights wide are used above combinations of two or three square head units as indicated by the dash lines in the diagram and the impost detail for multiple unit openings shown on page 44 must be used.

In ordering always specify glass size (12 in. x 18 in. or 14 in. x 20 in.) as well as the number of the unit.



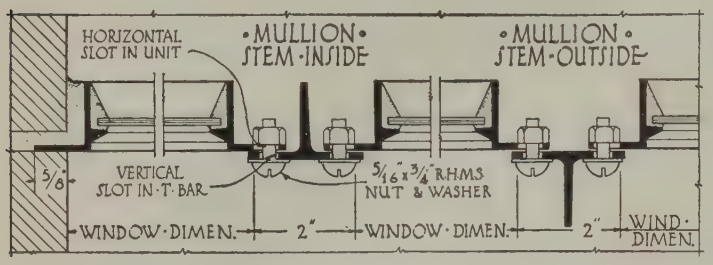
Standard Types and Sizes of Circle and Camber Head Units and Half Size Detail of Imposts

LUPTON PAGE 42

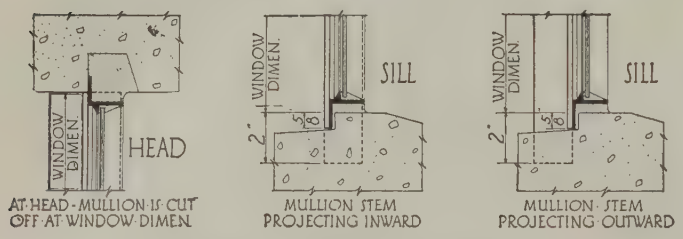
Continued on next page

Opening Dimensions

Window dimensions given in the diagram of sizes on page 41 are 1¼ in. less than overall dimensions of the unit and are measured to the points indicated in the details on page 44.



Details of Mullions



Details of Mullion Installation

Widths of Openings

The width of the opening for a single unit is identical with the window dimension of the unit.

The width of the opening for a multiple unit window is equal to the sum of the window-dimension-widths of the units plus 2 in. for each mullion. See detail on this page.

The table on this page gives opening dimensions obtainable with the various combinations of units. A handy celluloid slide scale for figuring heights and widths of window openings will be sent free on request.

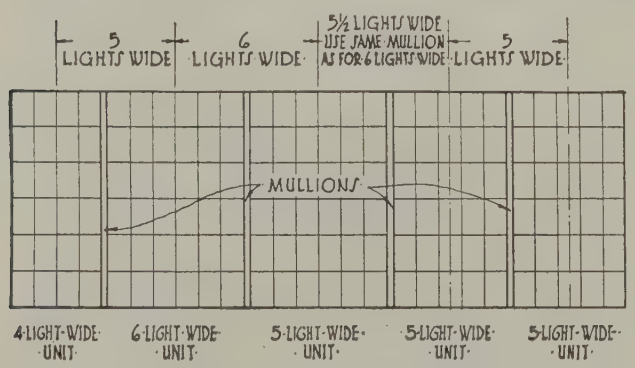
Limits of Heights of T Bar Mullions

I Up to { 5 lights wide x 4 lights high / or / 6 lights wide x 3 lights high } use { Section #121 with Stem Inside }

II Up to { 5 lights wide x 5 lights high / or / 6 lights wide x 4 lights high } use { Section #121 with Stem Outside }

III Up to 6 lights wide x 5 lights high use { Section #339 with Stem Inside }

IV Up to { 5 lights wide x 7 lights high / or / 6 lights wide x 6 lights high } use { Section #339 with Stem Outside }



Note: "Lights Wide" as used in the table above is considered as one-half the lights in the unit on the left of the mullion plus one-half the lights in the unit on the right of the mullion.

Mullions

Mullions are T bars, section 121 or 339 (see page 45). Flanges are always placed on the outside, but stems may project inside or outside as required for strength. See details and table on this page. Steel sills require that the stem always be placed outside.

Mullion is always cut off flush with the window dimension at the lintel. At the sill the standard cut is as shown in the drawing on this page. The flange stops flush with the bottom of the unit but the stem enters brick, concrete, tile and precast concrete sills to the depth of 1⅜ in. (2 in. from measuring point of window dimension).

When specified, the mullion stem can be cut off flush with the bottom of the window if it projects outside or, if the stem projects inside, it can be notched to clear the inside sill. It is advisable to cut mullions this way if the sill is of wood, or where it is not desired to provide grooves in cut stone sills for the mullion stems to enter.

Heights of Openings

The height of the opening required for a unit is considered as identical with the window dimension height. The outside face of the sill member, however, must be left uncovered as shown in details so that water may drain away from the window.

Imposts

Where units are placed one above the other imposts of structural steel, not furnished by Lupton, are to be used. Designs are given on this page.

Where circle head or camber head units are placed above regular units, structural steel imposts are not required unless the window is over 6 lights wide.

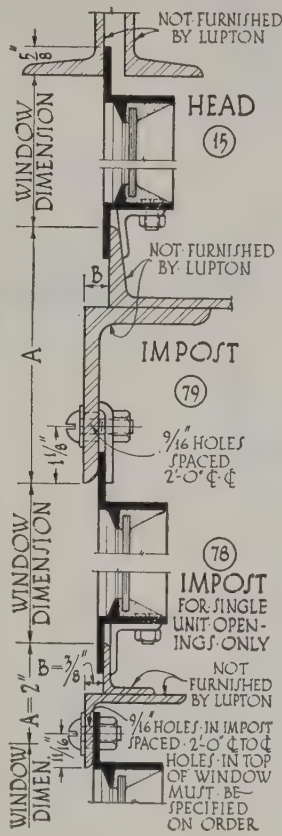
DEAD LOAD OF WINDOW & IMPOST TO BE SUPPORTED BY TIE RODS HUNG FROM BUILDING LINTEL AND ATTACHED TO IMPOST AT MULLION POINTS. TIE RODS NOT FURNISHED BY LUPTON.



Glass Sizes

Lights in stationary sections of Standard Window and Dealer Stock units are the full 12 in. x 18 in. or 14 in. x 20 in. size. The outside lights of all ventilators whether standard or special, are reduced 1 in. in width or height, or both, to allow for the space taken by the weathering around the ventilators. The diagram at right is typical of a unit using 14 in. x 20 in. glass, and shows the reduction in glass size in the ventilator. Other glass sizes are reduced in a similar way.

LUPTON UNDERWRITERS' PIVOTED WINDOWS

Lupton PHILADELPHIA UNDERWRITERS LABORATORIES, INC. INSPECTED FIRE WINDOW FRAME NO.S. A 100

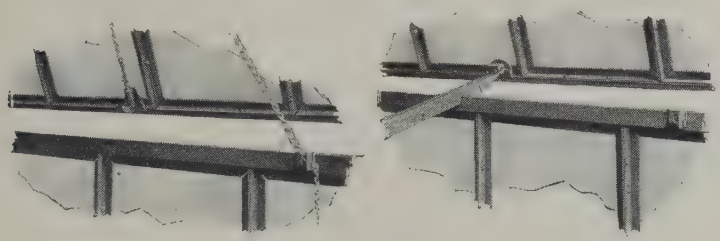
Important: Lupton Underwriters' Pivoted Windows are furnished only when specified in bid and mentioned in contract

Wherever wire glass is used for fire protection it is advisable to specify Underwriters' Windows and have the Underwriters' Label. This insures that the full measure of safety intended is actually secured.

Lupton Dealer Stock and Standard Windows of prescribed sizes may be converted into Underwriters' Windows by the addition of glazing angles and the special hardware illustrated on this page.

As all the members are standard, orders for Lupton Underwriters' Windows can be filled from bars in factory stock, subject only to the delay for adding the hardware and glazing angles. This is the most economical way to buy Underwriters' Windows. Such orders can usually be filled promptly after receipt of complete information.

Where immediate delivery is essential, Dealer Stock Windows can be altered at our Philadelphia, Cleveland and Chicago Warehouses, at a slight extra cost, to receive the special glazing angles and hardware before shipment. *Windows cannot be altered to receive Underwriters' Label after shipment.*



Spring Catch and Stay Bar

Former has fusible link in chain. Latter may be used instead of Catch and Chain, subject to approval of local inspection boards

It is important that the following information be given with the order:

1. Groupings of units in masonry openings. By this is meant the number and size of units in each masonry opening.

2. Detail of head, sill and jamb conditions on single unit openings as well as multiple openings.

The grouping of units is necessary as the allowable width of unit is less in a multiple opening than in a single opening.

The details at head, sill and jamb are necessary so that proper connections of window and mullions to the opening can be furnished.

This information is demanded by the Underwriters and the labeling of windows is held up by the inspector until this information is given to him.

The Underwriters' Requirements

Following are the Underwriters' Laboratories' specifications, in condensed form, so far as they apply to pivoted windows:

1. Single Window units cannot exceed 84 sq. ft. in area, with neither dimension exceeding 12 ft. When mullions are used, each window unit cannot exceed 7 ft. in width or 12 ft. in height.

2. The exposed glass area must not exceed 350 sq. in. in any light, measured from toe to toe of the glazing angles. (Standard sizes are less than this.) One-quarter in. wire glass is always required.

3. In addition to putty, the lights are held by steel glazing angles measuring ½ in. x $\frac{9}{16}$ in.: the long leg bears against the glass. The angles are held by steel screws.

4. Not more than two ventilators may be used in any window unit.

5. The hinge is of standard Lupton design and construction.

6. Spring catches are of standard Lupton construction. The catch is at the bottom of the ventilator, so that its own weight tends to engage it if the spring fails. The chain passes over a standard roller at the top of the ventilator.

7. The chain must contain a fusible link. When the link fuses, the ventilator closes and locks automatically.

8. With the approval of the local inspection board, stay bars for manual operation may be used instead of spring catches and fusible links.

9. Mullions must be Lupton Section 339 and must be anchored at head and sill, either by projecting into the masonry, or by angle clips furnished to suit the construction of the building.

10. Lupton Wall Ties No. 2472, or other wall ties not less than 4 in. long are required at brick and concrete sills.

11. Expansion clips must be used at the top and bottom rails of all ventilators. These clips serve as an additional locking feature in case of fire.

12. One stop lug per ventilator must be used to limit opening of ventilator to 135°. (On Lupton windows this lug is made integral with the filler plate at the pivot.)

13. Curved or splayed head units cannot be labeled.

Note: *There is no restriction on the over-all width of an opening, provided the mullions and window units conform to the above specifications.*

LUPTON COMMERCIAL PROJECTED WINDOWS

For Sidewalls of Industrial Buildings

Commercial Projected Windows in construction and application are essentially the same as Lupton Pivoted Windows. The ventilators, however, have the Lupton Projected movement. The ventilators are balanced by means of friction shoes to swing out at bottom and remain open in any reasonable position, without the use of stay bar or adjuster. Some of the standard units shown on page 48 have a small ventilator at the sill opening in-at-top and acting as a windshield when open. All wall details, mullion details and impost details as well as wall opening sizes are same as for pivoted windows.

SPECIFICATION FOR LUPTON COMMERCIAL PROJECTED WINDOWS

Work Included

1. Furnish and install where shown on drawings Lupton Commercial Projected Windows, manufactured by David Lupton's Sons Co., Philadelphia, Pa.

Note: All Lupton Commercial Projected Windows should be accurately listed and located either in schedules on plans or in specification. If more than one type of window or more than one type of hardware be desired, each type should be separately listed and located, or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop and installation drawings. These shall show scaled sections of windows and frame members, details of construction, hardware, anchoring, etc.

Materials

3. Sections shall be of specially designed, hot rolled, solid steel.

4. Frame Members shall be angle sections, Lupton Standard shape.

5. Muntins shall be special cruciform section 1⅜ in. deep.

6. Vertical mullions shall be hot-rolled, solid T-Bar section.

Note: Structural Steel members forming imposts are not furnished by the window manufacturer.

Construction

7. All Commercial Projected Windows shall be designed for inside glazing.

8. Both frames and ventilators shall be assembled by tenoned, riveted joints at the corners. Two corners of the ventilator shall be welded. Continuous, two point flat contact weathering shall be provided between ventilators and frames.

9. Muntin bars shall be continuous from top to bottom, and from side to side, between frame members or ventilator members. They shall be attached to frame members or ventilator members by tenoned, riveted joints and shall be so interlocked as not to decrease their ultimate strength at the intersection.

10. Vertical mullions shall be provided with bolts for frame attachment where two or more windows are placed side by side in the same opening.

11. Structural Steel Clips shall be furnished to attach window to steel structure in types to cover all possible conditions.

12. Sill anchor clips shall be furnished. At least one clip shall be used for each two lights in the width of a unit.

13. Each Ventilator shall be accurately pivoted on two Ventilator Arms of solid steel. The connections between the Ventilator Arms and the Window Frames shall be made by steel arm blocks.

14. Each Ventilator shall be equipped with two brass friction shoes, sliding vertically in the Ventilator Jambs to guide the Ventilator and prevent rattling. Each shoe shall be equipped with a rust-proofed, flat steel spring attached to the Ventilator to insure constant pressure at the Jambs.

15. Universal Clips—An angle clip 1⅛ in. x 1 in. x 2 in. long shall be riveted to the ventilator frame.

Note: The Universal Clip allows any type of Lupton Commercial Projected Window hardware to be attached to the ventilator before or after glazing.

Hardware

16. All hardware (listed below) shall be of malleable iron and shall be shipped unattached, carefully packed to prevent damage until applied for use.

17. Provide the following hardware:

For open out ventilators—Ring Type Cam Handle and Pull Down Ring.

For open in ventilators—within reach from floor—Cam Handle with straight grip.

For open in ventilators—beyond reach from floor—Spring catch.

Erection

18. All Commercial Projected Windows shall be erected by window contractor in prepared openings, unless otherwise specified.

Note: Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the installation details for Lupton Commercial Projected Windows. All grouting, pointing, etc. should be done by the mason contractor after the windows are set.

19. Lupton Commercial Projected Windows shall be set plumb and true, properly aligned and securely anchored before glazing. All ventilators shall be properly adjusted before glazing.

20. All hardware shall be applied under manufacturer's directions.

Painting

21. All windows shall receive one shop coat of window manufacturer's standard, dark gray paint, oven-dried.

Note: The following should be provided for in the paint specification: One additional coat of paint should be applied after erection before glazing. Further painting should be deferred until at least three weeks after glazing, to allow putty to set. One or more additional coats may then be applied as required. It is advisable to hold the painting contractor responsible for cleaning plaster or other foreign matter from the weathering surfaces of the windows in order that it may not be painted over and cause imperfect contact.

Glass and Glazing

22. Furnish standard wire glazing clips, four to each light.

Note: Specify glass and glazing under proper heading elsewhere in specification.

(a) Do not specify single thickness glass.

(b) Specify high-grade steel window putty (ordinary wood sash putty must not be used).

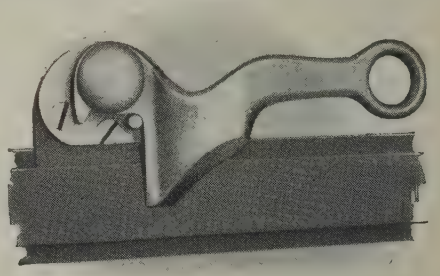
(c) Specify that Lupton Commercial Projected Windows shall be glazed from the inside; that the glass shall be set in a bed of putty and secured by Lupton standard wire glazing clips, four to each light, and that the putty shall be applied in a neat, clean manner.

Note: Do not paint until putty has set. See paragraph headed Painting.

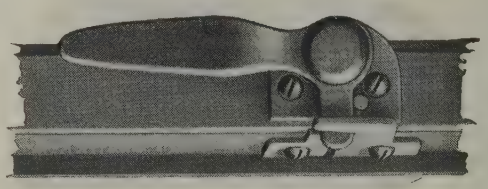
STANDARD HARDWARE

The following standard hardware of malleable iron, galvanized finish, will be furnished unless otherwise specified.

Pull-down Ring No. 151
Used at top of all Bottom-projected-out Ventilators



Ring Type Cam Handle No. 141
Used at bottom of all Bottom-projected-out Ventilators, mounted on universal clip



Right Hand Cam Handle No. 308
Used at top of Projected-in-at-top Ventilators

Hardware Alternates

Furnished only when specified. Numbers given are for malleable iron, galvanized.

Continued on next page

For Projected-In-at-Top Ventilators beyond reach from floor—Spring Catch No. 5, Keeper No. 7.

For Bottom-Projected-Out Ventilators beyond reach from floor—Spring Catch No. 3.

For Bottom-Projected-Out Ventilators beyond reach from floor—Chain roller guides No. 152 and No. 153 used with Spring Catch No. 3, instead of a Pull-down Ring.

Bronze hardware in standard or alternate types can be furnished at added cost when specified.

STANDARD SIZES

Dimensions for Commercial Projected Windows conform to dimensions for Pivoted Windows of the same glass size and number of lights.

In ordering always give the glass size (12 in. x 18 in. or 14 in. x 20 in.) followed by the symbol number which appears under the unit in the diagram below.

Explanation of Symbol Numbers and their *Use in Ordering* are given on Lupton page 41.

Note: The symbol numbers are the same as for Pivoted Windows except in the case of a unit having two ventilators of different sizes an extra numeral is inserted after the fourth numeral to indicate the number of lights in the upper ventilator.

For example—4522402 would indicate a unit having: 4 lights wide, 5 lights high, 2 ventilators, 2 lights in the lower vent, 4 lights in the upper vent, lower vent at sill, upper vent 2 lights from sill.

LUPTON OPERATING DEVICE

Lupton Operating Device is a high grade type of torsion operator in which the inherent weaknesses of the torsion type have been eliminated.

Designed for the operation of center pivoted side wall steel windows.

It can be applied as satisfactorily to existing windows as to a new installation. Operation is by hand chain or by hand wheel, the latter being used where several tiers of ventilators are to be operated from one station.

SPECIFICATION FOR LUPTON PIVOTED WINDOW OPERATOR—TORSION TYPE

Work Included

1. Furnish and install where shown on drawings Lupton Operating Device, manufactured by David Lupton's Sons Company, Philadelphia, Pa.

Note: Lupton Operating Device should be accurately listed and located either on schedules on plans or in specifications. If more than one type be desired each type should be listed separately or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show scaled details of construction, etc.

Materials and Construction

3. Power shall be a machine cut steel worm operating a gray cast iron segment worm gear assembled with a gray cast iron yoke and mounted on a malleable iron supporting bracket adapted to rigid attachment to building construction, or, by means of extension clips, to window mullion. The hub of the segment gear shall be drilled to fit the power transmission line and shall be tightly secured to it with set screws so as to rotate the line on the gear axis.

Note: There are two types of power shaft; 1 in. and ½ in. The larger will operate runs up to 40 ft. on each side of power, and not more than 12 average size ventilators. The smaller will operate runs up to 10 ft. on either side of power and no more than 4 average size ventilators.

4. Power shaft shall be standard black wrought iron pipe joined into a continuous line by standard threaded pipe couplings, screwed tight and secured by two ¼ in. steel pins.

5. Shaft shall be supported by malleable iron brackets attached to the window mullions or to the building construction.

6. Steel operating arms (one to each ventilator) shall be rigidly clamped to the shaft.

7. Connection between the operating arm and the ventilator shall be made by a steel vent rod and a malleable iron bracket mounted on the ventilator. Pivot pins at both ends of the vent rod shall be bronze.

Note: Specify operation by chain or by vertical steel shaft.

8. Chain Operation—Power shall be operated by No. 9 Register hand chain, operating over a chain wheel and guided by a guard. Both wheel and guard shall be gray iron castings. Wheel shall be accurately drilled, mounted in worm shaft and securely held by a set screw. Chain shall terminate approximately two feet above the floor.

Note: Where building construction makes it impractical to hang the chain directly vertical from the power (as in monitor window installations) single and double chain idlers may be specified (at added cost).

9. Steel Shaft Operation—Power shall be operated by a vertical ¾ in. round, cold rolled steel shaft, coupled directly to the worm shaft with a malleable iron coupling. The shaft shall be supported by adjustable malleable iron brackets spaced not over 6 feet apart, one bracket always being placed at the lower end of the shaft, approximately 4 feet above the floor.

Note: Lower end of shaft may be terminated in either one of two ways, specify which.

10. Wheel in horizontal plane. A gray iron hand wheel and handle shall be mounted on the lower end of the shaft.

11. Wheel in vertical plane. The shaft shall be directly

connected by a malleable iron coupling to a pair of miter gears of cut machine steel assembled with a gray iron hand wheel and handle on an adjustable malleable iron bracket.

Note: When specified a gray cast iron housing is furnished for the miter gears at added cost.

Note: Where building construction makes it necessary, universal joints for the vertical shaft may be specified (at added cost). The angle between two adjacent lengths of shaft must not be less than 135°.

Erection

12. All operating devices shall be erected and adjusted to proper working order by the window contractor.

Scale ½ in. = 1 ft. 0 in.

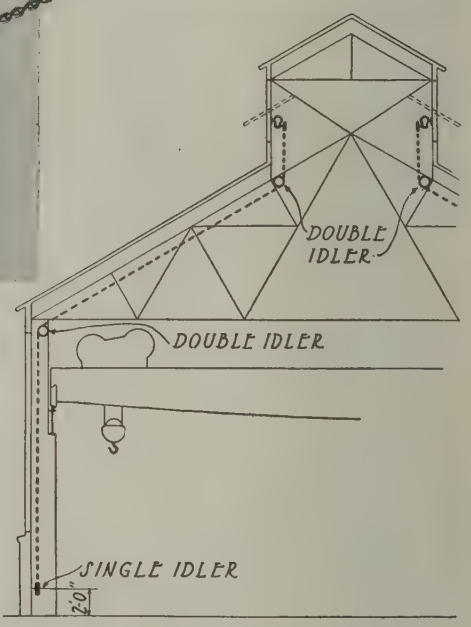
Painting

13. All operating devices shall have one coat of manufacturer's standard, dark gray paint, oven dried and applied before shipment.

Note: The following should be provided for in the paint specifications—One coat of red lead and oil should be applied after erection followed by one or more coats of finishing paint as required.

Application of Chain Operator to Monitor Windows

This arrangement of chain and idlers is also used for the Pond Operating Device described on page 57.

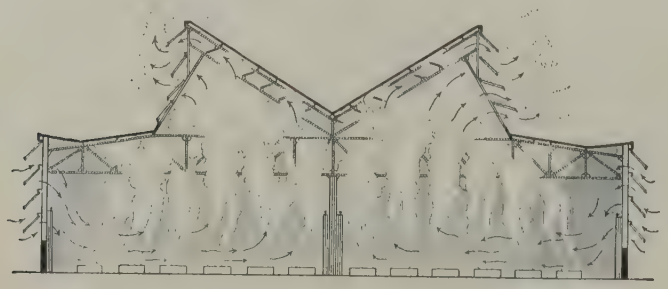


POND ROOF DESIGN

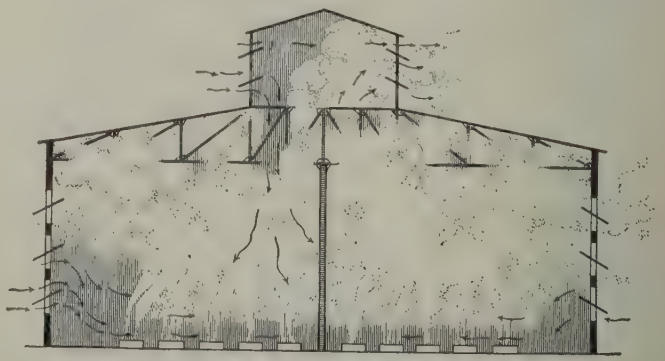
The Pond Roof Design was evolved to supply needed ventilation and daylight to foundries and similar buildings in which heat and gases are produced as a by-product of manufacturing processes. It corrects the faults of other roof designs, in that it quickly and thoroughly clears any size building of heat, foul air, or smoke. It provides large outlets arranged to receive the ascending air and heat currents with minimum lateral draft. There is no place anywhere within the steep planes of the V-shaped portion for stale air to be pocketed.

While ventilation and lighting are the primary functions of the Pond Roof, it gives maximum weather protection, because it incorporates the use of top hung continuous windows which are in themselves a weather protecting element.

The remarkable efficiency of the Pond Roof Design,



Cross-section of Typical Pond Truss Foundry Showing Ventilation Features



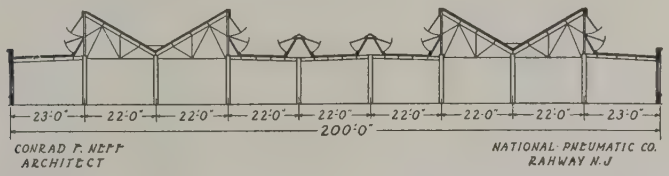
Cross-section of Typical Old Style Foundry

Continued on next page

Pond Roof Design—Continued

both in ventilation and light distribution, has led to its adoption in many manufacturing buildings in various industries, regardless of size. These include automobile, rubber, glass and airplane factories in addition to a great number of foundries and buildings devoted to the metal manufacturing industries.

The Ventilation Features—The old style monitor type roof proved faulty in several ways. Its outlets are too small for free discharge of individual heat streams. The center pivoted monitor windows allow rain and snow to blow over them, and cross winds to enter, chilling the warm monitor and causing down drafts. Consequently the windows needed much closing and opening and had no ventilating value except under the most favorable conditions.

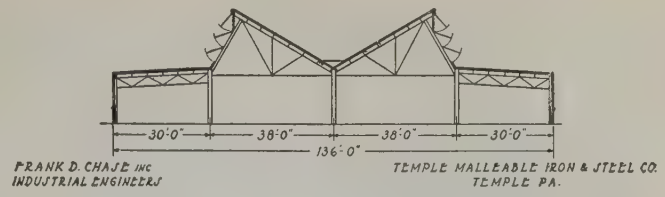


Cross-section Showing Two Pond Trusses with Pond A-Frames Between Them. The A-Frames Provide Inlets for Fresh Air in Wide Buildings

Pond Roof Design gives complete ventilation where the monitor failed. It provides for proper relation of fresh air inflow to stale air elimination. Buildings of unusual width are satisfactorily ventilated by the use of several Pond Trusses with a Pond A-Frame located between them. The lower the roof, in a heat producing building, the better. A Pond Roof need not be higher than is required for crane clearance.

The Lighting Features—The superiority in the lighting features of the Pond Roof Design is the result of carefully planned construction. The continuous windows in the sides of the truss permit lighting through a wider angle than other roof construction. A portion of light strikes the slopes of the roof, which results in a breaking up of light rays and a more widely spread diffusion of light. The combination of crossing rays produce an even lighting throughout the entire building.

There is no necessity of locating the building or its roof design in a theoretical position for interior lighting,



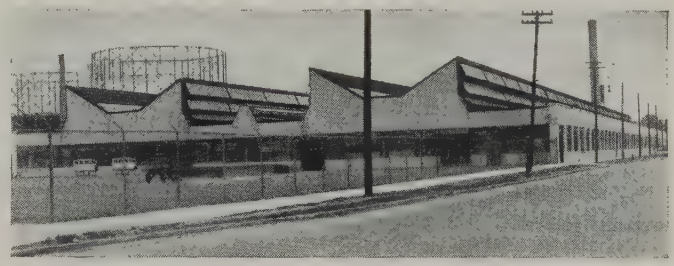
Cross Section Showing Pond Truss

for the lighting is from practically all sides, hard shadows are absent and workers can see clearly even when facing the window because of the light from behind.

Owing to the light distribution, a Pond Roof requires less glass area than a saw-tooth roof for equally effective lighting, thus saving fuel. Investigations show that added cost of steel for a Pond Roof will be more than offset by a few years' fuel saving.

Fuel losses can be reduced and the average summer temperature decreased by the use of a suitable insulation between the roof slab and weather-proof covering. Exposed cement tile should be avoided.

Pond Roof Design is not a stock design. For its correct and most efficient use, the proportions of Pond Trusses and A-Frames should be worked out for each particular case. Lupton Engineering service is available, to study your problem without obligation, and give our recommendations to insure a better lighted and ventilated building.



Ford Motor Company, Lincoln Division, Detroit, Mich.
ALBERT KAHN, Architect. WALBRIDGE, ALDINGER Co., Contractors

Two large Pond roof designs with an A-frame between them. All hung with Pond Continuous Windows. Each line of window is 842 ft. long and controlled by a single Pond operating device, motor driven. Lupton has equipped Ford plants in Jacksonville, Fla.; Norfolk, Va.; Dallas, Texas; Los Angeles, Cal. and Louisville, Ky.

POND CONTINUOUS WINDOWS

These windows are designed for lighting and natural ventilation in roofs of all buildings and for sidewalls of industrial buildings where mass control of ventilation is necessary and desirable. Units can be joined end to end, by means of weatherproof expansion joints, to form a continuous window for openings as long as 1000 feet. Long runs such as this can be operated by a single motor driven Pond Operating Device described on pages 57-59. When the windows are opened, there is formed over the opening a continuous awning of glass and steel that effectively prevents the entrance of rain, thus permitting ventilation in stormy weather. Storm panels are provided at the ends of runs to keep the rain out at these points.

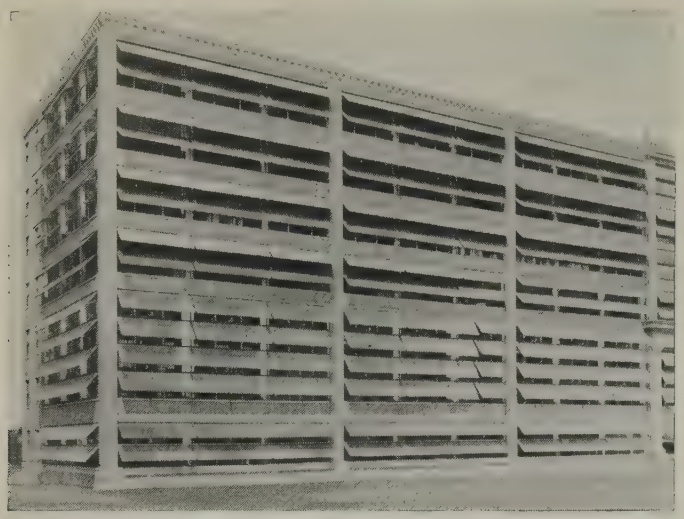
In Roofs—Their most effective use is in the Pond Roof construction described on page 51, for industrial buildings with heat processes. The Pond "A" Frame is the most inexpensive, practical ventilating skylight for roof lighting of other types of buildings. When furnished with Pond Continuous Windows, sawtooth and monitor roofs give the best results of which they are capable.

Pond A-Frame in Roof, with Two Lines of Pond Continuous Windows in the Sides

This is one of several uses for this type window

Continued on next page

In Sidewalls—They can be used either in short lengths between pilasters or in long runs hung outside the wall columns.

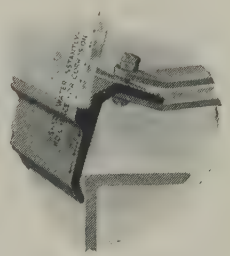


Firestone Tire & Rubber Co., Akron, Ohio, Mechanical Building
OSBORN ENGINEERING CO., Engineers

By using Pond Continuous Windows it is possible to work close to the windows without need of shutting them in case of rain. Every third column breaks the lines of windows. Other columns are spaced on 20 ft. centers and are set inside windows. Upper and lower lines of windows, each 56 ft. long, are connected in pairs and opened simultaneously by Pond Operating Device with hand chains

Operation—Is by Pond Operating Device either hand or motor power. See pages 57-59 for description and details.

Members—Are solid one piece rolled steel sections. The sill member (section 360) is especially designed to shed water even when the window is open. Full size sections are shown on page 56.



Sill Member Section 360

Welded Assembly—At the joints the members are coped and solidly oxy-acetylene welded along the entire length of contact. In this way the maximum strength of each member is utilized and the unit becomes a single rigid piece. There is no possibility of loosening joints with resultant cracked putty and broken glass.

Expansion Joints—Expansion joints are provided between units to allow for unavoidable inaccuracies in building construction and variations in length due to temperature. A section through an expansion joint is shown on page 54. The frame member of one unit (section 326) overlaps the frame member (section 350) of the adjacent unit. The units are held together by an "expansion plate" and bolted as shown.

Sizes of Units and Openings—There are four standard heights of units: 3 ft., 4 ft., 5 ft. and 6 ft. These are overall dimensions. Clear heights of openings, from head girt to sill girt for any unit, are 1½ in. less than the overall height of unit. These heights must be carefully maintained in placing steel work, see details page 54.

Standard units are 20 ft. long with muntins approximately 2 ft. 0 in. center to center. Shorter length units, 10 ft., 12 ft., 14 ft., 16 ft., 18 ft. long, are used at the ends of runs as needed to suit the openings.

Storm and End Panels—In roofs, combination storm panels are recommended for use with operated lines; with stationary lines short end panels are used. Either type of panel extends 2 ft. beyond the end unit, usually to the approximate center line of a truss.

Dimensions from out to out of these panels are always even feet; no odd feet nor inches. To these even feet dimensions must be added not less than 1½ in. at each end (more if desired) for clearance and end flashings. Thus opening lengths are expressed as 84 ft. 3 in., 136 ft. 3 in., etc. Clearances exceeding 1½ in. at each end must be filled out with additional flashing.

In the Side Walls—Between pilasters, special width units and glass are sometimes necessary. The end rails of formed plate (section 326) overlap special plate weathering furnished by us, see details page 54. Width of opening is specified by architect. Weathering is of standard overall width (5½ in.) and is located to project from the masonry from 1½ to 3½ in. This gives an allowable variation of 4 in. in width of unit and saves needless glass cutting.

Weathering is set in pilasters by general contractor before the face brick or concrete is applied. We furnish a sketch showing its location and that of the two holes to be punched by the general contractor in the head girt angle to carry it.

Standard Glass Sizes—Standard glass heights are 3 in. less than the standard or overall heights of the units, i. e.:

No. 3 Unit 3 ft. high.....33 in. glass
No. 4 Unit 4 ft. high.....45 in. glass
No. 5 Unit 5 ft. high.....57 in. glass
No. 6 Unit 6 ft. high.....69 in. glass

Standard lights are 23 and 24 in. wide, these widths being combined as needed to make the desired length of unit.

In ordering glass for replacement, the width and height for each light must be specified.

In ordering new units, only the nominal length of the units need be specified.

Steel Work Required—Structural Steel Work required for the installation of Pond Continuous Windows and Continuous Window Operators, described in the Specifications and shown in the details for these products, is not furnished by Lupton. We furnish drawings showing punching in girt angles for attaching hinges, but the punching is done by the steel contractor.

Clearances Required—Clearances for hinges, overlap at sill, and operators must be strictly maintained. They must be kept free of rivets and other obstructions. All structural steel supporting windows must be straight and true, and must be directly attached to steel columns to avoid faulty alignment due to use of brick walls for support.

All estimates are based on our standard construction as shown in details. Extras will be charged for any special construction necessitated by departure from dimensions and clearances here indicated.

Flashings—All joints in sill and intermediate girt angles, all combination storm panels for operated windows, and short end panels for stationary windows, require flashings as shown by details on pages 54-55.

We do not furnish these flashings; they should be supplied by the sheet metal contractor. We will not be responsible for the weatherproofness of Pond Continuous Windows where flashings are omitted.

Windows between pilasters require special end weathering in jambs which we furnish. See Detail on page 54 for dimensions needed, covering both window and weathering.

SPECIFICATION FOR POND CONTINUOUS WINDOWS

Work Included

1. Furnish and install where shown on drawings, Pond Continuous Windows, manufactured by David Lupton's Sons Co., Philadephia, Pa.

Note: All Pond Continuous Windows should be accurately listed and located either in schedules on plans or in specifications. If more than one type of window be desired, each type should be separately listed and located or otherwise clearly designated. These details insure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show scaled sections of window and frame members details of construction, anchoring, etc.

Materials

3. Frame Members.

Note: Structural steel members forming frame are not furnished by window contractor. They should be specified under the proper heading elsewhere in the specifications of other trades. The members required are shown on the details and are as follows:

(a) A continuous girt angle at the head, to which the hinges are bolted. This angle should not be smaller than 3 in. x 3 in., ¼ in. to ⅜ in. thick. (Punching for hinges is not done by window contractor.)

(b) A continuous member at the sill. The face of this girt (usually an angle or a channel) should be in the same plane as the face of the girt angle at the head.

(c) A continuous girt angle between upper and lower lines of windows where one line is placed directly above the other. This member should be the same size as girt angle at head when windows above and below are both vertical or both sloping, but when windows above are vertical and windows below are sloping, the leg to which hinges for lower windows are bolted, should be at least 4 in. long.

4. Window Sections—Top rail, bottom rail and end rail shall be special hot rolled solid steel sections. Bottom rail shall be patented sill section No. 360.

Overlapping end rail shall be 12 gauge steel plate, formed.

5. Muntins shall be special hot rolled steel T section.

6. Jamb weathering of 12 gauge steel plate, formed, shall be furnished (but not installed) by the window contractor where the window extends between pilasters.

7. Flashings.

Note: Under proper heading elsewhere in specifications of other trades, specify sheet metal flashing at joints of and over gaps between girts, and condensation gutters (where required). These are not furnished by the window manufacturer.

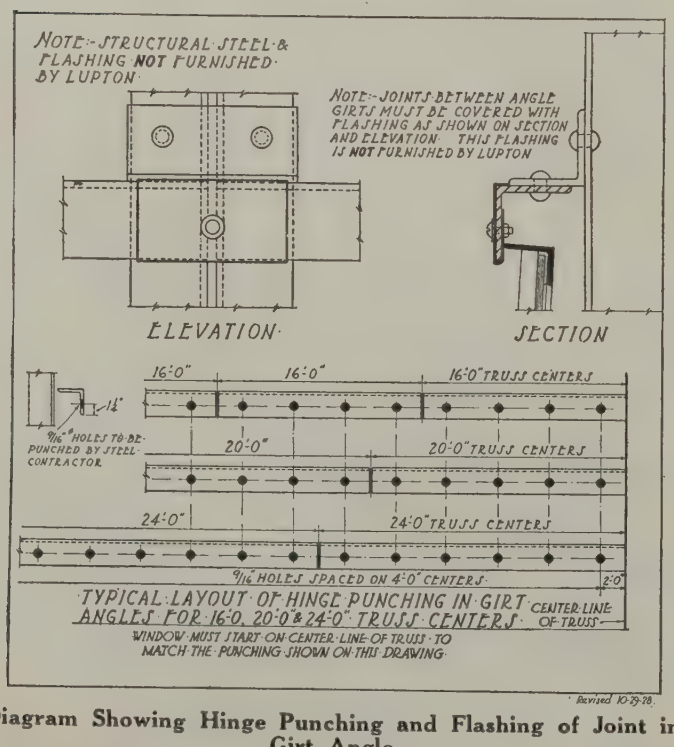

Diagram Showing Hinge Punching and Flashing of Joint in Girt Angle

8. Steel Clips shall be furnished for storm panels and stationary windows.

9. Glazing wedges shall be of galvanized pressed steel.

Construction

10. All Pond Continuous Windows shall be designed for outside glazing.

11. All windows shall be straight and true with members in alignment and surfaces in a plane. All joints shall be rigid and tight. Members shall be coped, fitted together and oxy-acetylene welded along their entire length of contact so that their ultimate strength at the juncture will not be decreased.

12. The windows shall be hung on malleable iron hinges with heavy bronze pins.

13. Muntins shall be continuous from top to bottom of window. Joints at top and bottom rails shall be oxy-acetylene welded.

Mechanical Operators

Note: Pond Operating Device for Pond Continuous Windows is covered in another specification.

Erection

14. All Pond Continuous Windows shall be erected in prepared openings by the window contractor. They shall be set plumb and true, properly aligned, securely attached to structural members and properly adjusted before glazing.

Note: (a) Include under the proper heading elsewhere the specifications in other trades, that all structural steel members that come in contact with Pond Continuous Windows shall form straight parallel lines and shall be located, punched and flashed in accordance with the Pond Continuous Window details. Where there is a deflection, structural members shall be straightened in the field by the structural steel contractor before windows are erected.

(b) Include in the masonry specification that all masonry openings shall be accurately constructed in accordance with the Pond Continuous Window details and that all mortar grouting, pointing, etc., shall be done by the mason contractor after windows have been erected.

Painting

15. All Pond Continuous Windows shall receive one shop coat of window manufacturer's standard, dark gray paint, oven dried.

Note: The following should be provided for in the paint specifications. One additional coat of paint should be applied after erection, before glazing. Further painting should be deferred until at least three weeks after glazing to allow putty to set. One or more additional coats may then be applied as required.

Glass and Glazing

Note: Glass and Glazing should be included under the proper heading elsewhere in the specifications of other trades.

(a) Specify vertical ribbed glass ¼ in. thick. (Ribs to be placed on the side least exposed to dust.)

(b) Specify special P. C. W. putty (obtainable from Lupton Representatives). Ordinary wood or steel sash putty should not be used.

(c) Specify that glass shall be set in a bed of putty and secured by steel glazing wedges supplied by the window manufacturer. Four wedges per light shall be used on windows 3 or 4 ft. high and six wedges per light shall be used on windows 5 or 6 ft. high.

Power House Type Windows

Power House Type Windows are made of the same sections as the regular Pond Continuous Windows. The units, however, are shorter than generally used for Pond Continuous Windows and are set one above the other in as many tiers as required for the needed height. The structural steel frame in which the units are set is furnished by Lupton. Glass is held securely by glazing angles, which are continuous along the muntins and vertical side rails.

Both the window and operator usually have to be designed to meet special conditions and therefore a Lupton representative should be consulted for details.

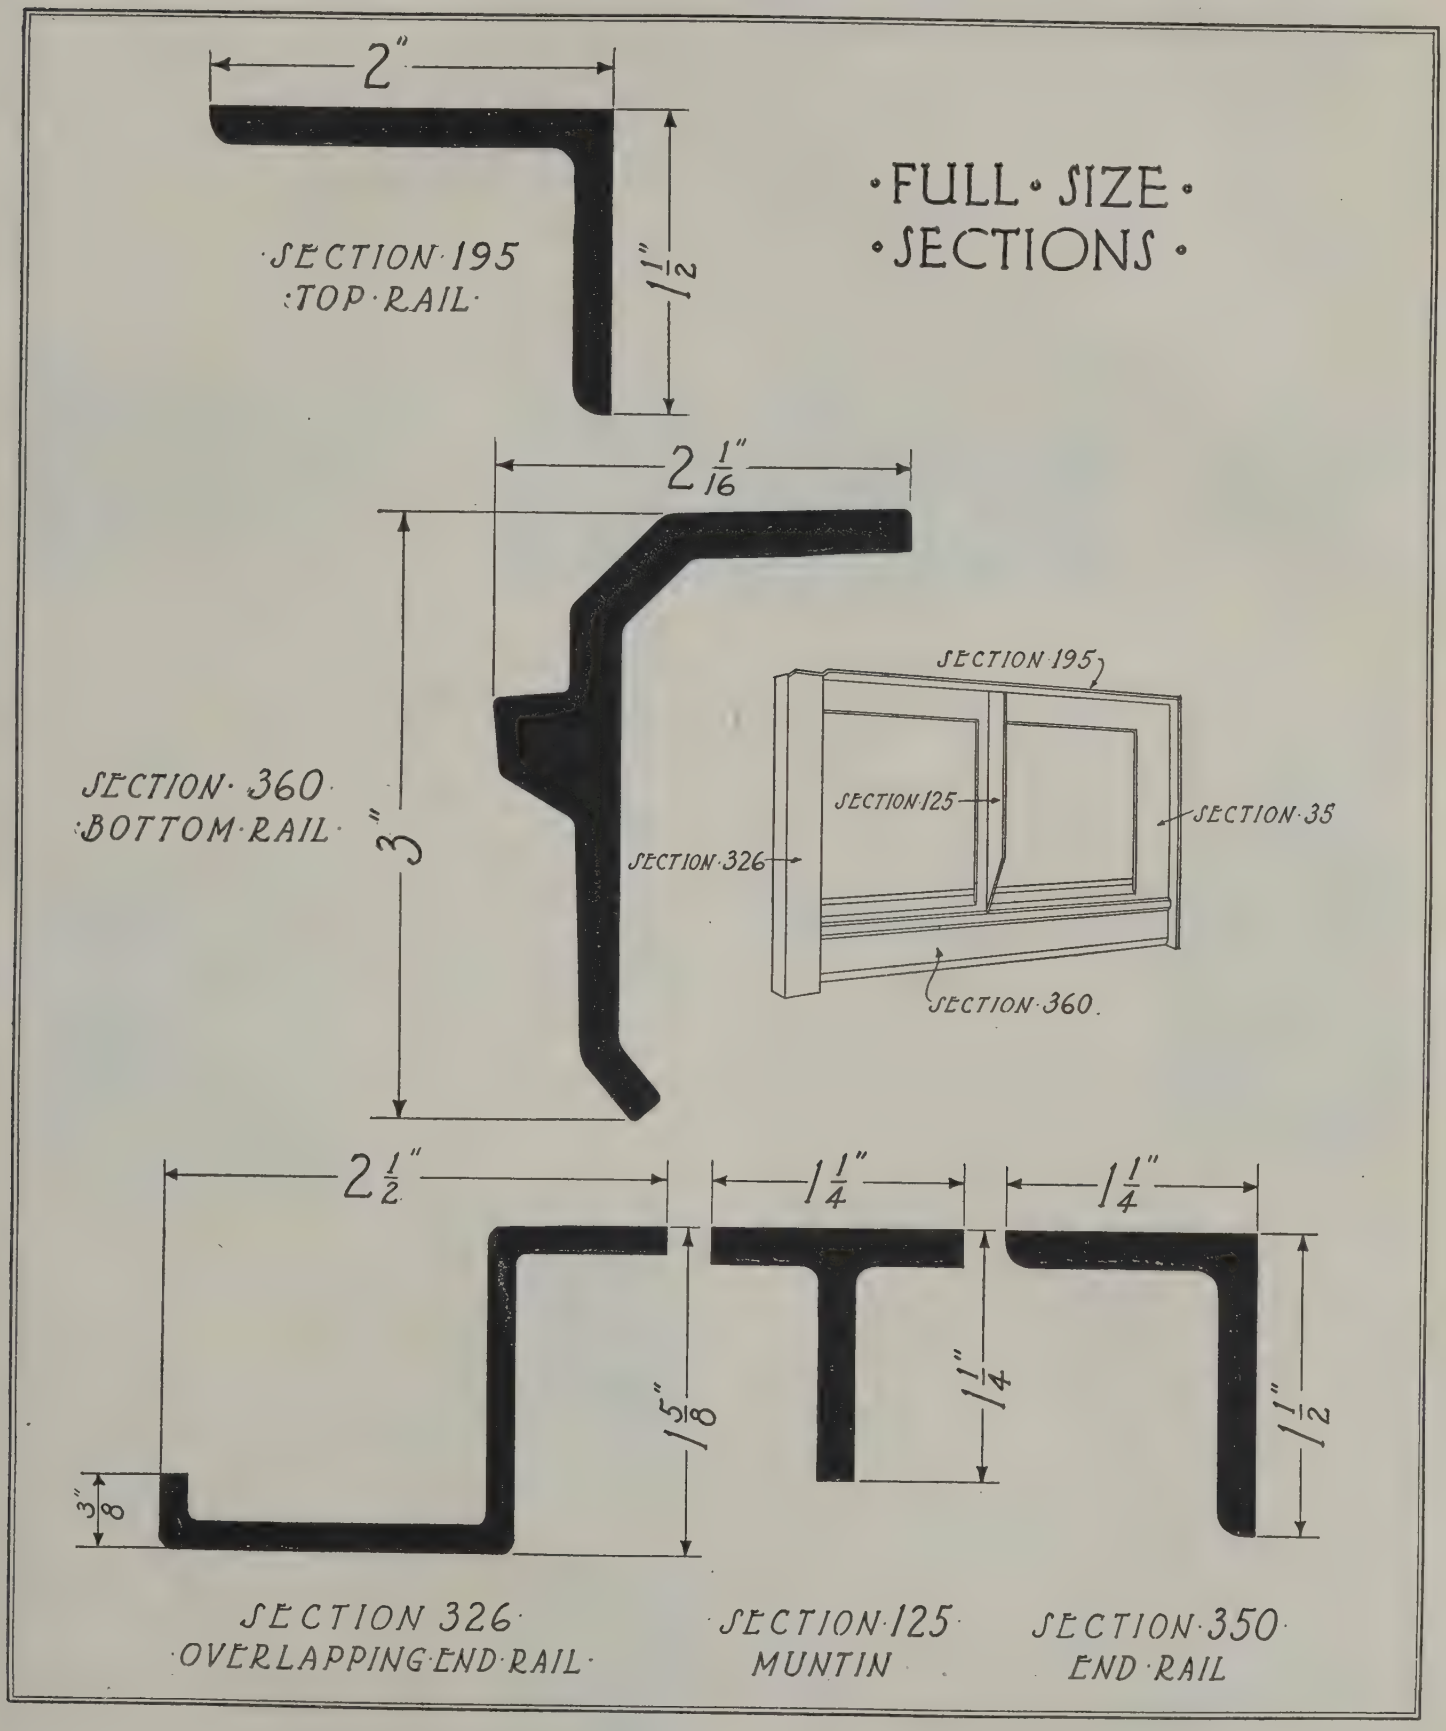
POND CONTINUOUS WINDOW SECTIONS



Continued on next page

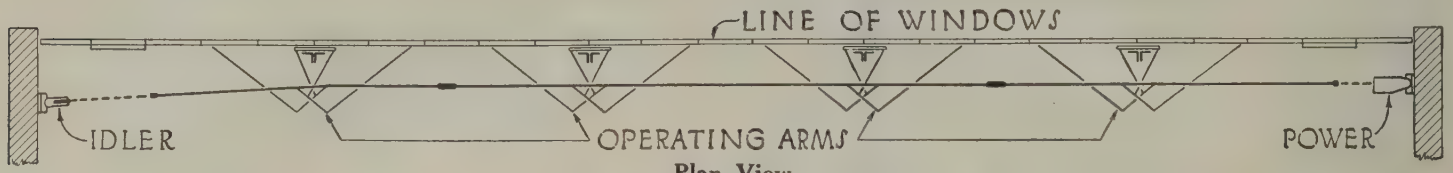
POND OPERATING DEVICE

Continuous Window Operator—Tension Type

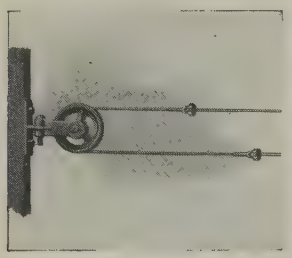
Pond Operating Device is designed on the tension principle of power transmission and is intended primarily to operate long lines of top-hung Pond Continuous Windows.

It is recommended also for simultaneous operation of pivoted windows in installations where the requirements exceed the limit of the Lupton Operating Device described on pages 50-51.

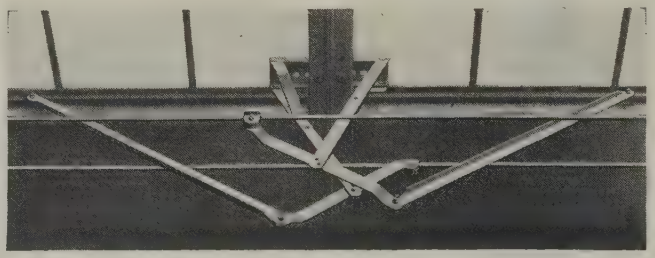
Pond Operating Device can be hand operated or motor driven.



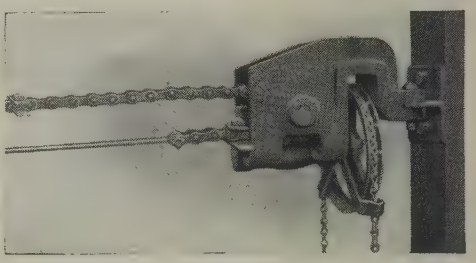
Plan View



Idler

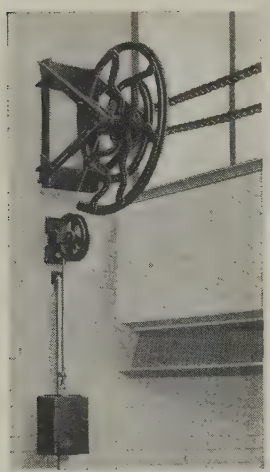


Operating Arms (Window in Closed Position)



Hand Operated Power

Idlers and Spirals



Spiral and Counterweight

The idler pulley is intended for use with hand-operated runs of from 150 to 300 ft. in vertical openings, depending on the height of the unit (150 ft. for 6 ft. units, 300 ft. for 3 ft. units). Such runs on the standard slope of 30 degrees, may be from 100 to 200 ft. long.

The length of these runs can be approximately doubled by using Spirals and Counterweights, and the number of operating powers reduced one-half.

For these long runs, the Spiral is used in place of the idler. The Counterweight is hung on a steel cable which winds on the Spiral. Thus a tension is applied to the transmission rods which balances, approximately one-half the load. A guide is included with the Spiral and Counterweight.

Motor-operated runs of Continuous Windows can also use Spirals and Counterweights. They make the motor load and speed substantially uniform, and prevent excessive overload on starting the motor with the window partly open. For very long motor-operated runs, they should always be used.

Spirals and Counterweights must be specified in bid and order if desired. They should be considered for use in any condition where additional power might be necessary. Spirals and Counterweights are an exclusive feature of Pond Operating Device.

Structural Work Required

All structural supports for Pond Operating Device are furnished by the structural contractor. This includes supports for the power, and for the compound levers attached to the transmission rods. We furnish detail blueprints as needed.

Width of Opening

The table below gives openings of Pond Continuous Windows by Pond Operating Device:

3 ft. high top-hung continuous windows 46° or 28 in.
4 ft. high top-hung continuous windows 47° or 38 in.
5 ft. high top-hung continuous windows 42° or 43 in.
6 ft. high top-hung continuous windows 36° or 44 in.

Single and Double Idlers Are Used Where Hand Chain Must Be Operated from a Position Not Directly Under the Power

Motor Driven Power

Pond Operating Device, Motor Driven, ventilates the large industrial plant with the same precision and completeness as it does the small plant, by co-ordinated, uniform control.

The ideal ventilating result is obtained by operating all the windows by motors, with switches so located that both inlets and outlets may be regulated by the same person, preferably the foreman or shop superintendent. To control the air change or to open or close the windows for any reason then requires only the pushing of a button.

Thus it is possible to combine the efficient organization of the great industrial plant with even more than small-shop facility in ventilation control. If certain bays require separate control, their switchboards can be located accordingly. Sometimes the floor space is divided between different departments having different ventilating requirements. The molding floor, the core departments, and the cleaning floor of a foundry, for example if under one roof, should each have its own window control.

In ventilating large buildings, one of two general purposes obtains. These are:

(1) To centralize and make easy the control of windows in buildings of unusual size, where the opening of short runs of windows by hand would take too long and possibly be neglected.

(2) To operate many windows quickly, as in a large foundry in winter, when it is desired to open them for a few minutes to get rid of the smoke without unnecessary loss of heat.

Both of these purposes are satisfactorily accomplished by Pond Operating Device, Motor Driven.

Explosion Type Operator

The explosion type operator is for use in chemical or rubber process buildings, granaries or other industrial buildings where explosion hazards are more or less unavoidable. The explosion operators are made in two types to operate Pond Continuous Windows. The counterweighted type can be adjusted to operate automatically at any desired atmospheric pressure. The pressure type operator requires the explosive pressure to open the windows. It is recommended for storage buildings where there are no workmen. Both operators continue to hold windows open after explosion has occurred, allow the poisonous gases and smoke to escape and insure a quick change of air.

SPECIFICATION FOR POND OPERATING DEVICE

Work Included

1. Furnish and install where shown on drawings Pond Operating Device, manufactured by David Lupton's Sons Company, Philadelphia, Pa.

Note: Pond Operating Device should be accurately listed and located either on schedules on plans or in specifications. If more than one type be desired each type should be listed separately or otherwise clearly designated.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show scaled details of construction, etc.

Material and Construction

Note: Structural Steel supports for Pond Operating Device are not furnished by the window contractor. These consist of uprights (angles, channels or tees) for attaching the operating arms.

For windows 5 or 6 feet high the center spacing of the supports should not be less than 7½ ft., nor more than 16 ft.; for windows 3 ft. or 4 ft. high, the spacing should not be less than 6½ ft. nor more than 15 ft. Trusses on 20 ft. centers, with one intermediate usually make the most economical arrangement for steel work.

3. **Power**—The operating power unit shall consist of a machine cut steel worm shaft mounted in ball-bearings operating a machine cut worm wheel. For manually operated powers the worm wheel shall be a steel casting made integrally with the sprocket wheel. For electrically operated powers the worm wheel shall have a bronze rim with cut teeth. Bearings shall be phosphor bronze. The power unit shall be assembled in a dust-proof, grease packed, cast steel case. The worm shall lock the window in any position.

4. **Power Brackets**—Power units shall be mounted on brackets made of structural steel angles, trussed to the building construction and designed to withstand the lateral stresses caused by operating the windows.

Transmission Line

5. Transmission line shall consist of 2 lines of solid round steel rods. (*Note:* Specify ½ in. or ¾ in. diameter as required by conditions.) Where joints occur rods shall have the ends hot headed and securely clamped in malleable iron couplings so as to develop the maximum tensile strength of the rods.

6. At the end of the run the two rods shall be connected by a sprocket chain passing over the sprocket wheel in the power unit.

7. Forged steel turnbuckles shall be furnished to adjust the transmission line.

8. The rods shall not be run through guides, rollers or other bearings.

Note: There are two ways of terminating the end of the run opposite the power.

(a) With an idler, (b) With a spiral and counter weight. Specify which one is desired.

9. (A) At the end of the run opposite the power unit the two rods shall be connected by a ⅜ in. steel wire cable passing over an idler wheel. Bearing in idler shall be phosphor bronze.

(B) At the end of the run opposite the power unit the two rods shall be connected by a sprocket chain passing over a sprocket wheel of steel cast integrally with a spiral. A weight shall be attached to the spiral by means of a steel wire cable in such a way that as the windows open the weight shall exert increasing force on the transmission line and balance a part of the load.

Operating Arms

10. Operating arms shall be mounted in pairs on a 4 in. channel bracket. Bracket shall be rigidly bolted to structural steel supports furnished by others. Arms shall be of flat steel specially constructed to form a rigid T shape and so arranged that all back thrust from the windows shall be transferred into tension in the transmission line.

The stem of the T shall be pivoted to the 4 in. channel bracket. Of the other two extremities of the T, one shall be pivoted to a malleable iron clamp, securely fastened to the transmission rod, and one shall be pivoted to a steel vent rod (of 1¼ in. x 1¼ in. x ⅛ in. angle) in turn pivoted to the flange of the bottom rail of the window. All bearings in the operating arms shall be phosphor bronze.

Note: Specify either manual or electrical operation.

Manual Operation

11. Manual Operation Power unit shall be operated by a No. 9 Register hand chain passing over a chain wheel mounted on the worm shaft and secured to it by a set screw. Chain shall be guided by a suitable guard.

Note: Where building construction makes it impractical to hang the chain directly vertical from the power (as in monitor window installations) single and double chain idlers may be specified (at added cost).

Electrical Operation

12. Electrical Operation Power shall be operated by an electrical power unit operating a sprocket and chain. Sprocket shall be mounted on the worm shaft secured to it by a steel key. Electrical Unit shall be located beneath the power unit and securely bolted to it.

Note: Immediately following this specification include specification for Electrical Equipment.

Erection

13. All operating devices shall be erected and adjusted to proper working order by the window contractor.

Painting

14. All operating devices shall have one coat of manufacturer's standard, dark gray paint, oven dried and applied before shipment.

Note: The following should be provided for in the paint specifications. One coat of red lead and oil should be applied after erection, followed by one or more coats of finishing paint as required.

SPECIFICATION FOR ELECTRICAL EQUIPMENT

Work Included

1. The Operating Device manufacturer shall furnish wiring diagram and complete electrical equipment for Pond Operating Device as hereinafter specified.

Note: All Pond Operating Devices electrically operated should be accurately listed and located either on schedules on plans or in specifications. If more than one type be desired each type should be listed separately or otherwise clearly designated.

Electrical Equipment

2. **Motors**—Motors shall be of type best adapted to the power equipment, of high torque and ample horsepower.

Note: The motors for Pond Operating Device operate on A. C., 220 or 440 volts, 60 cycle, 3-phase, and are especially wound for high starting torque. They are furnished from stock, which avoids delay. Motors with other current characteristics require from four to six months to deliver.

3. **Power Connections**—Motors shall be connected to power by means of sprockets and silent chains.

4. **Reversing Switches**—Standard Magnetic Reversing Switches shall be enclosed in steel boxes and so designed, that the movement of the ventilator either in opening or closing may be stopped or started at any point by manipulation of push buttons.

5. **Limit Switches**—Limit Switches shall be positive in action and rigidly attached to the power to form an integral part of the power unit. All limit switches shall be enclosed yet accessible for adjustment so as to positively limit the motion of the ventilator in either direction.

6. **Push Button Stations**—Push Button Stations "open," "close" and "stop" shall be of rugged construction to withstand hard usage. Buttons shall be recessed in cover so that they cannot be accidently operated.

Electrical Construction

Note: The following provisions should be made in the Electrical Specifications.

The Electrical Contractor shall install magnetic reversing switches and push button stations and shall furnish and install safety type, line switches. He shall also furnish all conduit, fittings and wire and do all wiring in accordance with the wiring diagram between the Electrical Equipment furnished by the Window Operator Manufacturer and that furnished by himself. All materials and workmanship shall meet the requirements of the National Electric Code and all Local and State Inspection Bureaus.

Conduit shall be galvanized or black enameled, approved by Underwriter's Laboratories, Inc. Wire shall be rubber covered N. E. C. Exposed conduit shall be run in a systematic, sightly manner, paralleled with structural features of the building and rigidly and neatly secured. Where walls are plastered conduit shall be concealed.

The Electrical Contractor shall carry fire, workmen's compensation, and public liability insurance. He shall guarantee his work for a period of one year after completion. Defects in the work and material furnished by him developing during the above named period shall be promptly and satisfactorily made good at his expense.

LUPTON COMMERCIAL STEEL DOORS

Lupton Commercial Steel Doors are designed for use in private and public garages, manufacturing plants and similar buildings, where inexpensive steel doors are desirable. Stiles and rails are made of 18 gauge steel plate with the corners welded. The lower panel is 16 gauge steel plate and the upper section is arranged for glazing. Two types of doors are available, hinged and sliding. Details and sizes are shown on pages 60-61.

Frames—Are furnished for hinged doors only and only when specified on order. Specify by mark number given in table.

Hardware—Hinges for hinged doors and tracks and hangers for sliding doors are furnished with the doors. All other hardware must be specified by number on order if wanted.

Drilling, etc.—Hinged doors are drilled for hinges and when mortised lock No. 97 is ordered the doors are mortised and drilled to receive it. All other drilling must be done in the field.

Shipping—Single doors with frames are shipped assembled in the frames. Double doors are shipped separately from frames.

Glass—Glass sizes are given in the table. Orders for doors do not include glass, but we furnish the necessary glazing members. Glazing should be done after the doors are erected.

When Ordering—Give the symbol numbers and quantities of units required and indicate whether hinged or sliding. If hinged doors are ordered indicate swing of door (see sketch on page 61). If frames are required give symbol number and quantities. Specify the symbol numbers of hardware required and we will furnish the proper quantity to fill out the order. See list and illustrations on this page. When ordering top and bottom bolts be sure that right keeper is selected.

Hardware List

Following is a list of hardware which can be furnished on order. See illustrations on this page. Specify items by the numbers.

For Hinged Doors

No. 97 Mortise Lock.
No. 98 Lever Latch and Padlock Bracket.
No. 99 Offset Hinge.
No. 100 Top and Bottom Bolt Assembly.
No. 101 Hook-Back and Ring Assembly.

For Sliding Doors

No. 102 Track Bracket.
No. 103 Track, 6′, 8′, or 10′ long.
No. 104 Trolley Bracket.
No. 105 Trolley.
No. 106 Stay Roller.
No. 107 Center Guide and Stop.
No. 108 Door Stop
No. 109 Inside Handle.
No. 110 Outside Handle.
No. 111 Hasp and Staple.

LUPTON ROLLED STEEL SKYLIGHT

Lupton Rolled Steel Skylight is especially adapted to conditions of unusual severity such as vibration, wide range of temperatures, and inaccessibility for painting.

Its patented construction eliminates breakage of glass due to expansion and contraction, and to vibration. Leakage, due to drying of putty, rapid deterioration by corrosion and collection of dust by condensation gutters are all eliminated by the Lupton Skylight.

The glass is supported between flexible strands of specially saturated fibre. This permits free expansion and contraction, without leakage, since no putty is used.

Erection of Lupton Skylight involves no cutting and fitting. All members are cut to exact size, the bars and caps are offset at the factory, and all parts are shipped ready for assembling. Erection can be done by ordinary mechanics.

SPECIFICATION FOR LUPTON ROLLED STEEL SKYLIGHT

Work Included

1. Furnish and install where shown on drawings Lupton Rolled Steel Skylight manufactured by David Lupton's Sons Company, Philadelphia, Pa.

Note: Lupton Rolled Steel Skylight should be accurately listed and located either in schedules on plans or in specifications. If more than one type of Skylight be desired, each type should be separately listed and located or otherwise clearly designated. These details assure greater accuracy in estimates.

Shop Drawings

2. Submit in triplicate for the architect's approval complete shop drawings. These shall show scaled details of construction, anchoring, etc.

Materials

3. Skylight Bar shall be a specially rolled solid, one-piece, U-shaped steel section.

4. The cap shall be specially formed of 16 oz. cold rolled copper. Studs shall be of malleable iron passing through the cap to receive brass dome nuts.

5. Curb Aprons of 16 oz. cold rolled copper shall be furnished.

Note: Caps or curb aprons or both will be furnished in 24 gauge galvanized steel at a corresponding price when specified.

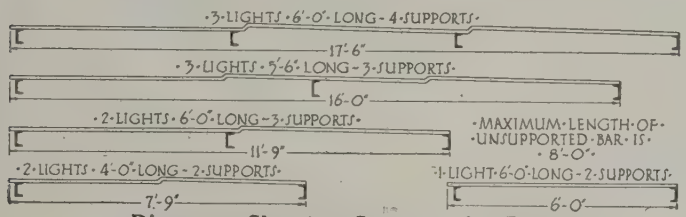
6. Clips, anchors, bolts and screws for attaching the skylight to the building construction shall be furnished as required.

Note: (a) Anchors are not set in the masonry by the skylight contractor.

(b) Structural steel is not furnished by the skylight manufacturer.

Construction

7. Skylight Bars and Caps shall be cut to the proper lengths ready for assembly in the field.



Diagrams Showing Supports for Bars
Maximum unsupported length of bar is 8' 0"

Erection

8. Lupton Rolled Steel Skylight shall be erected in prepared openings by the skylight contractor (unless otherwise specified) in accordance with the standard details for this product.

Note: (a) Include in the masonry specification that openings for skylights be prepared according to the standard details for Lupton Rolled Steel Skylight. Anchor clips must be imbedded in the masonry as shown in details.

(b) Include in the structural steel specification that all punching for clips, etc., required for the installation of Lupton Rolled Steel Skylight must be done by the Steel contractor.

9. The glass shall be supported longitudinally on saturated cords of specially treated fibre resting in the flanges of the skylight bars.

Where two sheets of glass overlap, they shall be separated by saturated cords. The caps shall be separated from the glass by saturated cord and held in place by the studs and cap nuts.

10. Curbs, hips and ridges shall be calked with roofing cement and flashing shall be applied at hips and ridges as indicated on the details for Lupton Rolled Steel Skylight.

Painting

11. All skylight bars shall receive one coat of red lead primer on the outside and one coat of asphaltum on the inside before shipment.

Glass

Note: Specify the following under the proper heading in Specifications of other trades.

(a) ¼" thick ribbed wire glass or ¼" thick rough wire glass. No single sheet to exceed 6' in length.

LENGTHS OF BARS FOR VARIOUS LENGTHS OF GLASS

Length of glass, ft. in.	Lengths of bars					
	1 light, ft. in.	2 lights, ft. in.	3 lights, ft. in.	4 lights, ft. in.	5 lights, ft. in.	6 lights, ft. in.
3 0	3 0	5 9	8 6	11 3	14 0	16 9
3 6	3 6	6 9	10 0	13 3	16 6	19 9

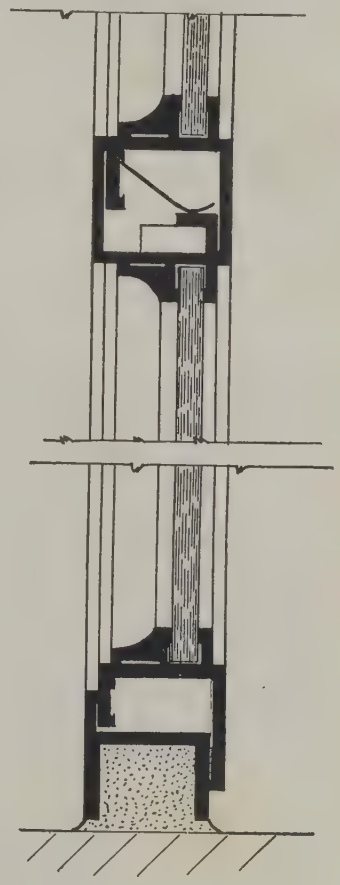
PYRAMID BRONZE CASEMENTS (patents pending).

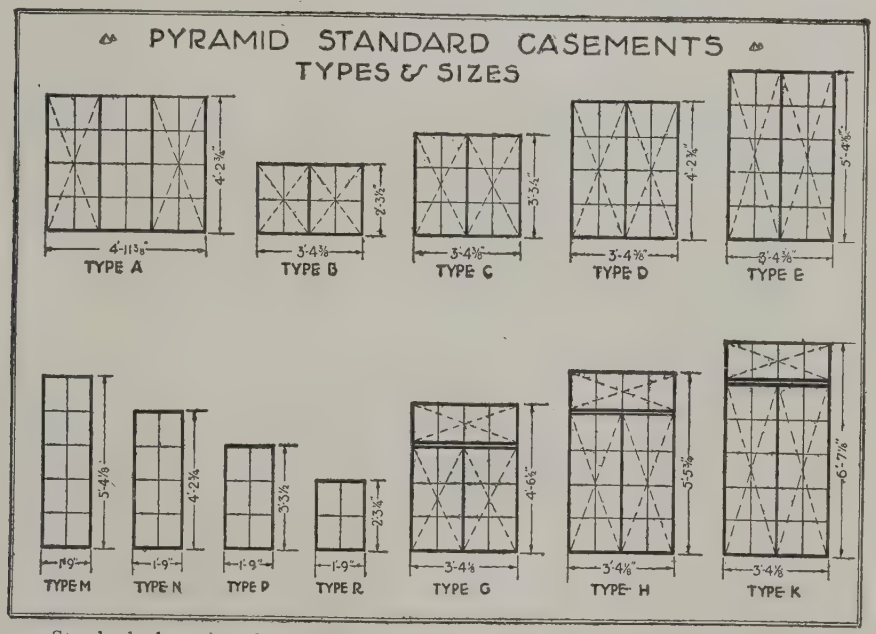
For Pyramid Bronze Doors, see pages A964-966.

Pyramid Bronze Sash

Pyramid Bronze Sash with its three points of weathering creates a new standard in casement sash. It is adaptable to all types of buildings. This construction, though new, has proven decidedly efficient. The third point of weathering must not be confused with ordinary added weatherstrip. It is a continuous flexible phosphor bronze spring member concealed and fastended in a dovetailed groove insuring absolute protection under all conditions. Pyramid Sash are assembled from our standard extruded bronze members from which we are able to build up many different styles and forms. This type of construction though very economical, creates a sash of unrivalled appearance with unbroken architectural lines both inside and weatherside.

The extruded members are of generous and sturdy cross section, interlocking to form an absolutely rigid sash that is really weatherproof and will remain so for an indefinite time. The glass mould and frame mould are applied in a novel manner, concealing and permanently retaining all putty, and corners are mortised and tenoned together, being automatically tightened and made waterproof by a concealed driven keyed taper. No nuts nor bolt or screw heads exposed. Prices and literature on application.





Standard glass sizes 9x12 used. These units supplied without glass stops or glazing. Glass stops will be furnished at slight additional cost.

LEMCO HIGH GRADE STEEL CASEMENTS AND DOORS FOR EVERY PURPOSE

Types of Lemco Steel Casements and Doors

We specialize in high grade steel casements of any design or size. Our casements and doors may be divided into two general groups.

Strictly Custom Built Casements and Doors—These are made of No. 200 heavy three-point section and No. 600 heavy two-point section. They may be of any shape or size.

Standardized Steel Casements and Doors—The casements are made of No. 700 medium two-point section and No. 100 standard two-point section. The doors are made only of No. 600 two-point section.

Lemco Casements Produced on a Quality Basis

Our casements are produced to conform to a high standard of both workmanship and material. The sections, which are unusually heavy, are made from hot rolled steel bars and are carefully straightened. The corners are accurately mitered and electrically welded together, making strong and neatly finished casements.

They are made by expert mechanics and all work is subjected to rigid inspection for precision of contact parts and assembly. The hardware, including hinges and fasteners, is made of bronze and not of malleable iron.

Lemco Hardware All Solid Bronze

All hardware is solid bronze, even for the most inexpensive sash, and is made in our own foundry. Plate 1H-1 shows the design of the various parts.

Our patented safety cleaning friction hinge allows the outside of the glass to be cleaned from the room side and the friction feature does away with the use of a sill adjuster. The friction hinge is easily operated, yet it will hold the sash in any desired position.

How the Casements Are Finished

All steel is thoroughly cleaned and brushed before painting. All custom built jobs receive one coat of rust resisting paint and one coat of gray enamel, each coat baked on separately; standardized casements receive only one coat of gray enamel. However, painting specifications may vary to meet conditions or architect's specification.

LEMCO HIGH GRADE CUSTOM BUILT STEEL CASEMENTS AND DOORS

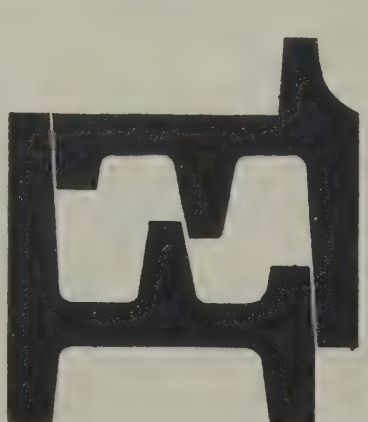
No. 200 Heavy Three-point Section

This section is for use where the heaviest, high grade casement having unusual strength is desired. It has two weathering points and an additional baffle rib in the center which breaks up any air currents which may pass the outer contact point. This baffle rib also adds to the strength of the frame and sash. This type section is suitable for the highest grade work as well as for very large sash and door.

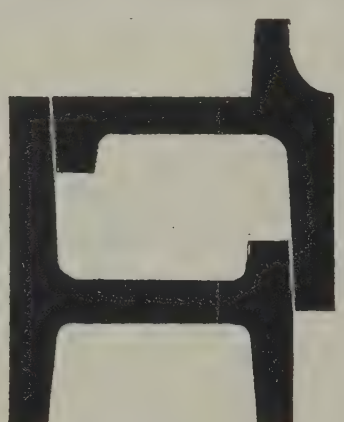
No. 600 Heavy Two-point section

For use where a high grade weathertight two-point casement is desired at a lower cost than the heavy three-point casement. This section is lighter than the No. 200 and there is no center baffle rib.

Sections 200 and 600 are only made in special sizes.



No. 200 Heavy Three-point Section
For finest work and for large windows



No. 600 Heavy Two-point Section
At a minimum cost

Special Custom Built Doors Opening In or Out

These can be made with either the No. 200 heavy three-point section or the No. 600 heavy two-point section. They can be of any shape or size and are made to architect's details.

Continued on next page

THE STANDARDIZED STEEL CASEMENTS AND DOORS

These are made in standard sizes but are unusually heavy for this size sash. They can be made to special size at a slightly higher price. They are of two types, No. 700 and No. 100. Both are made in the small standard sizes two lights wide as shown in the schedule on Plate 1D-1.

No. 700 Medium Two-point Section

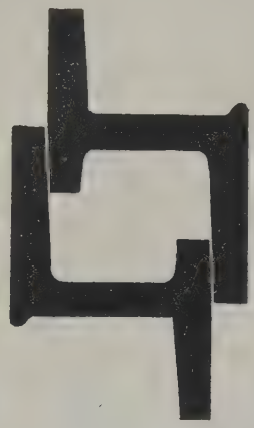
This type has the heavier frame section in that it has two legs of the same length which rest against the masonry opening. This gives a better chance to secure the frame to the masonry by means of expansion bolts or screws in lead sleeves, as it requires a deeper rabbet in the stone. This also lessens the danger of chipping the stone rabbet when being screwed into place.

Using this section prevents any twisting of the frame while installing on account of the extra weight of the frame section.

The No. 700 type section costs slightly more than the No. 100 type section on account of the difference in weight.

No. 700 Medium Two Point Section

A high grade sash made in standard sizes. Especially adapted for use with stone trim



No. 100 Standard Two Point Section

A heavy, inexpensive, cottage type casement made in standard sizes

No. 100 Standard Two-point Section

For use where a good substantial steel casement at a low price is desired. The casement is made in standard sizes still maintaining our high quality and workmanship.

Standardized Steel Doors

The frames for these doors have the No. 600 heavy two-point section described on preceding page. This makes a strong, rigid frame to withstand hard use and the deep rabbet provides ample room for securely anchoring the frame to the masonry.

When Leaded Glass Is Desired

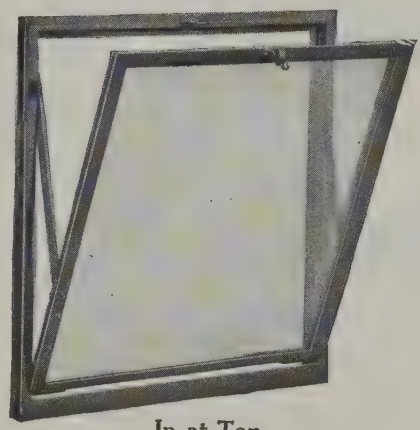
Any of our sash, either special or standard, can be supplied without steel muntin bars when it is desired to use leaded glass. On account of the extra weight and strength of our sections, they lend themselves very well to this method of glazing.

THE NEW LEMCO PROJECTED WINDOWS—IN AT TOP OR OUT AT BOTTOM

In the new Lemco Projected Sash we offer a projected sash of the very highest grade. It is made in the No. 600 two-point section and is stiff enough not to twist even in large sash. All the sections are carefully straightened, so as to produce a close contact and provide a weatherproof construction.

Made in Two Styles

The sash is made in two styles, to open in at the top or out at the bottom. Each of these have their own particular uses. They have the advantage of allowing a considerable amount of ventilation before the sash is really opened. This enables the user to secure ventilation and yet not let in the weather.



In at Top

Adjustable Bronze Friction Pivots and Hardware

All the hardware on the sash is of bronze to insure long life and easy action.

The pivot is so arranged that it is readily adjustable at any time to secure the proper amount of friction in order to operate the sash freely yet have enough friction to hold it in any position.

LEMCO
STANDARDIZED STEEL CASEMENTS

In the manufacture of our Standardized Cottage Casements we have had in mind quality rather than price We recognize that windows which lack sturdiness and rigidity are a source of continuous annoyance and dissatisfaction. To that end our sections No. 100 and No. 700 have been designed sufficiently heavy to sustain the weight of glass

which cheaper and lighter casements fail to do They are equipped with our substantial patented solid bronze cleaning hinge which prevents sagging and insures weather tightness.

The same standard of workmanship and quality of material are required in the fabrication of our cottage casements as in our custom work. They combine permanent serviceability with ornamental value.

Solid Section Steel Sash, Cruciform Industrial, Center Pivoted Type

Construction—The heavy Cruciform Sash bar weighs in excess of 1 lb. per ft. It is of ⅛-in. stock and 1 in. wide by 1½ in. deep.

Welding—Every joint of the Mesker Sash is arc-welded. Muntin bars running the shorter dimension of the Sash are in one piece—no cut outs. This gives maximum strength and stiffness to the sash.

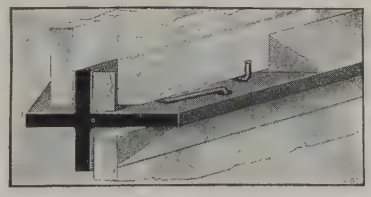
Weathering—A ⅜-in. continuous flat surface weathering contact is maintained on four sides of the ventilator opening. Double contact or metal weather-stripping is furnished when required.

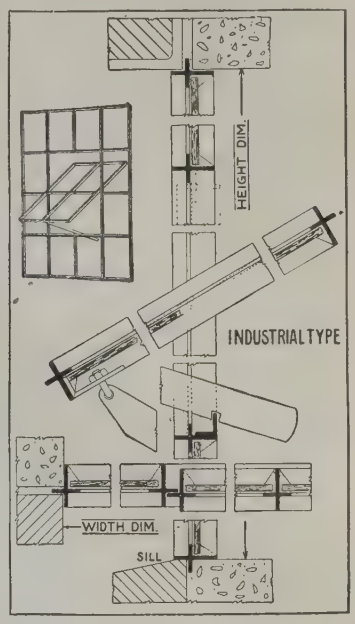
Standard Pivots—Are simple in construction. Highest satisfaction has marked the many years of their use.

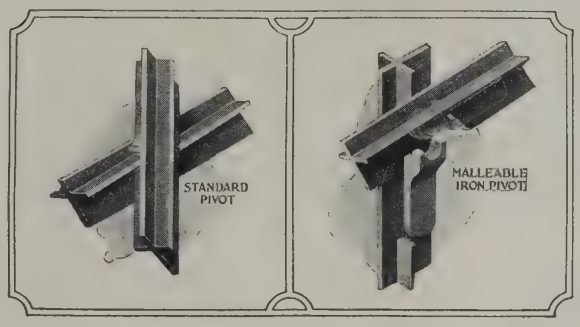
Malleable Iron Pivots—Are furnished when required. These are similar in action to the standard pivot. Both kinds permit the ventilators to be removed for glazing or cleaning.

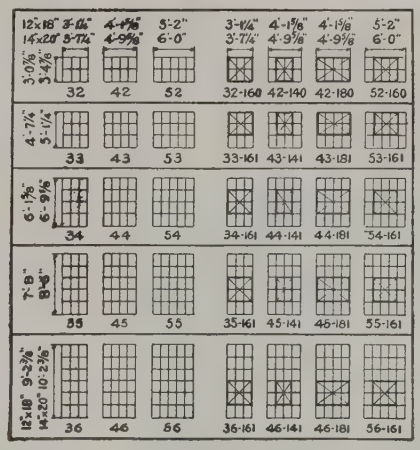
Glazing—The Cruciform type bar permits outside or inside glazing or both. With outside glazing the metal is protected from the weather by the putty, and frequent painting is unnecessary.

Underwriters' Labeled—Labeled sash is furnished in above construction, plus steel glazing angles for holding the glass.









Standard Sizes and Details Industrial Sash

Solid Section Steel Sash, Cruciform Architectural, Reversible Extending Type

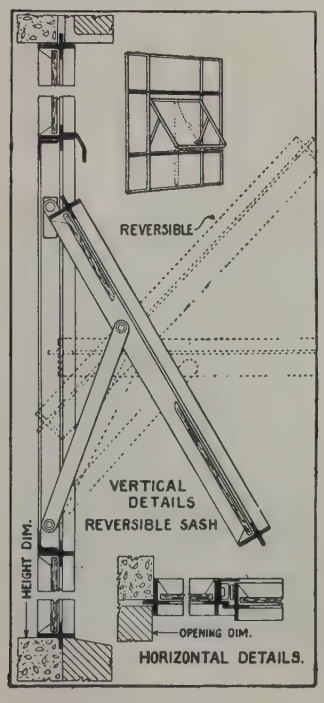
Utility—Adapted especially for schools, offices, hotels, hospitals and apartments. The ventilator in this type of window is balanced upon two pivoted arms. It extends out at the bottom and is completely reversible. When tilted at a given angle the ventilator serves as an awning and may be kept open through light winds or rain; while admitting air, it protects the interior of the room.

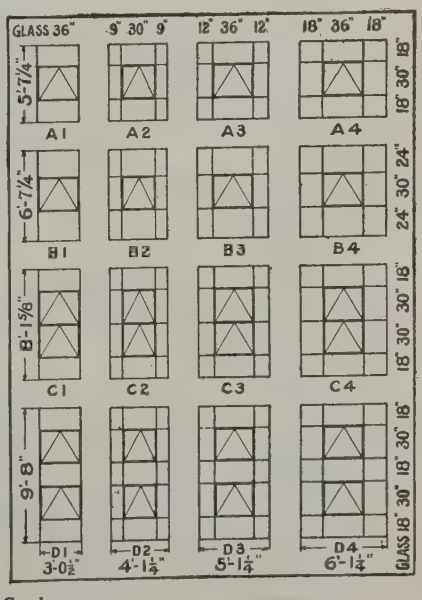
Brick Raggle—The raggle or brick groove in the window jamb is entirely covered by the wide surface of the Cruciform frame bar. It eliminates the necessity of pointing, in most cases.

Double Contact Weathering—Double contact weathering is employed in extending type windows on all sides of the ventilator opening.

Weatherstrips—Patent spring bronze weatherstrip is furnished only when specified. It assures absolute tightness, is wind and dustproof, and prevents rattle.

Welding—As in the industrial type, the extending type sash are electrically welded. There are no cut outs to weaken the sash at intersections of muntin bars and the full strength of the sections is retained in the sash.





Details, Installation and Sizes of Architectural Reversible Sash

Continued on next page

Hollow Metal Windows

Are made in all types including Double Hung, Counter-balanced, Pivoted, Casement and Stationary. Approved by the National Board of Fire Underwriters and suitable for new or old buildings. Designed along the same lines and contain the same glass area as wood windows. Frames and sash of No. 24 gauge, galvanized steel or 20-oz. copper. Concreting of subsills must be done at building. Underwriters' label is a guarantee that windows comply with every requirement, and are accepted everywhere by rating bureaus as standard.

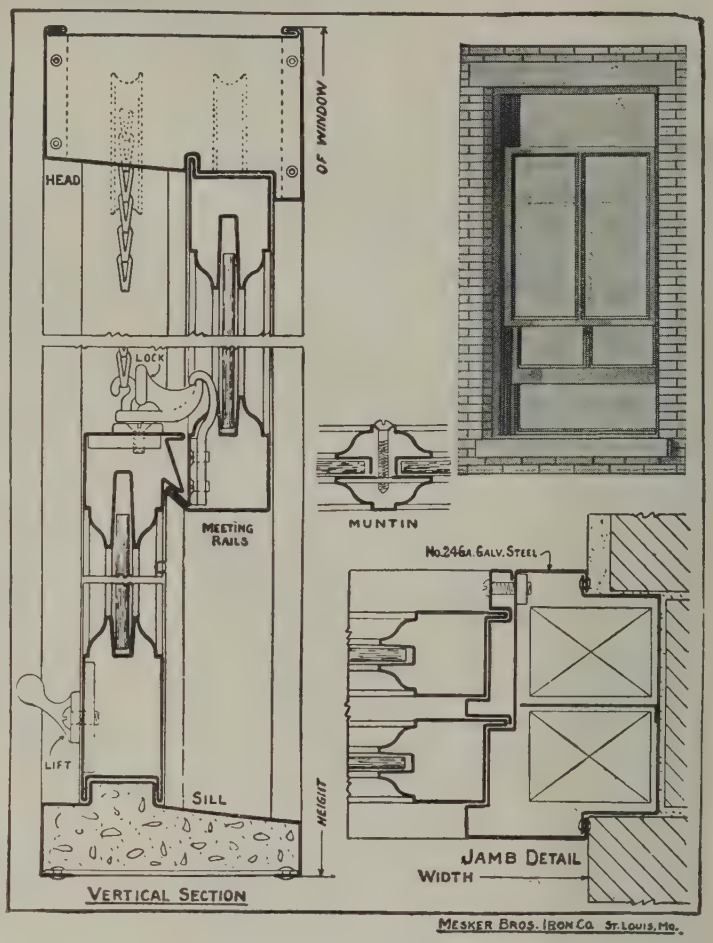
The hanging or the removal of the sash is accomplished as easily as in wood windows; an important factor in cost.

Glass must not exceed 720 sq. in. exposed area per light, and no longer than 54 in., except for windows in street elevations where such light is limited to 2916 sq. in. These windows may be made single or in multiples of two or more, to accommodate large lighting areas.

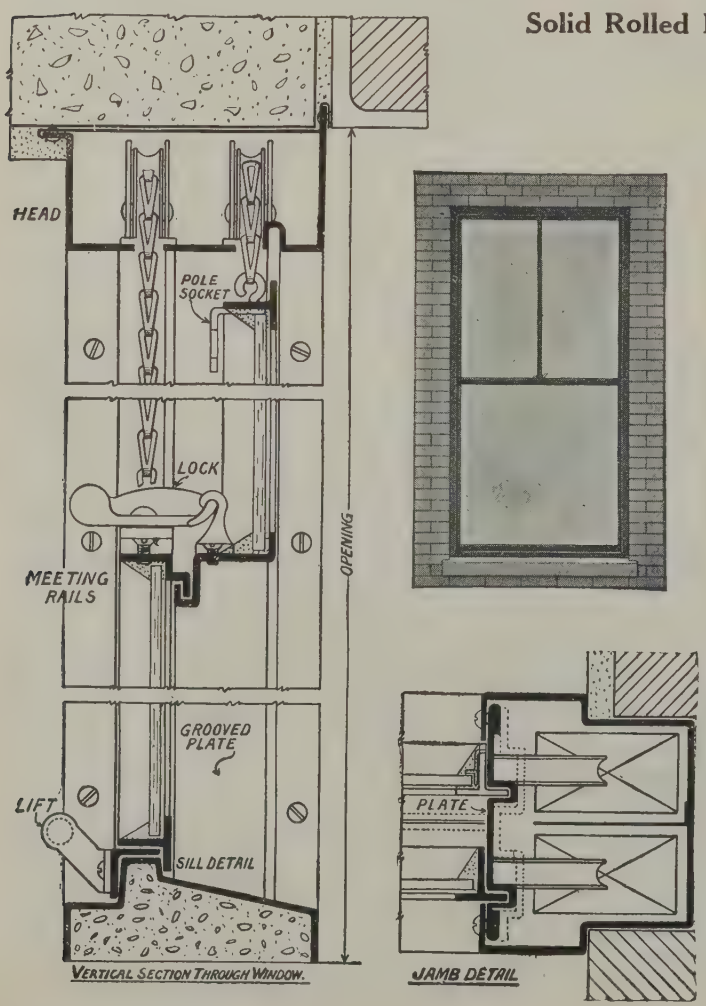
Transoms may be used over all windows or multiples either hinged, pivoted or stationary.

Transom bars are all sheet metal for windows 10 ft. high or under.

Foswin Arms Hotel, Chicago, Ill.
Midland Construction Co., Contractor



Solid Rolled Metal Windows



Double Hung—Frames are made of No. 16 gauge or heavier, blue annealed steel, or No. 24 galvanized steel, or from 18 to 48-oz. copper.

Sash are of solid rolled steel or bronze of No. 10 gauge.

They are suspended to heavy metal chains which pass over pulleys in the window head and fastened to weights in the jambs.

Access to weight box is obtained by removing the lower grooved plates in the jambs.

Large lights of glass is permitted in non-labeled windows secured in place by steel glazing clips and putty.

Underwriters' Labeled Windows—Have frames not lighter than No. 15 gauge blue annealed, or No. 24 gauge galvanized, steel.

Sash are of No. 10 solid rolled steel. The glass is held by special steel glazing angles.

Counterbalanced Windows—Are made of same material as double hung. They have no sash weights but the two sash are balanced and supported by chains running over pulleys in the window head. The sash opens at the head and sill simultaneously.

They are absolutely waterproof.

Burch Hotel, Breckenridge, Tex.

ESTABLISHED 1884

THE PHILADELPHIA SUPPLIES CO., INC.

SUCCESSORS TO P. DEISSLER & BRO.

All-metal Window Frames and Pivoted Window Ventilators

1741 North Sixth Street
PHILADELPHIA, PA.

Products

Sole manufacturers of the P. Deissler & Bro. patented PIVOTED VENTILATORS.

METAL FRAMES for church windows and the leaded glass trade.

BASEMENT WINDOW VENTILATORS for masonry or wood construction.

Also Skylights, Domes, and all other kinds of wrought iron work used in the leaded glass trade.

Improved Type All-metal Built-in Window Frames

Frames are made of steel or wrought iron as desired. They are built in as the building is in course of construction and make a rigid and everlasting weatherproof job. They are made in all styles—square, round or gothic top, and in any size or weight material desired. Used for leaded, plate, wire, ribbed or prism glass. Finish is either painted or galvanized.

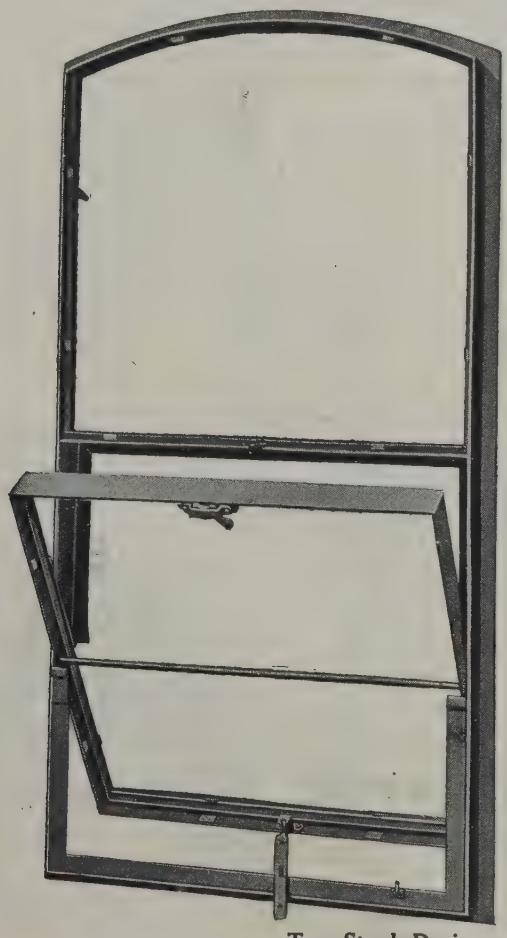
Frames are made for storm glass outside and leaded glass inside or for single glazing.

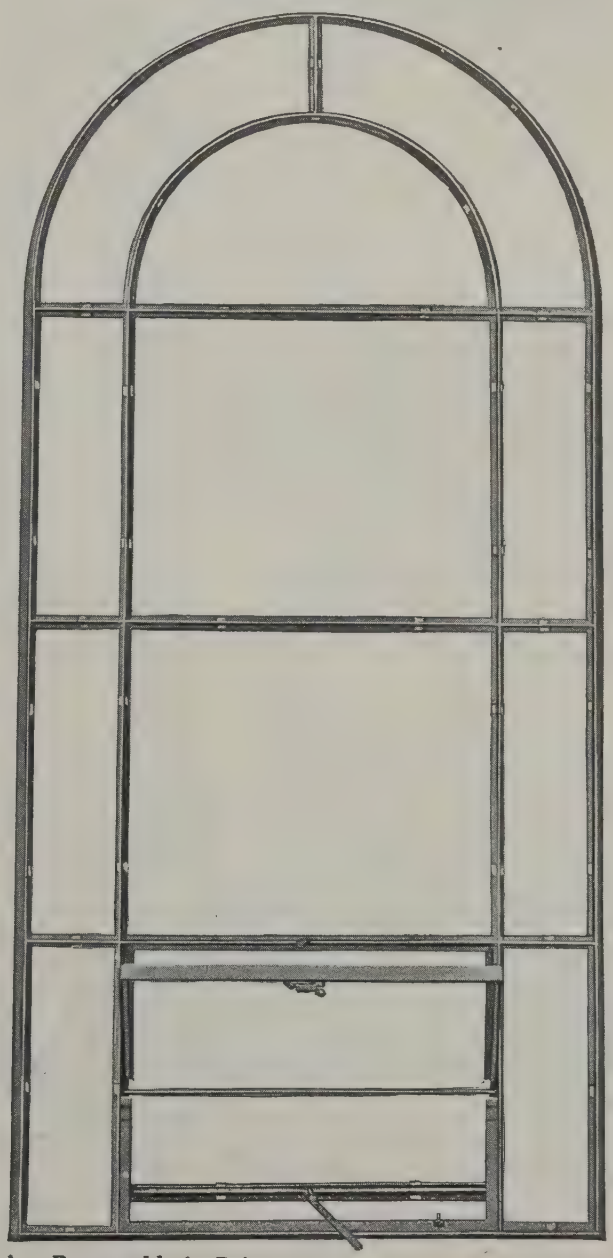
Ventilators can be put in the top, center or bottom of frames, and the inside swinging frames can be removed for glazing.

"Deissler" Improved Pivoted Ventilators

These ventilators have been specified for over 40 years as the standard church window ventilator. They are made of steel or wrought iron angles for single or double glazing and can be used for leaded, plate, wire, ribbed or prism glass. The inside frame of ventilators can be taken out and bars put in to suit the design. Finish is either painted or galvanized.

Where ventilators are in reach they are provided with spring lock at the top and lug at the bottom with strap for adjusting extent of opening. Ventilators out of reach should be specified with bottom heavy, self-closing; these are for the intermediate and bottom sections of windows. They are equipped with lock, pulley, bracket and chain fastener attached to the ventilator and are operated from the side with a chain. This eliminates the objection of cords or chains obstructing the design or view of the window.





Two Stock Designs of Frames That Are Reasonable in Price

We also make special designed metal frames—any style, size or weight material desired

Continued on next page

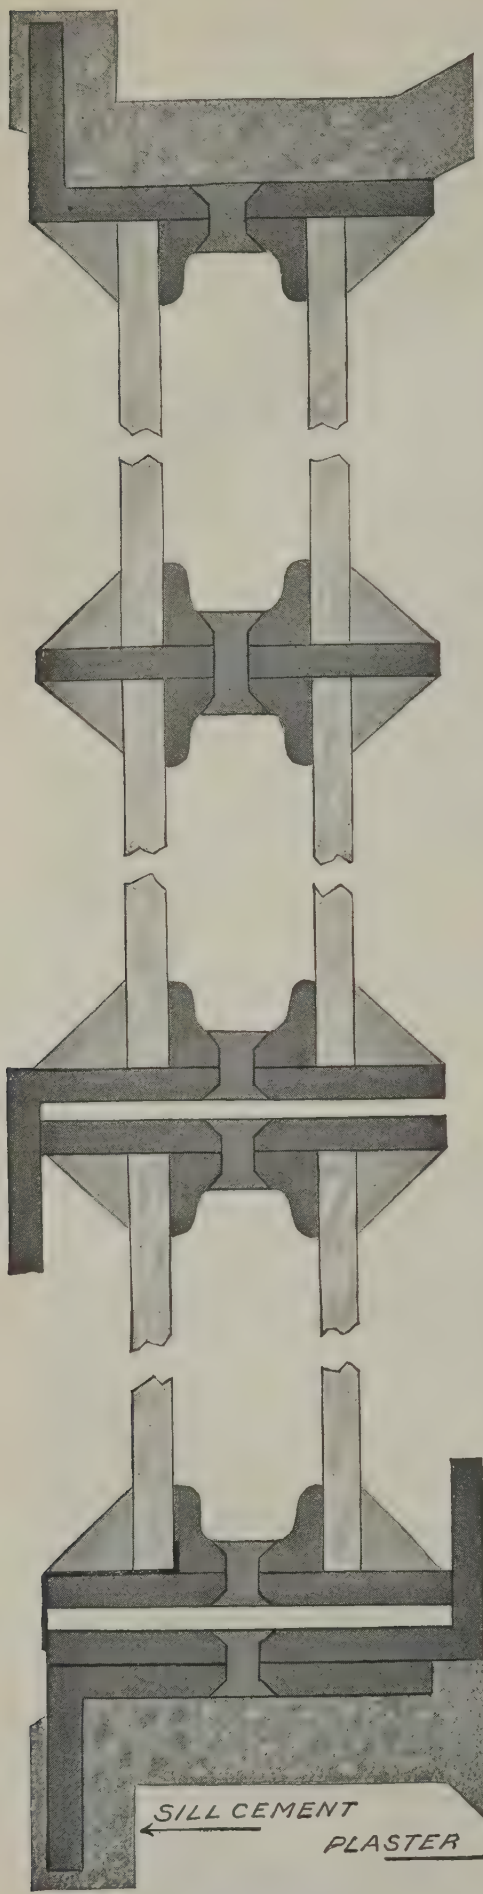


Fig. 1—Sectional View
(Full size)

Fig. 1. Sectional View (Full Size)

Illustrates a section of a metal frame for outside storm sash and inside leaded glass glazing. The double, double bottom ventilator shown is pivoted in the center to swing in at the top. Specify Catalogue No. 10 for double bottom ventilators where operation of sash is by spring lock at top and adjusting lug at the bottom; for the bottom heavy self-closing type adjusted by chain at the side specify Catalogue No. 38.

Fig. 2. Sectional View (Full Size)

Illustrates a section of a Te-iron metal frame for single glazing. Type illustrated is for building into masonry openings but it can be made with angle iron all around and screwed into rough wood openings. Can also be used where wooden frames have a rabbet in which case the angle iron on the outside is not required as the frames have turned ends on the mullion bars which can be screwed direct to the wood.

The ventilator is also for single glazing and pivoted in the center to swing in at the top.

Specify Catalogue No. 1 ventilator for the bottom; No. 2 for the middle, and No. 3 for the top. Hardware can be furnished the same as described for the Nos. 10 and 38 Double, Double Bottom Ventilators described above.

Information Required for Estimates

All-metal Window Frames—Send blue prints and specifications with list of bidders. Any charge for these will be gladly remitted.

Pivoted Window Ventilators—The quality of ventilators and style wanted; and if for leaded glass, give bar sizes.

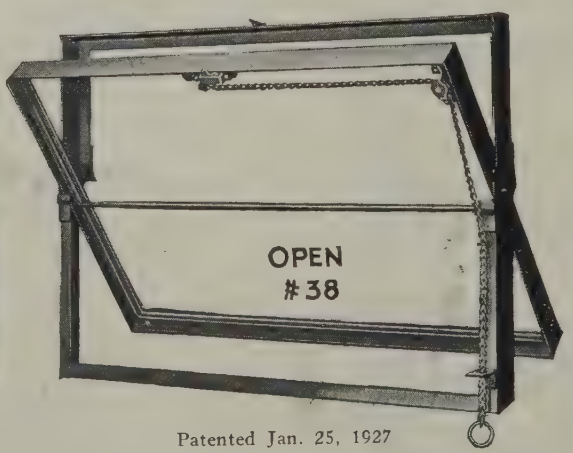
The sizes should be taken from the outside of angle iron, giving the width first, then the height. For rabbeted work, sizes should be taken full size.

In grooved mullions or jambs, the sizes should be taken daylight size.

State if ventilators are to be placed in top, middle or bottom of window, and if they fit in wood all around; and, also, if they are to be painted or galvanized.

For domes, skylights or iron work, send sketches.

Sizes, shapes and quantities vary so considerably, that it is impossible for us to issue a reliable price list. We will be glad to prepare a special estimate on receipt of specifications and quantities.



Patented Jan. 25, 1927

No. 38 Bottom Heavy Self-closing Ventilator

Fully Weatherproof, All-metal Basement Window Ventilators for Masonry and Wood Construction

These ventilators have many advantages over the old style as they make a permanent, weatherproof job and have no hinges to get out of order. They have a spring snap catch at the top and pivot at the bottom (see sectional views).

These ventilators are made for single or double glazing and pane glazing.

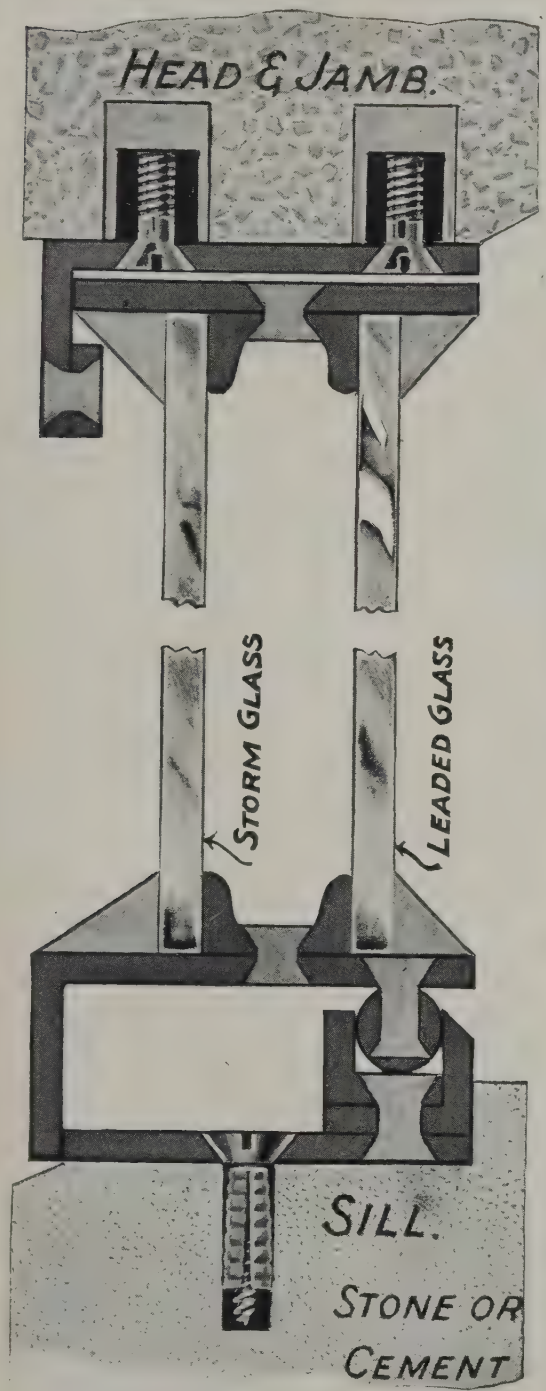
When specifying steel basement windows notify us, sending us the necessary blue prints, specifications, and list of bidders and we will remit any set charge for same.

No. 36 Basement Window Ventilator—Substantially made with horizontal stiffening bars. Extension arms which hold ventilators open ride through slotted frame, and when ventilator is closed they fit snugly into the frame.

Equipped with brass lock and made for leaded glass.

No. 37 Basement Window Ventilator—This frame is constructed on the same principle as the No. 36 for opening and closing and is made for pane glazing.

Made for single or double glazing as shown in the sectional views below. Frames painted or galvanized.

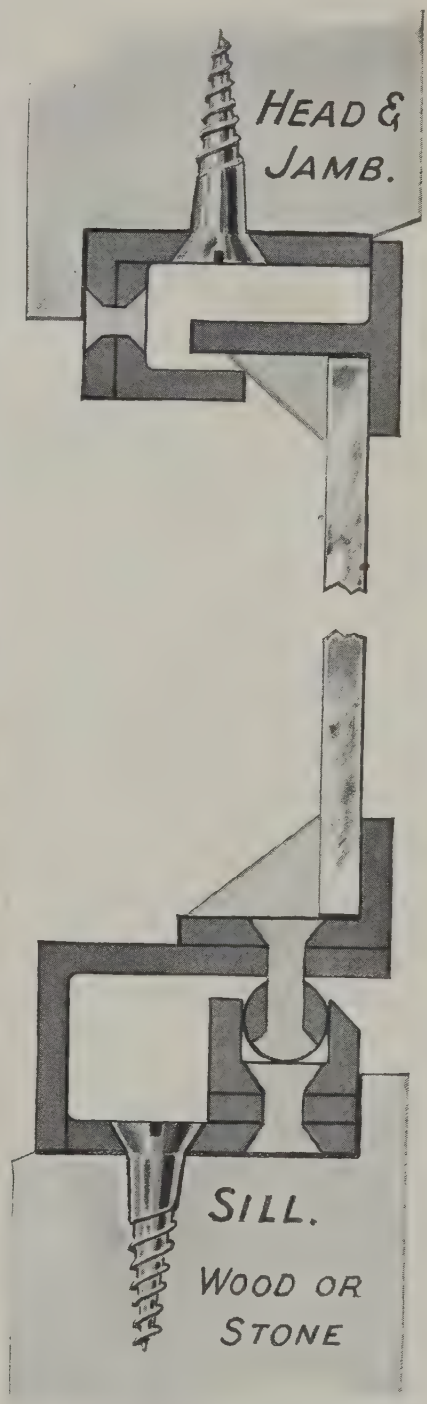


Full Size Sectional View Style No. 55

For Nos. 36 or 37 ventilators. For double glazing set in groove. Made for masonry construction only

No. 37 Ventilator for Pane Glazing

No. 36 has horizontal stiffening bars only and is made for leaded glass



Full Size Sectional View Style No. 54

For Nos. 36 or 37 ventilators. For leaded glass. Single glazing made to set in wood or stone.

For basement window for pane glazing, specify No. 53

Newman Bronze Windows

Architects all over the country are realizing more clearly the fact that bronze windows represent real economy because of their permanence. Newman Bronze Windows are being specified to a greater extent than ever before because they incorporate many distinctive advantages.

Outstanding Features of Newman Bronze Windows

(1) Absolute permanence.

(2) Watertight and airtight construction—reduces fuel costs.

(3) Require no maintenance attention—are foolproof and wearproof, completely eliminating upkeep cost.

(4) Possess beauty and dignity not matched by many kinds of material.

(5) Parting strips are removable over entire length, facilitating adjustment of sash or sash weights.

(6) Meeting rails are of two-point contact design.

(7) Ingenious construction permits inside setting, eliminating the necessity for scaffolding.

(8) Have no visible outside screws; all glazing is done from the inside.

Hardware

Standard types of cast bronze hardware are suitable for all window types.

Accessories

Windshields, heat screens and fly screens can be supplied on request.

Uses

Newman Bronze Windows are specifically designed for banks, public buildings, residences, churches, universities, office buildings, clubs, hospitals, theatres, etc.

A Pioneer Manufacturer of Metal Windows

The S. H. Pomeroy Co. Inc., was a pioneer manufacturer of metal windows. It has been engaged in perfecting window design and adaptability for over 30 years, during which time many prominent installations have been made. It now offers its—

"Superior Type" Heavy Metal Double Hung Window

Superior Metal—This window is made throughout of hot dipped galvanized copper-bearing steel. It is painted with a special galvanized iron primer made to our order.

Note: Committee A-5 American Society for Testing Materials:

"We have now reached a point where we may definitely conclude that copper-bearing metal shows marked superiority in rust-resisting properties as compared to non-copper-bearing metal of substantially the same general composition . . . under atmospheric exposure."

Superior Distribution of Metal—Structural and wearing portions of frame and sash of No. 14 and No. 18 gauge metal, viz.: sill, No. 14 gauge; pulley stiles, head and vertical rails of sash, No. 18 gauge; jamb boxes and cross rails of sash, No. 20 gauge.

Superior Weathering—Two-point contact inside and out entire perimeter of both sash, making double weathering.

Superior Light—Due to small sash and frame members, maximum sight glass area is obtained.

Width of standard muntin 1 in., Underwriters' muntin 1¾ in.

Superior Appearance—Compare the slender lines, the simplicity and dignity of design with other metal windows. Note the absence of rivet and screw heads, bolts, etc. All exposed screw heads on interior are countersunk.

Superior Economy—In the "Superior" window we offer to the building public, wherever located, a double hung metal window of unequaled merit and at a price so surprisingly close to wood windows that their use must now become universal.

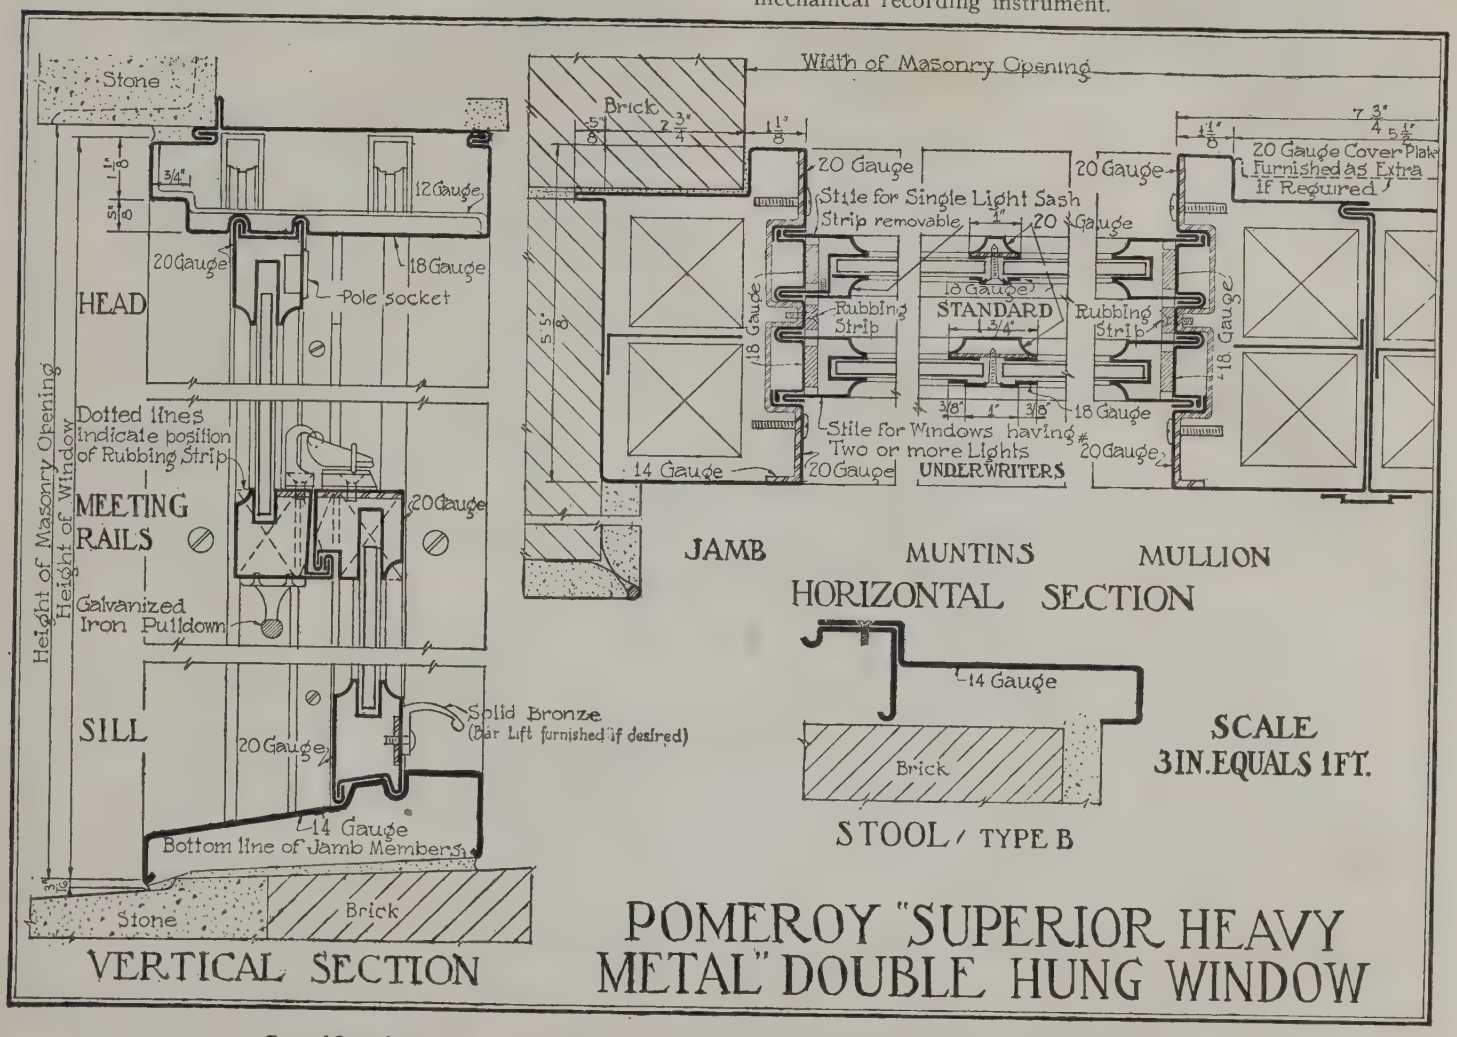
Air Infiltration

This window has been designed and constructed with the idea of insuring against excessive infiltration of air.

Subjected to test made at the University of Wisconsin by Professors Edward Anderson and G. C. Wilson, under the supervision of Professor G. L. Larson, in a manner similar to that described in the Journal of the American Society of Heating and Ventilating Engineers, June, 1924, the amount of infiltration of air through a standard double hung window proved to be less than two-thirds of a cubic foot of air per foot of sash perimeter per minute when subjected to static air pressure equivalent to air pressure exerted by a wind of twenty-five miles per hour.

This minimum amount of infiltration of air is accomplished without any added weatherstripping, device or appliance, with their additional cost.

This amount of air leakage is not discernable to a person standing on the room side of a window without the aid of a mechanical recording instrument.



Specification for "Superior" Type Heavy Metal Double Hung Window

Scope—Furnish and install, where shown on drawings, double hung windows of heavy metal "Superior" Type, as manufactured by S. H. Pomeroy Co., Inc., of New York City.

Material—All windows to be constructed throughout of copper-bearing hot dipped galvanized steel. Sills shall be of No. 14 gauge, jambs of No. 20 gauge, pulley stiles No. 18 gauge, heads No. 18 gauge, side rails of sash and inside muntin caps No. 18 gauge, cross rails of sash No. 20 gauge.

Frame Construction—Head, sill and jambs shall be constructed of one piece of metal, exclusive of pulley stiles and closure strips. All members shall be formed straight and true, neatly mitered, lapped and properly interlocked to their respective intersecting parts. Exterior hanging stile shall be flat and 1⅛ in. in width. The interior of jamb shall be flat and 3⅞ in. wide. The depth of frame from inside to outside of hanging stile shall be 6⅝ in. Pulley stiles shall be formed with deep weathering grooves and shall be removable to permit of access to weight boxes and pulleys, and held in position by flat head countersunk screws. These screws shall pass through heavy reinforcing plates spanning the inside of jamb box. With the exception of these screws no other screw heads, nuts, bolts or rivets shall appear on the inner face of the jamb or soffit of the head.

Sash Construction—Sash shall be moulded and of tubular design 1¼ in. thick. Side rails shall project not more than 1¼ in. beyond the inner face of the jamb, making the total distance from masonry jamb to sight line of glass 2½ in. Stiles and rails shall be constructed of one piece of metal moulded and neatly mitered, lapped and properly welded and interlocked. Side rails shall be of open construction with each flange being formed with a returned edge projecting into and operating in the weathering grooves of pulley stiles. Top and bottom sash rails shall be formed with flanges which shall engage in weathering grooves in the soffit of the head and those formed in the sill. Meeting rails shall not be more than 1¾ in. in depth and constructed with flanges forming interlocking contact. Glass rabbets in side and bottom rails shall be ¾ in. deep. Those occuring in top rails of upper and lower sash shall be 1⅜ in. deep. Where sash are to be glazed with one light of glass the side rails shall be constructed with removable inside glazing beads which shall be held in place with flat head countersunk machine screws.

Muntins—Exterior muntin bar shall be moulded and reinforced with No. 14 gauge steel lugs. Interior caps shall be flat and held in place by flat head countersunk machine screws passing through the reinforcing lug of the exterior member.

Hardware Equipment—Frames shall be equipped with solid steel bronze bushed pulleys, contained in Nos. 12 and 14 gauge steel housings. Sash shall be hung on substantial sherardized steel sash chain and properly counterbalanced by cast iron weights. Sash shall be equipped with one pair of solid moulded bronze lifts, one malleable iron plated sash lock and pole socket.

Painting—Frames and sash throughout shall be given one shop coat of manufacturer's special prepared metallic primer before delivery.

Note: If Underwriters' label is desired the following paragraph should be incorporated:

"Windows shall be constructed in accordance with the requirements of the National Board of Fire Underwriters and shall bear their label of approval, as well as the label of the manufacturer."

Note: If it is desired to construct this window of bronze or copper, please write for specification.

BROWNE FIREPROOF, WEATHERPROOF and DUSTPROOF WINDOWS.

Browne Windows

Browne windows are of solid steel, built on principles that produce positive results in operation and in overcoming air leakage. The windows may be in groups of one or more pair of sash as desired.

Also made in bronze and aluminum.

Browne Fire Windows—Same in general appearance, and bearing labels of Underwriters' Laboratories, Inc.

General Description

Frames and sash are of solid rolled steel. Sash are firmly hinged together to open (outwardly) and shut under symmetrical control of hinged arms attached to a stationary vertical bar. Arms are forged steel and afford absolutely rigid support. A simple catch lock fastens sash when window is closed.

Heavy felt weatherstripping is an integral part of the construction.

National Board of Fire Underwriters Building, New York, N. Y.
CLINTON & RUSSELL, WELLS, HOLTON & GEORGE, Architects
JAMES STEWART & Co., Builders

Every window is assembled at factory, tested for accuracy and shipped a complete unit including hardware and weatherstrips. Browne windows require no special skill for setting and are readily glazed after installation.

Glass—Should be furnished and set by glazing contractor and may be of grade or type desired.

Painting—All metal parts receive one shop coat of paint before shipment.

All finishing coats should be applied by the painting contractor.

Advantages

Maximum Light and Vision—Sash are continuous from sill to head with no obstruction from horizontal meeting rails.

Ventilation—Ideal changing of air without drafts. The sash control forms flue that draws out all impure air, which is automatically replaced with fresh air. A pleasant quality of ventilation is obtained by bowing sash open to extent of catch hook attached to center upright. This gives fresh air intake at bottom, exhaust at top, with no opening at sides.

Weather Protection—The airtight and dustproof qualities of the windows have been established under laboratory test of 140-mile wind velocity.

Noiseproof—Thick felt contact cushions practically shut out street noises when window is closed.

Safety—All parts of the sash are accessible from the inside. The expense and danger of outside window cleaning and painting are eliminated.

Simplicity—No track mechanism for the accumulation of dirt and water. No weight boxes to invite drafts and annoyance from noise; no chains, weights or pulleys to get out of order; no rattling of parts when open or closed.

Contact—No metal to metal weathering contact. The contact in all cases is metal to felt.

Service—Continuous and lasting, with no danger of sagging, warping, racking, or wearing off paint.

Operation—Smooth, easy, noiseless; without physical effort the sash may be opened to any desired angle. Releasing catch handle, pushing sash partly open and a slight pull at the edges of sash towards center opens window full extent. Pushing edges of sash away from center brings handle within easy reach for closing and locking. The handle is a most convenient latch attachment and is intended for this use only. Where windows can not be reached from the floor, our standard operator may be applied, locking the window in any position.

Strength—All parts are sturdy and substantial; the greatest care is taken in the construction and assembling to insure rigidity and permanence.

Curtains, etc.—Curtains, shades, Venetian blinds, and inside screens may be applied as for ordinary sash.

Economy—Minimum cleaning and maintenance costs; assurance of maximum results from heating arrangements; and fuel saving due to dependably tight openings are prominent features.

Hardware—Furnished by us with the window.

STEVENS UNIT CASEMENT WINDOWS and SCREENS.
CASEMENT WINDOW HARDWARE.
Patented in United States of America and Canada.

Unit Casement Windows

Advantages—A completely assembled product including frames, sash, glass, screens, weatherstrips. Suitable for all kinds of construction, and architect's details. Guaranteed to be weathertight. Complete control of ventilation without direct drafts. Our ventilated transom window is especially suited for schoolhouses and hospitals. Transoms operated without disturbing screens or shades, or may be fixed.

Ease with which windows can be cleaned on the outside from within—thus eliminating danger in cleaning.

Simplicity of construction. May be installed in old frames without disturbing interior or exterior finish.

Materials—***Frames***—Either for brick or wood construction from good seasoned white pine made to our standard or architect's details.

Sash—1¾ in. thick from best white pine.

Glass—Selected quality in the varying thicknesses. Glazed with the best glazing compound.

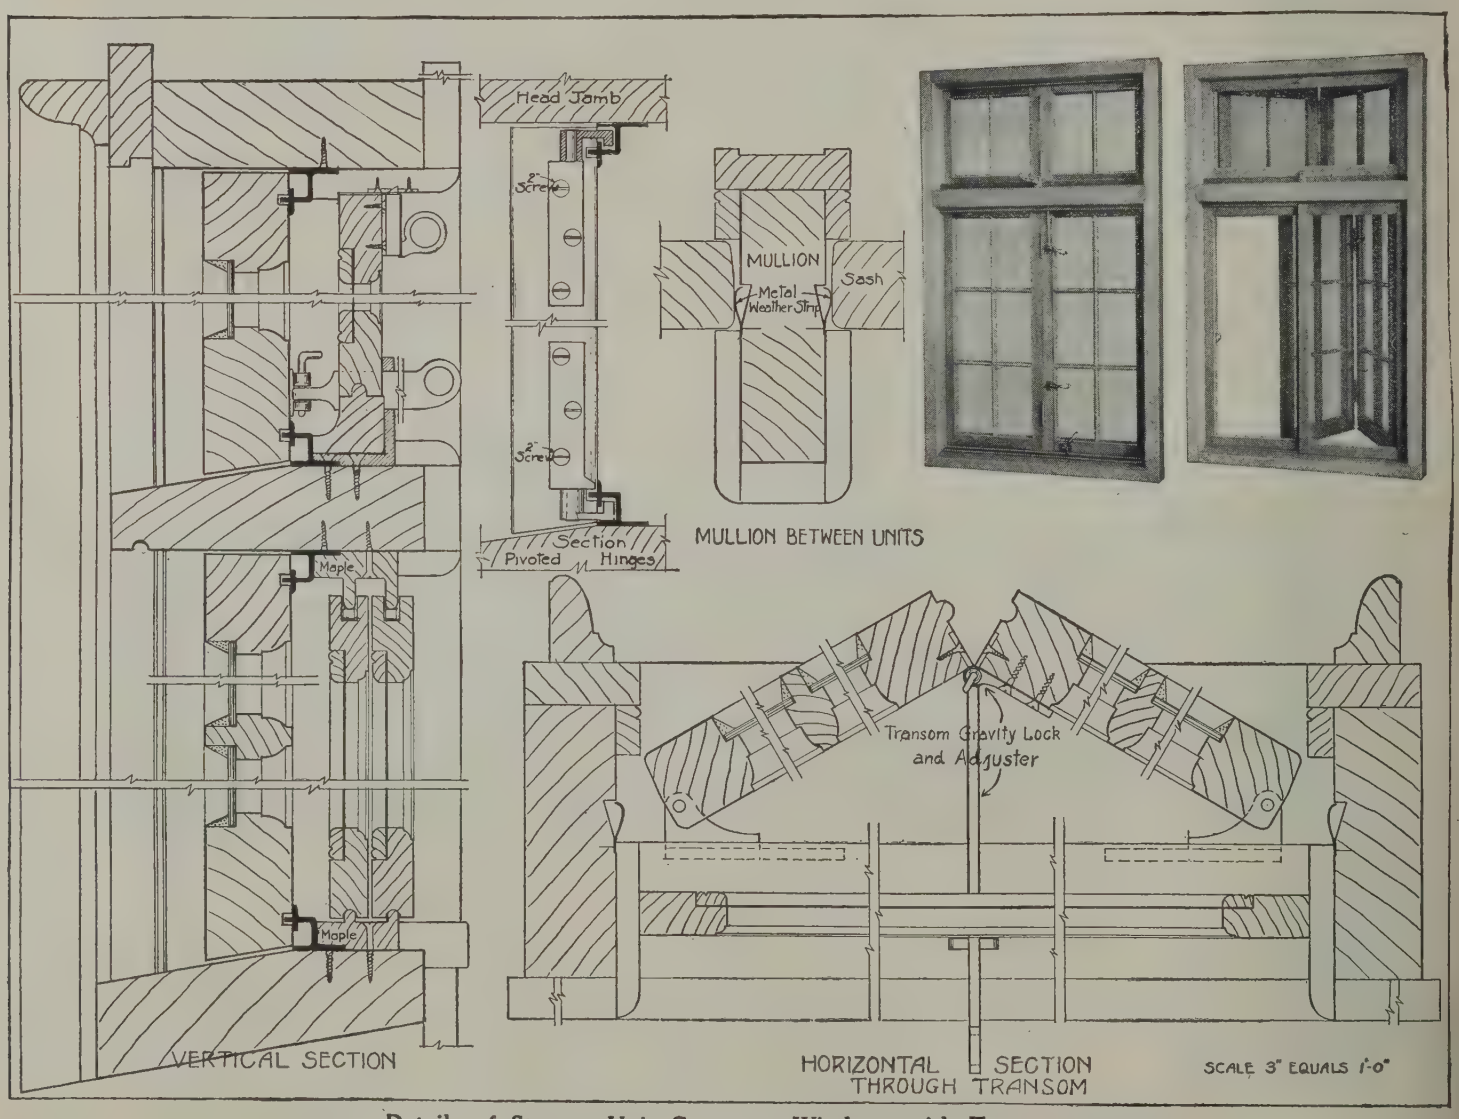
Screens—Made from best of rift sawed white pine, wired with 16-mesh dark copper screen cloth.

Hardware—All solid brass to our special detail, and completely fitted to sash. Special finishes of hardware may be furnished.

Installation—Windows are delivered at the building assembled, and carpenter has only to set units in openings designated on the plans. This completes the job in so far as the operation of sash and screens is concerned.

We do not furnish interior trim. For frame construction make rough openings 5 in. wider and higher than size of sash to be used.

Operation of Sash—A slight outward push in the center of each pair of sash will make the units fold together; they can then be slid to either side, or they may be placed in any position so as to give as little ventilation as desired. For single sash or groups of three,



Details of Stevens Unit Casement Windows with Transom

Continued on next page

the odd single sash opens similar to the units, except that one of the pivoted corner hinges is replaced by an arm, one end of which is secured to sash, other being fastened to jamb, allowing sash to remain rigid in outswung position.

Note: Sashes may be glazed with "Vitaglass," the health-giving window glass, which transmits the curative ultra-violet rays of daylight.

Further information and full sized details for either brick or wood construction furnished upon request.

Hardware for Stevens Unit Casement Windows

The extruded brass track (Fig. 1) is screwed to stool and head jamb the entire width of each opening; the horizontal projecting tongue of track acts as a weatherstrip, fitting into a groove in the sash. The pivoted hinges (Fig. 2) are of cast brass; each hinge slides in extruded track from which it is impossible to become disengaged. Commercial spring bronze weatherstrips are furnished full length for each pair of jambs. Butts are 3x2 in. and are solid wrought brass; two or more being required for each pair of sash, depending on height of sash. The polished cast brass handle and lock (Fig. 3) is used as a lock, a slight turn securely fastening the sash. Polished cast brass top lock for use on high sash (Fig. 4); one lock required for each pair of sash. Transom gravity lock and adjuster for operating transom only (Fig. 5). Loose pin butt (Fig. 6). Handle to open and close the window (Fig. 7).

No. 1-29 Stanwin Casements (20 pages)

CRITTALL SOLID STEEL AND BRONZE CASEMENTS

Custom built to the architect's sizes, designs and specifications

Uses—For banks, public buildings, residences, churches, universities, office buildings, clubs, hospital operating rooms, etc.

Material—The weight of sections, heavy or medium, shall be determined by manufacturer's best standards as set forth on page 46 of Catalogue 1-28. All steel used in the manufacture of these sash shall be Crittalloy—the copper bearing steel—containing not less than 0.15% nor more than 0.30% copper in order to resist rust. All bars shall be hydraulically straightened and free from hammer marks or other imperfections.

Painting—All steel shall receive two coats of rust resisting paint, each coat baked on separately.

Weathering—The sections shall be so designed as to give double contact on all sides without the use of pressed or screwed on fillets or strips of any kind.

Welding—All corners shall be mitered and electrically welded. Plates to receive hardware must be securely welded to the casement sections.

Hardware—All hardware shall be solid bronze, government mixture, toned a dark coinage color, this color secured without the use of plating or chemicals. (Transoms in [describe location] shall be fitted with mechanical operators to operate from floor.)

Note: Specially designed hardware in bronze or hand wrought iron may be specified when desired.

Glazing—All sash shall be fitted with *solid* rolled steel glazing stops for glazing from the inside. Glazing stops shall be mitered at the corners and shall be held in place by countersunk brass screws. (Alternate: All sash shall be fitted with copper covered spring clips for putty glazing from the outside.)

Design—Sash shall be made to the design and sizes shown on the elevations and details. Ventilating units are marked on elevations with dotted diagonal lines; all other units to be fixed or stationary.

Erection—These windows shall be set by the manufacturer and all joints between the steel sash and the collateral construction are to be made tight with the use of Crittall Mastic Cement neatly pointed on the exterior.

(Describe here whether the windows set in ⅜-in. rabbeted stone, wood or cast iron frames, or are fitted with angle fin for setting directly into masonry, or are to set into rabbeted No. 12 gauge pressed metal frames to be furnished by the casement manufacturer but to be built in as the walls go up.)

Details—The details shown above can be varied to suit any given conditions. Wood frames, mullions and transom bars may be used in a detail very similar to the cut stone shown.

In place of the No. 12 gauge hollow metal frames shown in the second detail, ornamental cast iron frames may be used where expense is not a primary consideration.

The third detail is economical and suitable wherever a narrow sight line is sought.

Special Hardware—While standard hardware is of solid bronze, of Government mixture, toned a dark statuary color, in pleasing and substantial designs, specially designed hardware may always be obtained when desired.

Such special hardware may be of bronze, of hand wrought iron, or of bronze nickel, silver or gold plated, to our own or to the architects' designs.

Operating Devices—Mechanical operating devices are available to meet all requirements.

These can range from a simple but effective cam stay for the pole operation of a hinged-at-top-to-open-out casement to a power driven operator for groups of sash.

Shades, Screens and Draperies—In laying out the windows it is always advisable to make provision for shades (if used), drapes and screens and it is recommended that the casement manufacturer be consulted in reference to these three items while the job is still in a preliminary stage.

Co-operative Service—The Crittall Casement Window Company has six branch offices in principal cities and has over fifty representatives. There is usually a branch office or representative near an architect, eager to be of service in the way of details, drawings and suggestions.

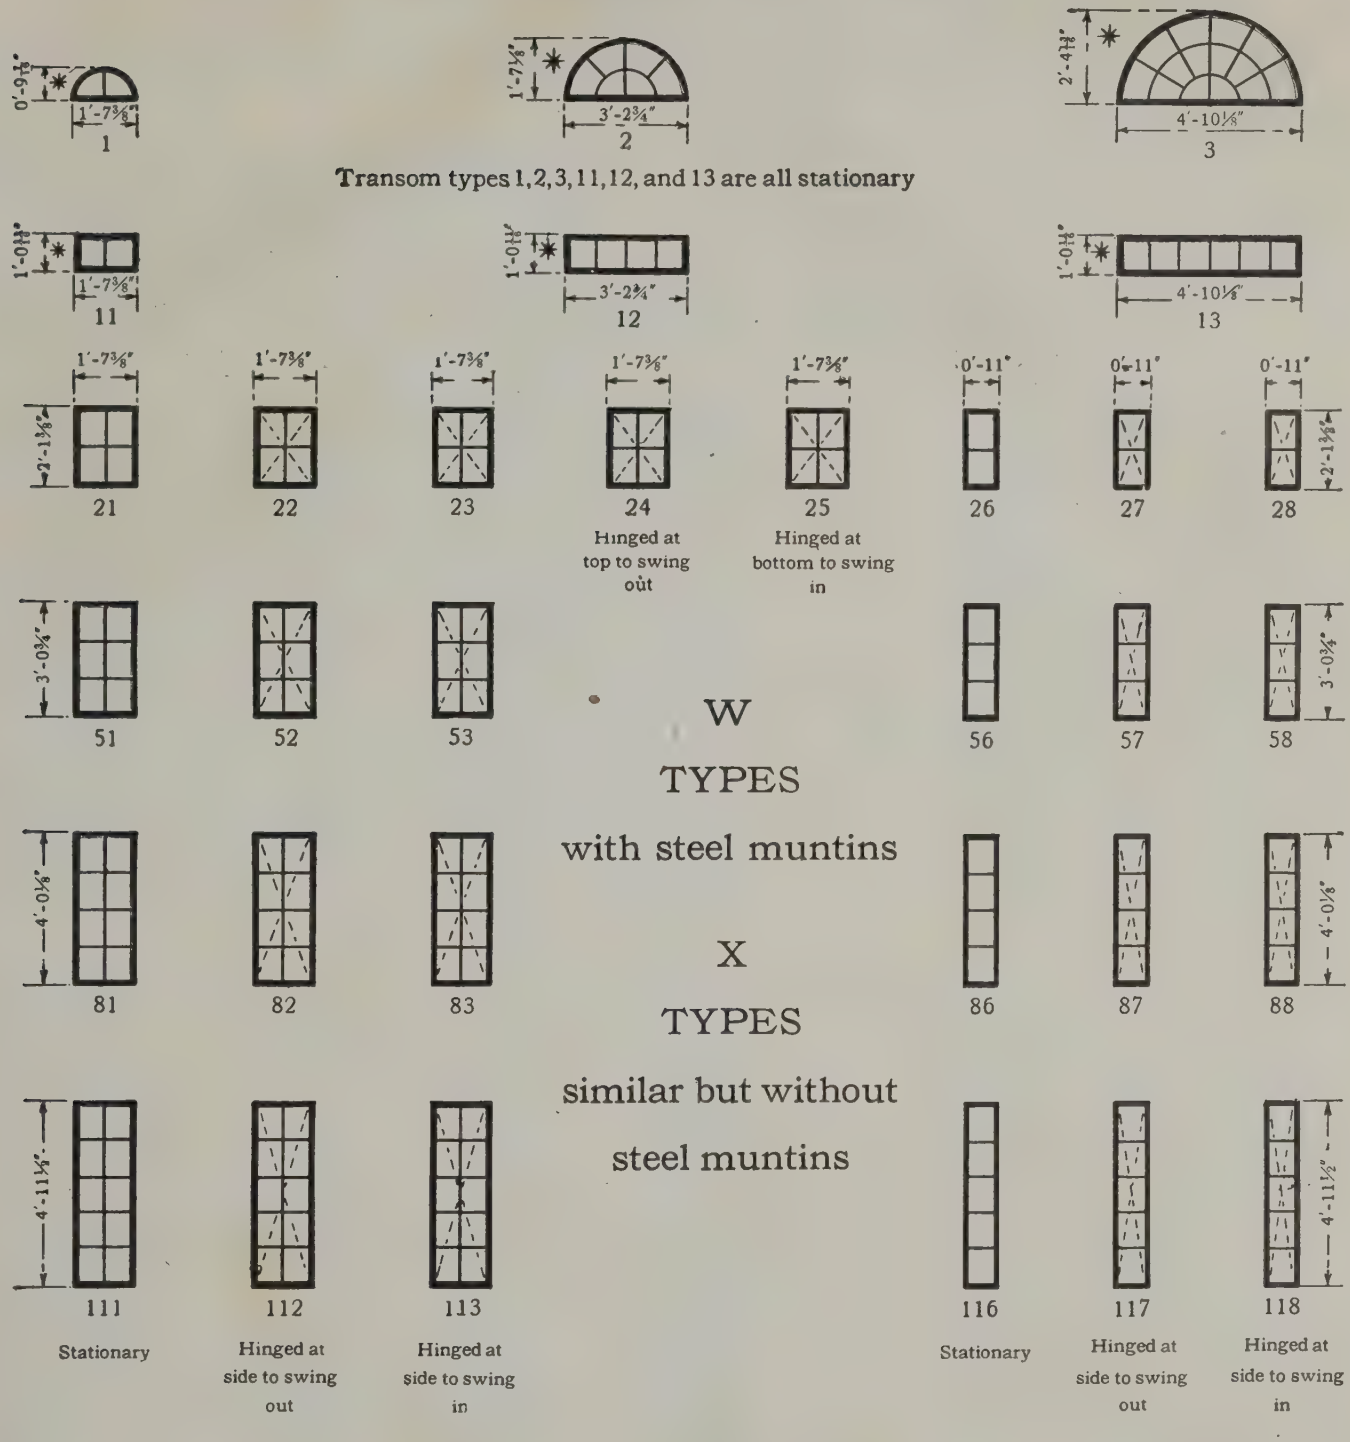
CRITTALL STANDARDIZED CASEMENTS

Standard Sizes and Types



All hinged at side sash are made in both right and left hands

Uses

These *Standardized* casements are designed for projects where the architect desires to use the best. Economy is effected by standardization but quality is maintained. Residences, churches, clubs, libraries and similar buildings may use these windows to advantage.

Hardware

All handles are of solid bronze of Government Standard. They are well designed and finished and are toned a dark statuary bronze color. Stays are bronze finished, adjustable friction type, and are fitted at the head of each casement.

Sections

Standardized casements are made of the medium section illustrated on the previous page.

This same section is also used in our custom built work for side hinged sash up to 2 ft. 3 in. wide by 6 ft. high.

Guaranty

When we are permitted to erect our casements, our windows, both Custom Built and *Standardized*, both inward and outward opening, are guaranteed weathertight against wind and rain under the most severe conditions.

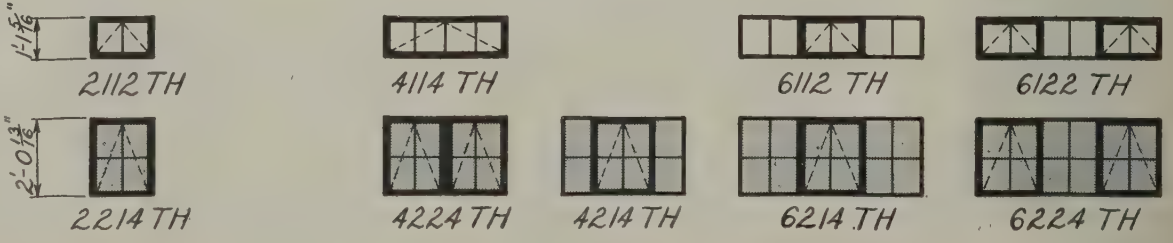
The handing of casements is determined by the hinge location viewed from the outside. Thus a casement hinged at the right is a right-hand casement.



Continued on next page

A PRODUCT STANWIN OF CRITTALL
CASEMENTS

Stanwin Casements properly set are weathertight. They are of two-point flat contact solid rolled section and are considerably heavier than the ordinary cottage casement.

Stanwin Units can be assembled with one another into an almost limitless arrangement and thus provide windows in complete harmony with a wide variation of design, suitable in every respect to meet the most exacting requirements.

The hardware used on Stanwin Casements is of substantial design and quality with all moving parts of solid bronze. The finish of the sash is a prime coat of antirust primer and a second coat of gray zinc oxide paint, forming a complete protection and giving an excellent base for the final color coats in the field.

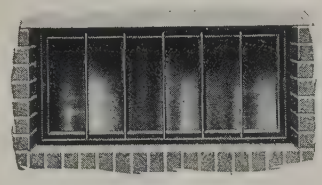
TAYLOR-DES MOINES COPPER STEEL CASEMENT WINDOWS and UTILITY WINDOWS, Standard and Security Types.

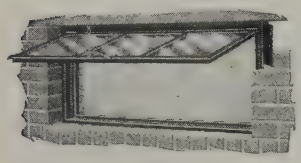
STEEL SCREENS and STORM SASH.

For Coal Chutes, Ash Pit Doors and Ash Dumps, see page A705.

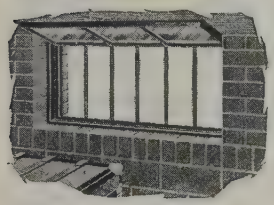


Copper Steel Basement Windows (Patented)

These windows are offered in two types, Standard and Security. Both types have all the features described and are identical throughout, except for the guard bars on the Security type. Both frame and sash are made of rust-resisting *copper steel.*



Standard Window—Inside



Security Window—Inside

Taylor-Des Moines Security Windows—Provide permanent protection against prowlers with no sacrifice in appearance. With these windows, the ventilators may be left open indefinitely without danger.

Five ½-in. solid steel bars intersect the frame and are welded to it at top and bottom. They cannot be bent because they are built solidly into the frame, which is reinforced by the groove formed for the sash top.

Bars do not interfere with either screens or storm sash which fit against the face of the frame.

Features—The *extra wide frame* provides a better bearing than is possible with a bar frame.

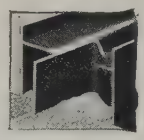
A *large mortar pocket* is formed by facing flanges and the groove of the formed stop. It holds enough mortar to seal the frame in the wall. The flanges provide a guide for the mason on both sides of the anchor plates, which extend ¾ in. beyond the flanges.

The *self-weathering hinge* utilizes the full weight of the glazed sash to press against the frame stop, insuring a tight fit at the top. The sash is easily removed from the inside only. The hinge lugs are welded to the sash. There are no rivets, cotters or other removable parts—nothing to wear out or get out of order.

Tight weathering between frame and sash is secured by the positive action of the lever latch. The bottom sash member has a slight curvature, corners make contact first, the latch draws up the center, insuring an all-around tight fit.

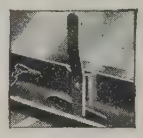
Easy to screen. All frames have slots for attaching screens or storm sash, by means of levers.

Electric arc welding—is used at every joint of frame and sash. Every window is straight and true and remains so permanently.



Frame Corner

Lift-Out, Self-weathering Hinge



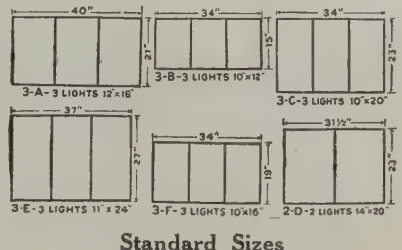
Lever Latch

Screen Slot

There are *no depressions or grooves to hold moisture.* The importance of this in resistance to corrosion is self-evident.

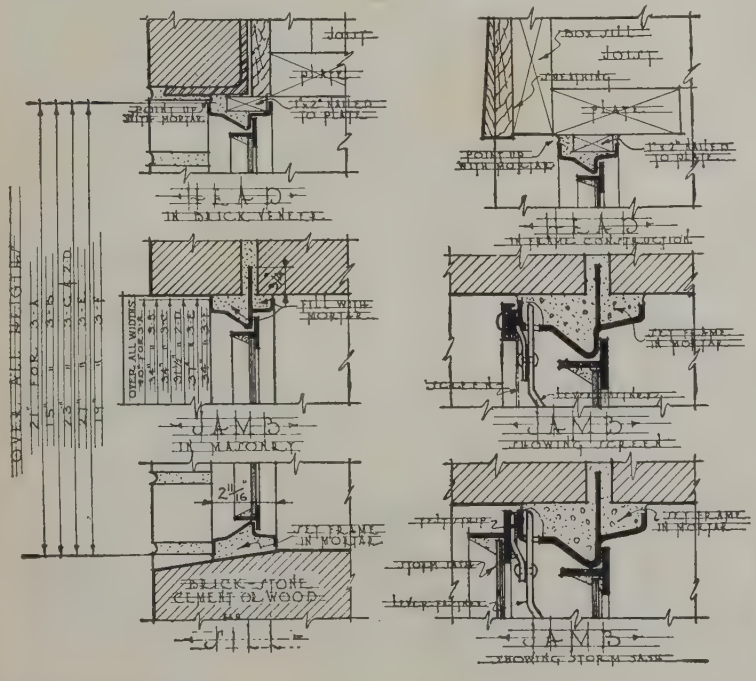
Made of copper steel. The superiority in rust-resisting properties of copper steel is universally recognized.

Construction and Sizes—The frames are of formed copper steel, about 2½ in. wide. Sash are rolled copper steel bar, 1x1x⅛ in. Anchor plates are securely welded to the jambs and extend ¾ in. into the masonry. A 12-in. chain is attached to the ventilator for support when open.



Standard Sizes

Both types are made in six standard sizes as shown. Special sizes are built to order and can be delivered in a few days.



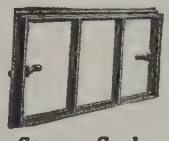
Steel Screens and Storm Sash

Steel screens and storm sash are available for Taylor-Des Moines Windows. No separate fittings are necessary, all fasteners being permanently attached to screen or storm sash. Quickly put on and removed. Also furnished with necessary fittings for attaching to other windows.

Type R Screen—Cold-rolled round steel frame, extra heavy black enameled wire cloth. Lever fasteners, welded to frame, operate in the slots of the window frame.

Type S Screen—Heavy channel steel frame (⅛ in.) welded at the corners. Best grade of bronze or galvanized cloth, 16-mesh, which can be easily replaced when necessary. Lever type fasteners.

Steel Storm Sash, Weatherstripped—A strip of wool felt is cemented to the face, which fits against the flanges of the window frame. Lever type fasteners are used. Ordered by the size of the window to be fitted. Standard sizes of glass are used.



Storm Sash

Type R Screen

Type S Screen

J. S. THORN COMPANY

Thorn Products

PIVOTED WINDOWS, PROJECTED WINDOWS, CONTINUOUS WINDOWS, WINDOW OPERATORS, SKYLIGHTS.

BURVETT VERTICAL LIFT DOORS.

Also Industrial Steel Doors, Counterbalanced Windows, Double Hung Windows.

For Steel Casements, see pages A1296-1298.

THORN STEEL WINDOWS

Industrial Steel Window Catalogue

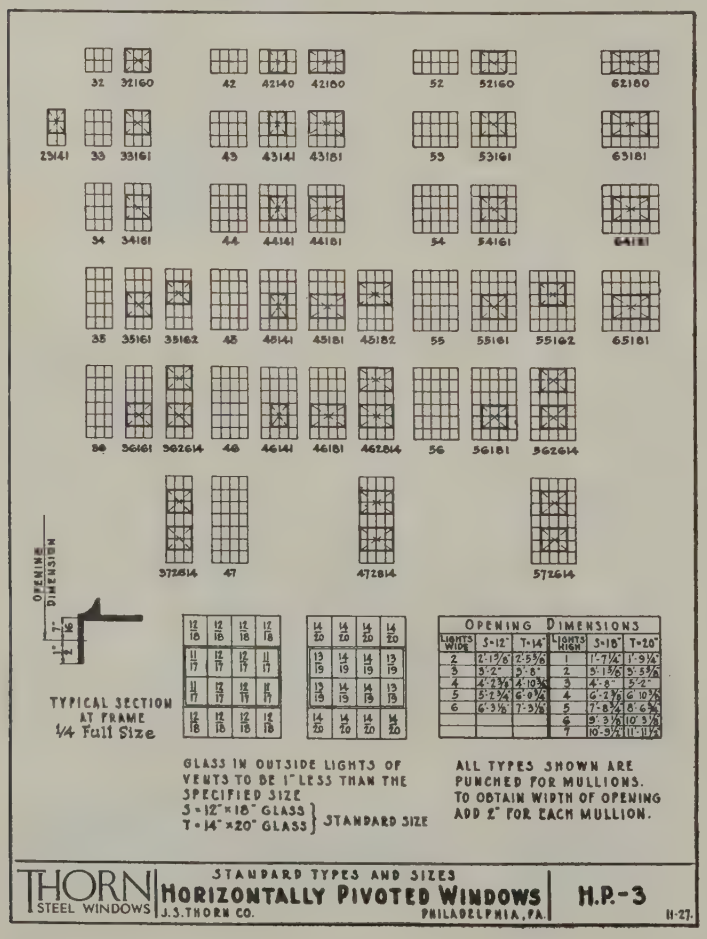
New Catalogue F-S-5 shows Thorn steel windows for industrial plants. It will be sent on request.

Thorn Pivoted Windows

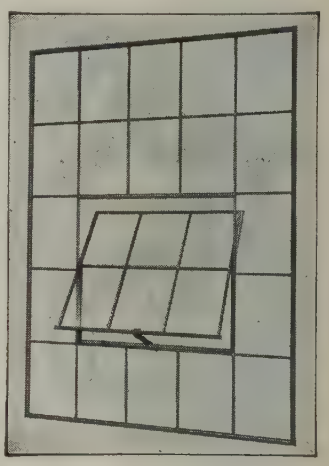
Designed for use in all types of industrial buildings and constructed of solid steel sections 1⅜ in. deep. They are of substantial construction having all muntin joints welded. Ventilators are double weathered and hung on strong steel butts. Thorn windows are given one good priming coat of gray enamel at factory but should receive two coats of paint after erection.

Standard windows are furnished only in 12x18 and 14x20-in. glass sizes, except in the lights of vents where it is 1 in. less on each outside edge.

Standard windows may be combined to form a great variety of widths and are made with uniform punching in the jamb members to match the slots in the standard mullion bars. Any combination of standard units may be obtained by joining them together with standard mullions. For heights greater than obtainable with standard units they may be joined with horizontal mullions.



Underwriters' Type — The Underwriters' label can be furnished when specified and as an extra. No unit shall exceed 7x12 ft. and ventilators shall not exceed 4x5 ft. No more than two vents shall be in a single window unit. Ventilators must be pivoted above center. Ventilator hardware must conform to rules of local board.



Thorn Pivoted Window

Thorn Projected Windows

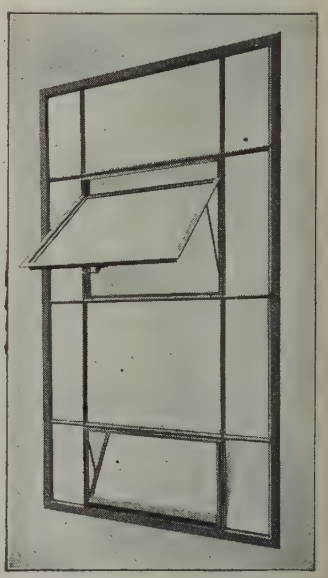
Economical office windows for industrial buildings, offices, schools, hospitals, etc., where screens and shades are necessary. Made of the same steel members and the same welded construction as Thorn pivoted windows.

They are made in commercial and architectural designs. The commercial type contains equal lights of 12x18 or 14x20-in. glass and are similar to pivoted window standards. The architectural type are made with combinations of large and small lights similar to typical window shown.

They are fitted with bronze shoes with friction adjustment which slide up and down in the stationary jamb members of the vent openings as the ventilator is closed and opened. These friction shoes together with the steel side arms attached to each ventilator hold the vent in any position.

Projected windows may be combined by the use of mullions the same as pivoted windows.

Underwriters' Type — Underwriters' label can be furnished on commercial projected windows only. Size limits are the same as for pivoted windows and vents must open out.

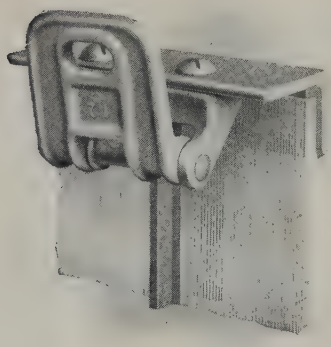


Thorn Projected Window

Thorn Continuous Windows

For use in roof construction. When properly incorporated in roof design they will perfectly daylight and ventilate buildings of great widths and lengths, increasing the efficiency of the workers and the quality of the product.

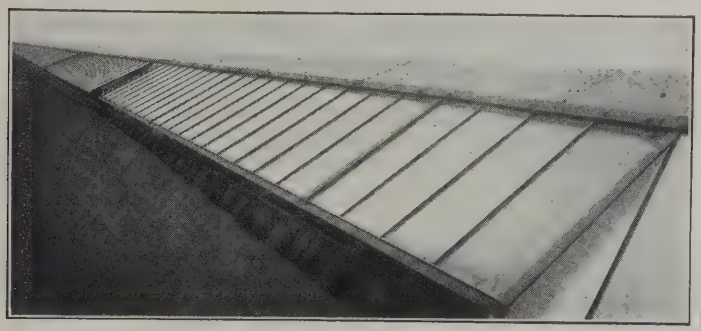
Continued on next page



Thorn Malleable Hinge

Controlled by long lines of the powerful Thorn tension operator they are particularly effective in quickly carrying off smoke, gases, etc. They form a great glass awning when open, the unbroken line of steel and glass permitting ventilation regardless of weather conditions. Stationary storm panels will be provided at the ends when ordered.

The continuous window is made of a series of window units connected together. Each unit is ruggedly built of heavy one-piece steel members. The windows are hung on heavy malleable iron, free movement hinges.



Thorn Continuous Windows

Whenever possible, continuous windows should be erected only by experienced men. We maintain a field organization to do this work and if erection is a part of the contract we assume full responsibility for a satisfactory installation.

Flashings, when necessary at head, sill and jambs of openings or gaps in the window lines, should be furnished by the contractor for the sheet metal work. They are not included with the windows.

Thorn Window Operators

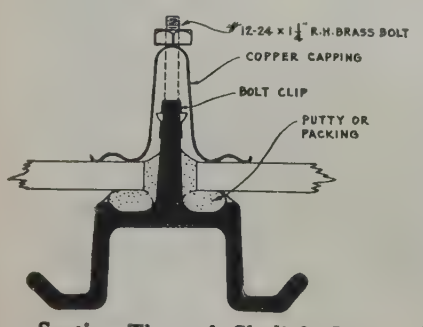
Made in two types, tension operators and torsion operators.

Tension Operator—Is designed for long and heavy lines of windows. It is a smooth working mechanism free from friction. Practically the entire load is carried by compound lever arms, eliminating strain on the tension line. Made for manual or motor operation.

Torsion Operator—Is for short runs of ventilators. Consists of a revolving shaft to which are attached pressed steel arms which have a connecting link attached to the ventilators. Made for chain or pipe operation.

Thorn Steel Skylights

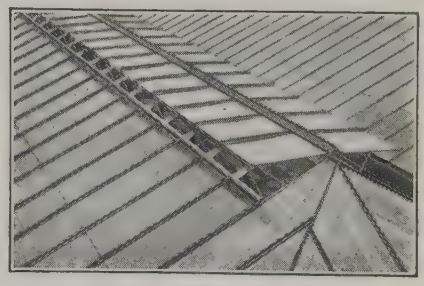
Composed of a series of heavy rolled steel bars of special design. These bars provide permanency and strength in skylight construction and have made possible glass roofs of vast areas. The bar provides wide glass rests which permit extreme expansion and contraction. It also provides wide gutters to carry off large amounts of condensation. Bars can be furnished in a single length of 30 ft. and roof purlins may be spaced as much as 8 ft. without danger of sag.



Section Through Skylight Bar No. 30

Parts of the bar subject to elements from within, such as steam, gases, etc., are accessible for painting without disturbing the skylight in any way. Portions of the bar above the glass are covered with a pressed metal cap of galvanized iron or copper and attached by brass screws.

Thorn skylights may be entirely fixed or arranged with a ventilating section operated by a Thorn torsion operator.



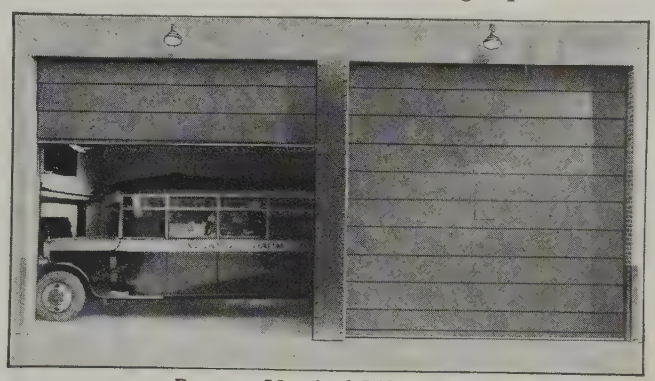
Thorn Steel Skylight

Burvett Vertical Lift Doors

The improved Burvett Vertical Lift Door, manufactured by J. S. Thorn Company, is, we claim, the most modern development in steel door construction and fills a long-felt need for a sturdy, burglar, fire and weather proof barrier that operates with the utmost simplicity, requires no wall space, and on which the cost of maintenance is extremely low.

The limitations of other types of doors used in the past have been fully overcome in this new design.

It is built of a series of 16 gauge steel plate interlocking panels, which lift vertically, telescoping into a compact group to the height of a single panel and require a head clearance of about only 22 in. when completely raised. The door is raised by means of a hand chain or motor power, turning a grooved spiral drum and winding two lines of heavy steel cable attached to the bottom plate panel.



Burvett Vertical Lift Doors

When operated by hand, or by a one-way motor, it is lowered by lightly pulling a hand chain attached to a brake lever, disengaging the clutch and permitting the door to lower by gravity and being checked by counterweights.

As each section lowers, lugs attached to the extreme ends of the panels are forced by heavy flat springs attached to the bottom panel into pockets formed in the heavy channel jamb guides, hold each panel securely and allow only a slight deflection under extreme wind pressure.

The bottom panel is equipped with two plungers, which automatically lock the door when fully closed.

The great utility of this door, and the ease with which the plates can be removed and repaired, make it particularly desirable for warehouses, piers, freight stations, loading platforms, garages, factories, aeroplane hangars, and buildings of similar character, for it is built to stand hard usage.

J. S. THORN COMPANY

Manufacturers of Solid Steel Casement Windows

Allegheny Avenue and Twentieth Street, PHILADELPHIA, PA.

BRANCH OFFICES

NEW YORK, N. Y. CHICAGO, ILL. BOSTON, MASS.

Products

THORN STANDARD RESIDENCE and MANOR TYPE CASEMENTS and DOORS for residences, apartments, dormitories, etc.

THORN COTTAGE CASEMENTS.

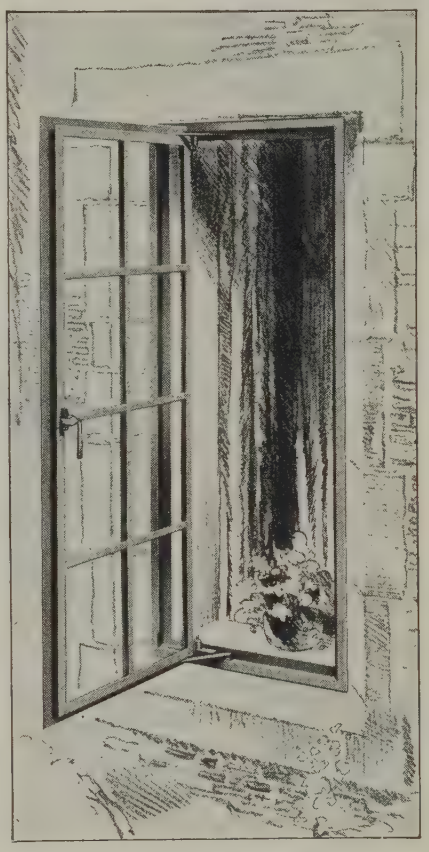
THORN MEDIUM and HEAVY TYPE CASEMENTS—Side Hung and Projected.

For other Sash Products, Sash Operators and Vertical Lift Doors, see pages A1294-1295.

Thorn Standard Residence Type Casements

Produced in standard sizes, made of specially rolled solid steel casement sections of substantial weight, and designed to produce a most rigid construction. At all corners the sections are mitered, electrically butt-welded and ground to a smooth finish. Steel muntins have a 5/8-in. face and all intersections are flush and electrically welded. All casements are accurately made, carefully fitted and when properly installed in the building are weathertight under all conditions. Casements are equipped with Thorn solid bronze straight handles and strikes, and Thorn cleaning hinges of solid bronze.

Thorn Cleaning Hinge—A new type sliding hinge of solid bronze for Thorn solid steel casements, which, when closed has the appearance of an ordinary butt hinge and, when open, permits cleaning of the glass from the inside. Not only is the unsightly extension or offset hinge eliminated, but also the sill adjusters, as the Thorn sliding hinge, with friction adjustment, holds the casement securely, top and bottom, in any position.



Thorn Residence Casement

Advantages—Thorn metal casements are of the finest quality and create an architectural appearance which can not be obtained by the use of wood windows. They have all the advantages of double hung windows and, in addition, they provide 100% ventilation. They control ventilation by conducting breezes into the building and to a certain extent will exclude rain while the windows are open. They are economical, costing no more than a good quality wood casement and are more reasonable in price than double hung windows. They need not be weatherstripped because of their watertight construction. They can not warp, shrink, or swell as do wood windows.

Thorn Cottage Casements

Thorn Cottage Casements are for use in the more modest homes where economy must be exercised, and the allowance for windows will not permit the use of the Thorn Residence and Manor types.

The general construction is similar to the Thorn Residence type, although steel sections of lighter weight are employed, and they are fitted with iron fasteners, sill adjusters and extension hinges to permit glass cleaning from within.

They can be furnished with bronze fittings, combination iron and bronze friction cleaning hinges or with a type of under-screen operator at an extra cost.

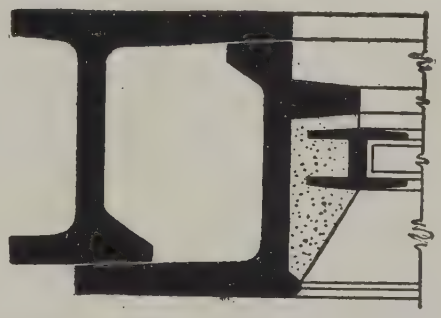
Thorn Manor Casement Windows

A standardized casement of the finest quality combining the very best of materials and workmanship.

The design of the sections incorporates refinements of the most minute nature to gratify architectural desire for a sturdy, well made casement, particularly adapted to leaded glass with neat, narrow sight lines and short putty bevels.

The famous Thorn Hinge, strong, pleasing to the eye and unequalled in performance, is standard equipment.

The "Manor" is an accomplishment in steel window craft befitting the finest architecture.



Full Size Section of Thorn Manor Casements

Thorn French Casement Doors

The very finest of materials and the highest quality of workmanship are incorporated in the standard Thorn French Casement Doors. They are made of heavy casement sections solidly welded at the corners, and the lower section of the door is arranged with a small kick panel of furniture steel. The sill of the frame is a heavy extruded bronze threshold riveted and brazed into the jamb members. They are fitted with beautiful bronze hardware including cremone bolts and friction adjusters at the head and receive two coats of gray enamel, oven dried, before leaving the factory.

The standard type is made to fit an opening 3 ft. 7¾ in. x 6 ft. 10 3/16 in. and can be arranged to open in or out.

Thorn Manor Casement Doors

We also manufacture a more economical door known as the *Thorn Manor Casement Door* composed of sections adapted to putty glazing. This door is made with standard steel frame section at the sill and is fitted with head and foot bolts and bronze handles.

TYPICAL INSTALLATION OF THORN CASEMENT IN STEEL SUB FRAME

Thorn Medium and Heavy Type Metal Casements

For use in more elaborate residences, churches, banks, office buildings, etc. Constructed of heavy 2-point specially rolled steel casement section. Constructed with the same care and accuracy as Thorn light casements. Glazing may be provided for by the use of putty only or glass may be held in place with drawn steel glazing beads which are accurately mitered at the corners and held in place with brass oval head screws. Solid bronze hardware is used throughout.

Where desired, Thorn medium and heavy type metal casements may be provided with a pressed metal subframe which is built in and the casements placed after openings are prepared.

Made to open outward or inward. These larger sections lend themselves admirably to the construction of French casements.

Architectural Service

In designing buildings in which Thorn metal casements are to be installed, it is always well to detail the openings to receive the windows after masonry work is completed. We will at all times be glad to co-operate with architects, owners and builders in the proper preparation of details and will forward on request our booklet covering usual installation conditions for Thorn standard units.

TRUSCON STEEL COMPANY

Manufacturers of a Complete Line of Building Products Including Steel Windows and Mechanical Operators

EXECUTIVE OFFICES AND PLANT
YOUNGSTOWN, OHIO

Warehouses and Offices in All Principal Cities, see Local Telephone Directory

Products

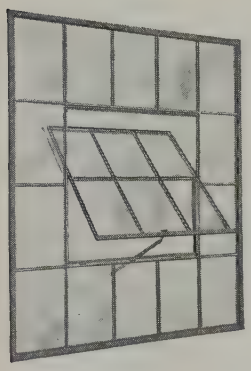
Truscon manufactures a complete line of STEEL WINDOWS for industrial, commercial, public and residential buildings. Also Manually and Electrically Controlled OPERATORS for all ventilating requirements.

TRUSCON STEEL WINDOWS

For other Truscon Products, see pages in this edition as follows:

Concrete Reinforcement, page A151; Steel Roof Decks, page A213; Steel Joists, page A674; Steel Doors, pages A986-987; Metal Lath, pages B1704-1705.

TRUSCON HORIZONTALLY PIVOTED STEEL WINDOWS



Horizontally Pivoted Window

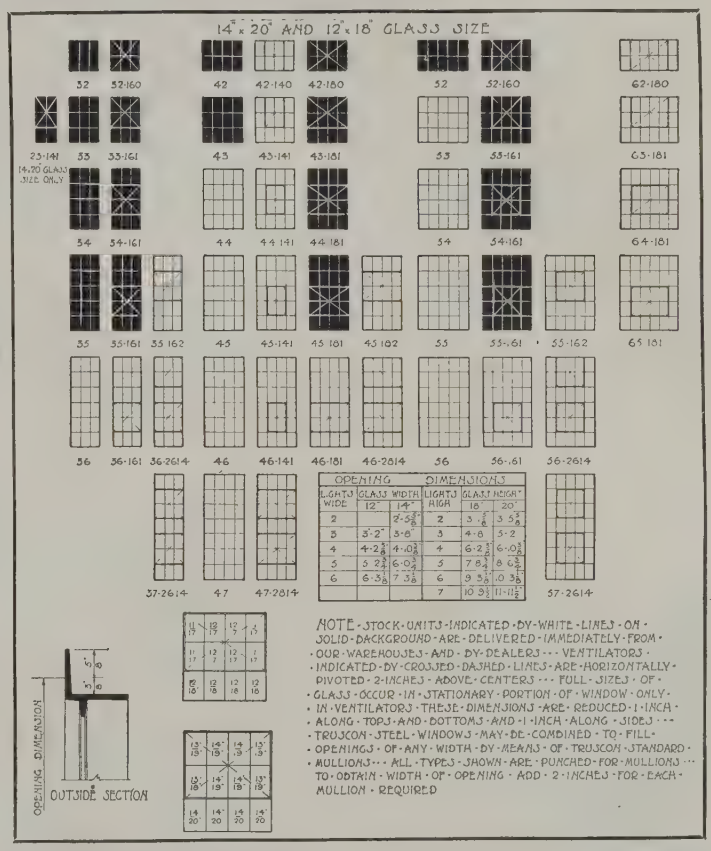
Description

Recommended for use in factory buildings, warehouses, public and private garages, store and loft buildings, inexpensive schoolhouses, gymnasiums, and other structures where economical steel windows are required.

Made of heavy hot rolled copper steel sections. The outside section is of angle shape to allow 5/8-in. anchorage at the masonry or mullion connection. The intersections of the horizontal and vertical members are dovetail mitres, rigidly interlocking the bars. Double contact weathering is provided on all four sides of the ventilators.

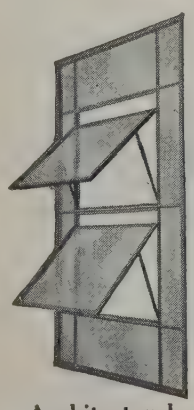
Sizes

Horizontally pivoted steel windows are furnished in various sizes to fill practically all building needs. The diagram shows the fifty standard types, available in either 14x20-in. or 12x18-in. glass size. Stock units, indicated by white lines on black background, are available for immediate delivery from any of our warehouses and from dealers' stocks. They can be combined with standard mullions to fit practically all sizes of window openings.



TRUSCON PROJECTED STEEL WINDOWS

In buildings having no provision for ventilation other than the natural clearing off of vapor, smoke and stale air through the windows, Truscon Projected Steel Windows are the most practical and efficient sidewall windows available. They can be kept open in all kinds of weather and at any desired angle. Their tilted ventilators, while acting as deflectors of the elements, effect a continuous change of air, at the same time eliminating direct drafts and protecting the interior of the building against damage from driving rains or snows. These windows are made in sizes to meet all ordinary building requirements and in two types as described below.



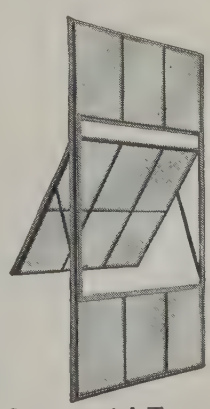
Architectural Type, Projected Steel Window

Architectural Type

The architectural type of Truscon Projected Window emphasizes proportion as well as practicability. In keeping with the greater suggestion of massiveness to be found in most monumental buildings, its outside frame is a heavy channel. All corners of the frame are welded and ground. The ventilators are formed of hot-rolled angle members. This adds greatly to their appearance and strength and results in greater resistance to corrosion through the elimination of needless joints and cracks. Glazing angles improve the general appearance as does also the practice of using large glass lights.

Commercial Type

Where plain design and economy are the keynote of the construction, Truscon Commercial Projected Windows should be specified in place of the architectural type. While the essential features of each are identical, the commercial type can be furnished at lower prices, as a result of standardization and volume production. On account of the fact that glass sizes of the commercial type are the same as those used in pivoted windows, commercial projected windows can be used in the office section of an industrial plant with complete conformity to the general external design. These windows are also very popular in buildings such as schools, garages, filling stations, printing shops, warehouses and so on.



Commercial Type, Projected Steel Window

Continued on next page

TRUSCON CONTINUOUS STEEL WINDOWS

Types

Truscon manufactures continuous steel windows, in top hung, bottom hung and center pivoted types, or combinations thereof, for use in "A" frame, monitor, sawtooth, valley roof or sidewall construction. Windows of this type, used in conjunction with mechanical operators, afford the most efficient means of daylighting and ventilating industrial buildings.

Truscon Continuous Steel Windows are manufactured entirely of copper bearing steel, making them highly resistive to the corrosive influences of gases finding their escape through the roof openings in the factories of many industries.

Exclusive Construction Features (See Plate)

Top Rail—Is an extra heavy, specially designed hot rolled channel section, one leg of which rests in the continuous hook section of the hinge member, insuring positive weathering and ease of operation.

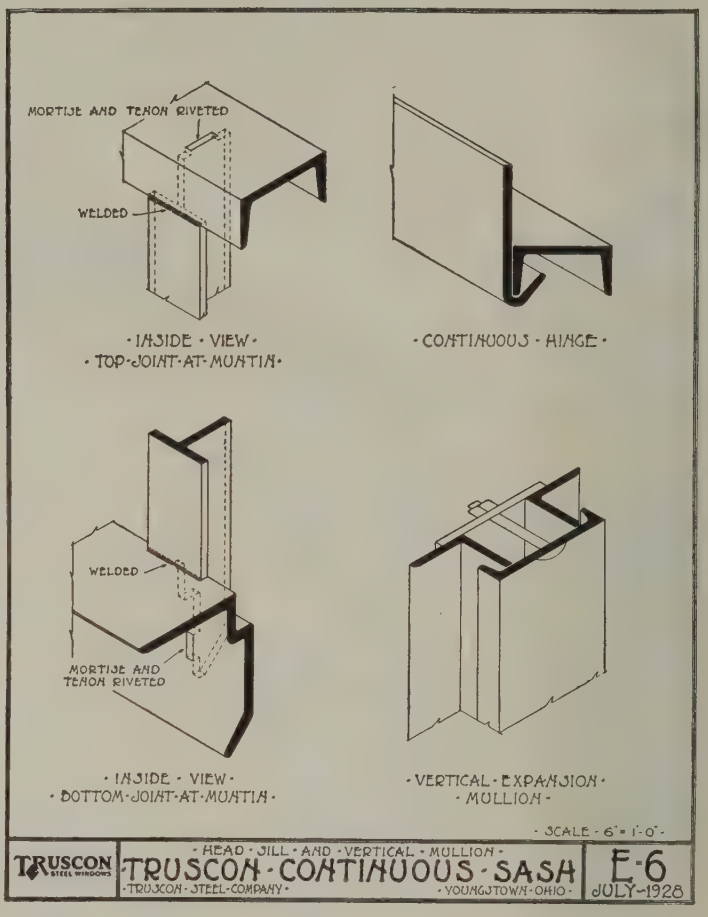
Continuous Hinge—Is a patented feature which insures straight alignment, positive weathering and complete freedom for expansion and contraction, eliminating glass breakage and preventing damaging strains on the sash.

Bottom Rail—Is a heavy hot rolled section, specially designed to give the required strength between points of support and to bring the glass flush with the outside face of the sash to insure perfect drainage whether the window is open or closed.

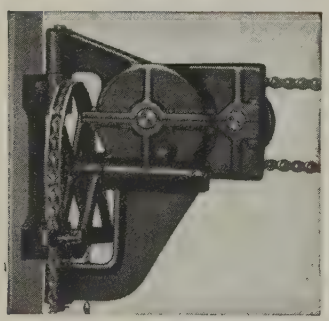
Vertical Muntins—Are heavy T-sections securely joined to the top and bottom rail by mortise and tenon joints, air hammer riveted and securely welded, making these windows the strongest and most rigid on the market.

Sizes

Truscon Continuous Steel Windows are made in standard heights of 3, 4, 5, and 6 ft., in runs of any length assembled from standard 20-ft. long panels in which muntin bars are spaced 2 ft. on centers. Our Engineering department will be glad to co-operate with you in the selection of the proper type for any project.



TRUSCON MECHANICAL OPERATORS

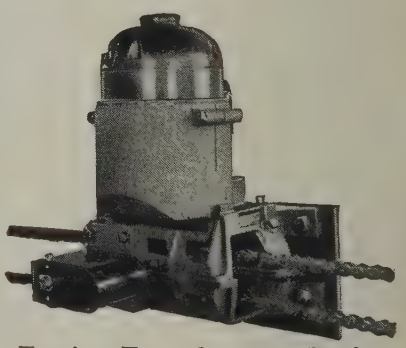


Tension Type Operator Hand Power

Truscon manufactures window operators of various types and designs for the control of either continuous or sidewall windows. They are designed for either manual or electrical control and are made in light and heavy duty types adaptable to runs of any length.

Electrically controlled types can be wired so that the opening and closing of all windows in an entire building may be directed from a central switchboard, making it possible for one man to regulate the ventilation in any part of a building by the mere pressing of a button, thus saving the time of other workmen and placing the responsibility for proper ventilation on one individual.

Truscon Mechanical Operators are simple in design, mechanically right, dependable, smooth running and permanent. The Truscon engineering department will gladly help you in the selction of operators for any project, giving a complete and thorough analysis based on your individual requirements.



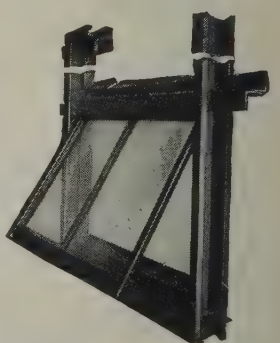
Tension Type Operator Duplex Power

TRUSCON POWERHOUSE STEEL WINDOW FRAMES

Section of Structural Steel Frame

The daylighting and ventilating of powerhouses is today effected through the medium of either continuous window panels or pivoted or projected type windows arranged vertically in multiple units. Where these panels are of great height, as is ordinarily the case, it is necessary, both from a structural and an architectural standpoint, to set these windows in heavy steel frames.

Truscon supplies two types of frames for this kind of work—an economical frame built up from structural steel sections and an ornamental pressed steel frame. The pressed steel frames are welded at all construction joints and the corners are reinforced. Both types of frames are made in any size to fit any special requirements of design.



Section of Pressed Steel Frame

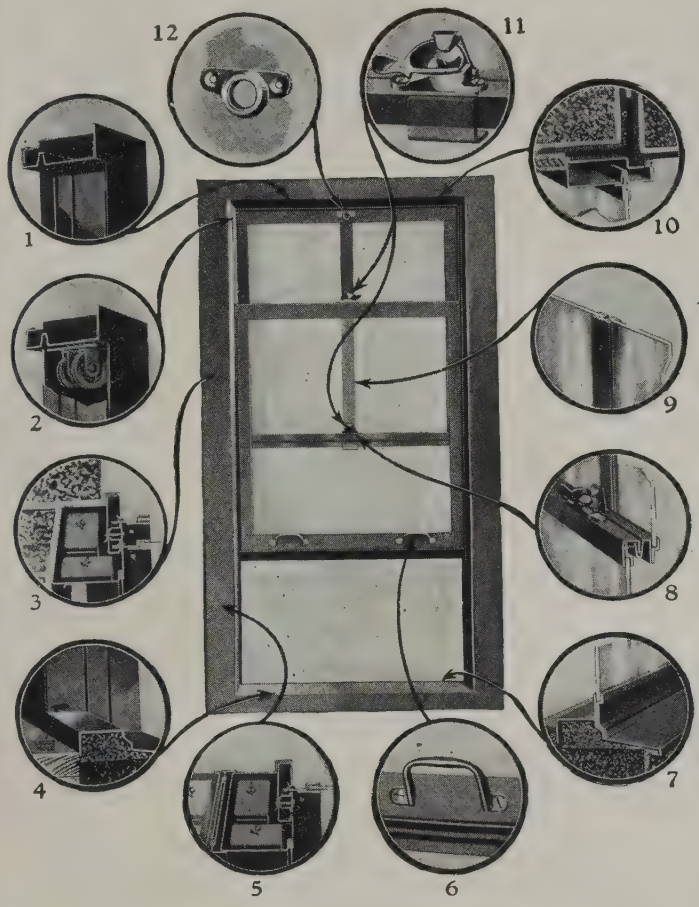
TRUSCON DOUBLE HUNG STEEL WINDOWS

Model No. 28—Counterweighted

A moderately priced, solid steel, plate type, double hung window for use in hotels, office buildings, hospitals, schools and similar buildings. It is neat in appearance, smooth in operation, and rigid in construction. Heavy steel sections, electro-galvanized, make it a most durable window, while careful design and proper weatherstripping make it weathertight to a high degree.



Construction Details and Hardware Model No. 28

(1) *Section through head of frame* showing one-piece channel construction with recess to receive upper sash rail; staff mould formed from two thicknesses of metal and head cover welded to frame section.

(2) *Cut-away view of jamb frame* showing bronze-bushed, pressed steel chain pulleys that turn on hardened steel pins in heavy, pressed steel housings. Pulleys are deeply grooved to prevent sash chains from rolling off.

(3) *Section through jamb* illustrating the dual function of the jamb frame as weight box and sash guide. A removable weight-pocket-cover-plate extending from sill to head makes the weights easily accessible and a light metal parting strip between the weights prevents them from becoming twisted or locked together. Sash parting stop is adjustable and held in place with one line of sherardized screws. Proper weathering is secured through spring bronze weatherstripping attached to the sash stiles.

(4) *Concealed grout holes* at each end of sill, and back of the removable cover plate, make it easy to fill the opening under the sill with grout, thus assuring a firm and weathertight bed for the window.

(5) *T-shaped mullions* are used for joining two or more windows in a single opening and are held in place by means of concealed steel straps which eliminate all unsightly screws, bolts, nuts and other objectionable projections.

(6) *A pair of lifting handles* are tap-screwed through two thicknesses of metal to the bottom rail of the lower sash.

(7) *Sections through bottom of window* showing double contact weathering between sash and sill. Sill section of frame is formed from a single piece of steel with all offsets graduated to the outside to insure good drainage. Proper weathering is secured through spring bronze weatherstripping attached to sash rail.

(8) *Section through meeting rail* showing interlocking contact between upper and lower sash, and spring bronze weatherstripping on upper rail of lower sash. Brass weathering plates are attached to parting stops at meeting rail to assure additional weather protection. Bottom rail of upper sash is shaped to act as a drip.

(9) *Muntin bars* can be furnished horizontally and vertically to secure small glass-light effects. These are interlocked and welded at all intersections.

(10) *Section through head of window* showing adaptability of head section to any type of construction and positive contact between sash and frame. Proper weathering is secured by the use of spring bronze weatherstripping.

(11) *Combination sweep lock and pull down handle,* adjustable to secure proper contact and locking.

(12) *A pole socket* attached to the top rail of the upper sash facilitates opening and closing this sash.

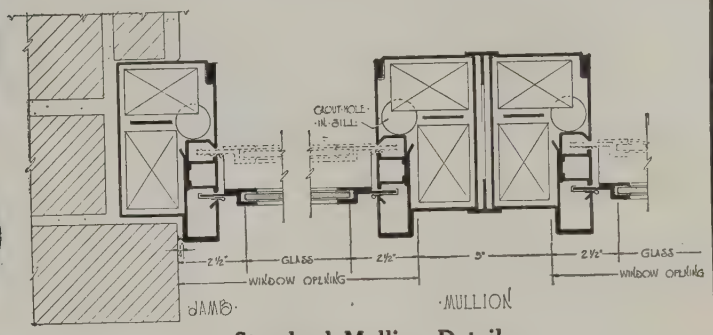
Note: Standard hardware is sherardized malleable iron. Solid bronze can be supplied when bronze hardware is specified.

Standard Sizes

Standard Sizes—Model No. 28 Double Hung Windows are furnished in widths ranging from 3 to 5 ft. and in heights from 4 to 9 ft. in increments of 6 in.

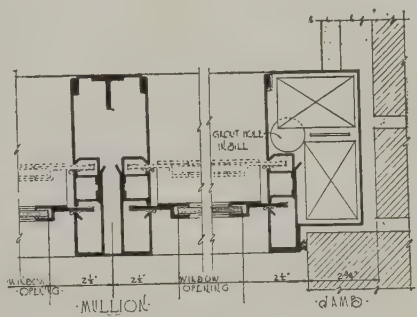
Mullions

Standard Mullions—When two or more windows are used in a single opening, they are generally connected by means of structural tees as illustrated by diagram.



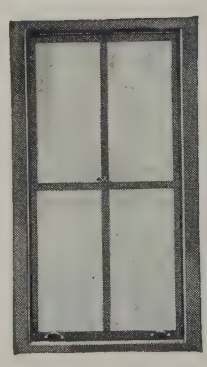
Standard Mullion Detail

Weightless Mullions—Where windows are used in pairs, in a single opening, and a narrow mullion effect is desired, weightless mullion type windows should be specified. In these, the weights and weight boxes between windows are eliminated by means of an ingenious arrangement of sash chains and pulleys which permits counterweighting of the sash from the outside jambs only. See diagram.



Weightless Mullion Detail

Underwriters' Window



Underwriters' Type

The muntins are constructed in two widths with 1¼ and 1¾-in. glazing stops; no single window can be more than 6 ft. wide or 10 ft. high and each light of glass must be limited to 720 sq. in., not less than ¼-in. wire glass. Size 1¾-in. muntins are to be used for windows with lights from 225 to 720 sq. in. of exposed glass area.

Segmental or Curved Head Units

Segmental or curved head units can be provided in almost any radii or design. The inside of this window is finished square to facilitate the use of shades and drapes, and provide for the practical approach of the sash without interfering with the exterior masonry treatment.

Continued on next page

TRUSCON DONOVAN AWNING TYPE STEEL WINDOWS

Correct Shading

Shades are attached to bottom rail of each sash and move in or out with the sash. Consequently, it is possible, by changing angle of the sash, to secure a uniform diffusion of blue skylight throughout the room and, at the same time, eliminate direct glare

Designed by John J. Donovan, a national authority on school architecture, the Truscon-built Donovan Window provides the schoolroom with properly diffused sunlight and accurate ventilation control. Its success in this field has led to the adoption of Donovan Windows for many other types of buildings, such as hospitals, offices and public structures of a similar nature.

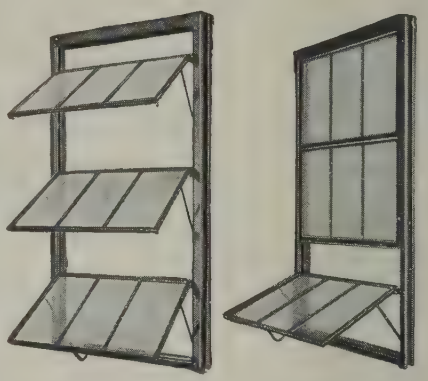
Construction and Operation

The frame opening of the Donovan Window is divided into three sash. These open outward in parallel and do not protrude into the room. Thus, in this design, the ventilating possibilities of each window are 100% of the window opening and, at the same time, can be controlled to any degree. Horizontal and downward drafts are avoided without the usual sacrifice of fresh air by deflecting all air currents upward; and the awninglike operation of the sash protects the interior against rain without necessitating the closing of the windows. Nor does shading impede ventilation, because individual shades are attached to each separate sash and the shade and sash operate as a unit.

Sizes and Types

Plate P-1 below gives dimensions of all standard units including windows made with two sash instead of three. Special units, four lights high, with the top sash fixed and the three lower sash movable, as in the standard types, can be furnished when necessary.

Mechanical operators with KC movable cranks can be furnished with windows intended for use in asylums and similar institutions. (Plate P-3.)



Controlled Ventilation

One or all of the sash may be opened to any angle to deflect breezes and avoid drafts. Move the bottom sash and the upper ones open or close simultaneously; or release a catch and the bottom sash operates independently, leaving the upper sash in any desired position

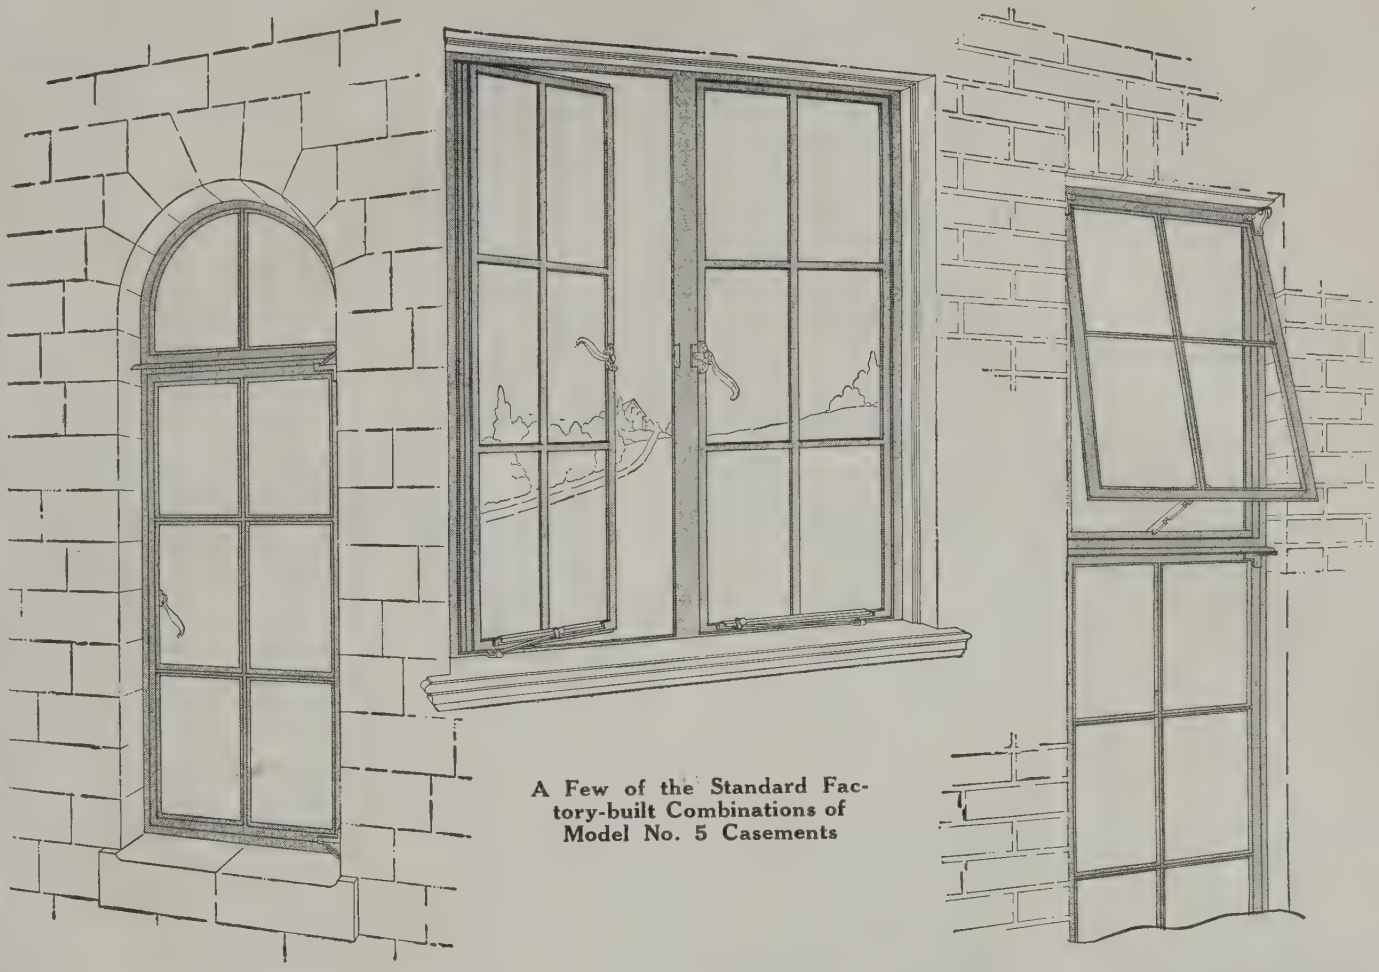
TRUSCON STEEL CASEMENTS AND BASEMENT WINDOWS



A Few of the Standard Factory-built Combinations of Model No. 5 Casements

Truscon Casement Model No. 5

The new single and one-piece combination Truscon Casements, Model No. 5, are substantial in construction, economical in application and distinctive in appearance.

Construction—Sash and frames are fabricated from specially designed hot rolled zee sections that provide a broad, double contact, positive weathering surface. All corners are mitered and electrically butt welded, making the frame members rigid and true. All surfaces of joints between muntins and sash, stiles and rails and intersections of muntins are flush both inside and out. Horizontal and vertical muntins are continuous between stiles and rails, providing further strength and rigidity.

Truscon Casements are equipped with artistically designed malleable iron hardware in a parkerized rustproofed, dead black finish. Solid bronze hardware can be furnished where desired. The use of extension hinges permits cleaning both sides of the glass from the inside.

All casements are painted with a priming coat at the factory and are shipped completely assembled ready to set in the openings, eliminating a lot of costly field labor.

The accompanying plate shows the large variety of standard single, combination and transom units available for openings of any desired size or shape and for use in any type of wall construction.

Truscon Basement Windows

These steel windows for the basement, made in four standard sizes, can be installed in any type of foundation, open and close easily, are readily screened, never stick, leak or need repairs. Furnished complete ready for installation in either shop painted or hot dipped galvanized finish.

Sizes—2 ft. 9⅝ in. wide, 1 ft. 11⅛ in. high; 3 ft. 3⅝ in. wide, 1 ft. 9⅛ in. high; 2 ft. 9⅝ in. wide, 1 ft. 3⅛ in. high; 2 ft. 7⅞ in. wide, 1 ft. 11⅛ in. high.

Met-prod-co Industrial Steel Windows are furnished in standard or special types and sizes, with center pivoted or projected in or out ventilators. Suitable hardware is furnished for operating the ventilators. Mullion bolts and washers are sheradized to prevent rust streaks.

Underwriter's labels can be furnished on either projected or center pivoted sidewall sash.

Mechanical operators can be supplied to operate groups of windows.

Continuous monitor sash are furnished either fixed or operated.

MET-PROD-CO	HEAVY TYPE PROJECTED WINDOWS	DRAWING No. H.C.10

VENTO STEEL SASH COMPANY

INCORPORATED

Puttyless Steel Windows and Steel Bound Screens

MUSKEGON, MICH.

Products

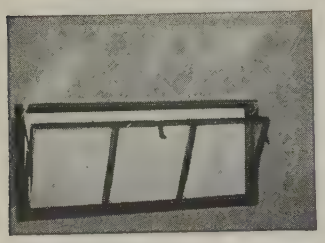
PUTTYLESS STEEL BASEMENT WINDOWS.

PUTTYLESS STEEL FACTORY WINDOWS.

STEEL BOUND BASEMENT SCREENS and FACTORY SCREENS.

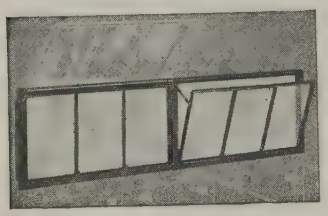
Also Steel Thresholds and Steel Puttyless Coal Chutes. Patented March 4, 1924, U. S. Patent Office. Other patents pending.

Vento Puttyless Steel Basement Windows



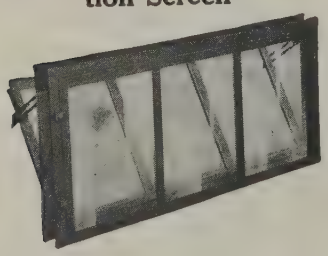
Frame of 12 gauge coppered steel bridge construction, electrically welded at all corners into solid unit 2 in. wide with anchorage fin in center. Jigged square. Sash of 1x1x⅛-in. tee bar, electrically welded at all joints of muntins and corners. Sash opens in at top for ventilation; also lifts up and opens full wide. When open, can be locked at bottom with safety lock. Makes basement secure.

Vento Puttyless Steel Mullion Basement Windows

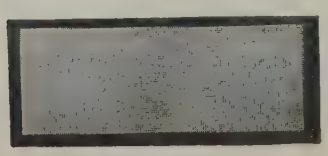


Vento basement window has a ⅝-in. outside watershed at bottom and a ⅜-in. condensation ledge at bottom of pane of glass. All water runs out keeping basement dry. This window does not stick, bind or sag and can be opened in winter, as well as in summer. Open in at top breaks away ice and snow and when open, is safe and all rain and water runs out. The glass is held against a cushion of cork (bed putty) by Vento patented glazing clips which saves contractor and owner cost of putty and glazing. Guaranteed waterproof and weatherproof. Any one can get a pane of glass or fit a screen in place of glass.

Vento Puttyless Steel Storm Window and Combination Screen



Vento steel basement window is fitted with a steel storm sash that can be made into a screen. Being puttyless, the pane of glass is held against the (bed) cord with clips during the winter and a pane-size screen replaces the glass in summer and is held by the same puttyless clips. Can be changed from the basement in a few minutes' time. A storm window is needed in cold weather. Keeps the basement warm and helps keep the house warm.



Vento Metal Bound Outside Screen

Each Vento basement window is drilled and tapped ready to be fitted with a 16-mesh galvanized or copper pane-size screen in regular basement window as well as in storm window.

Vento Metal Frame Pane-size Screens

Vento can also be fitted with a pane-size screen. Remove the pane of glass (puttyless) and replace with metal bound outside screen (16-mesh galvanized or copper wire cloth) or a combination storm and screen sash.

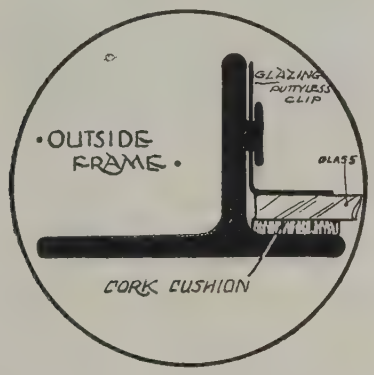
Vento Puttyless Factory Type Steel Window

Patented March 4, 1924. U. S. Patent Office.

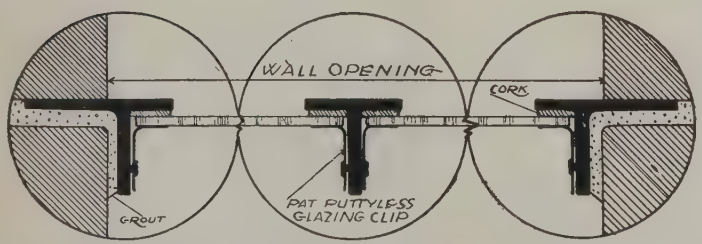
Frame constructed of 1½x1x⅛-in. coppered structural steel tee, electrically welded at each corner making a solid steel frame. Sash constructed of standard 1x1x⅛-in. tee, electrically welded at each muntin contact and at each corner, into a solid unit. Vento being puttyless, each pane of glass is held against a cushion of cork (bed putty put on at the factory) by Vento patented glazing clips, making a weatherproof and waterproof job, saving cost of putty and glazing at first installation as well as replacement.

Any section of window can be ventilated, the opening is top hinged to swing in at top, yet can be lifted open full wide. The frame is tapped and drilled to take a flat outside (16-mesh) galvanized or copper screen. Each pane of glass can be removed and replaced with a pane-sized screen.

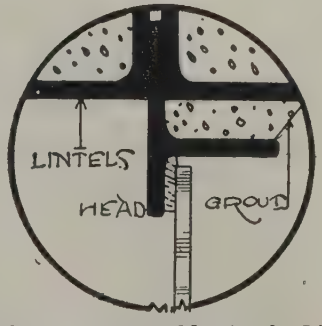
The Vento Puttyless Steel Window gives overhead ventilation, has interchangeable ventilating sections and is especially suitable for creameries, bakeries, ice cream factories, public and private garages and factories. Two or more units can be fastened together by vertical mullion bars. Easy to install and to keep glazed (no putty). Each pane can be removed, washed on both sides and replaced. Specify Vento and have a pleased client for life. There will be no complaint about putty staying soft or glass broken.



Detail of Factory Type Window Frame

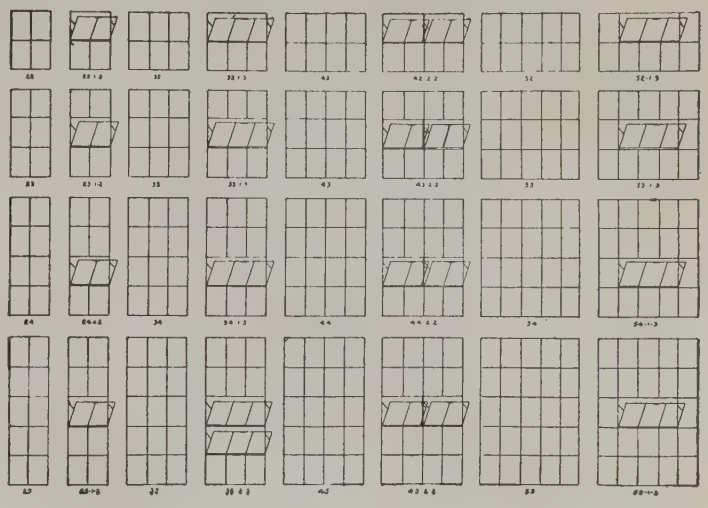


Detail Section Through Jambs and Muntin



Detail at Head Double Angle Lintels

Vento Puttyless Steel Factory-Type Windows —Fixed or with Overhead, Indirect Ventilation Sections as shown.

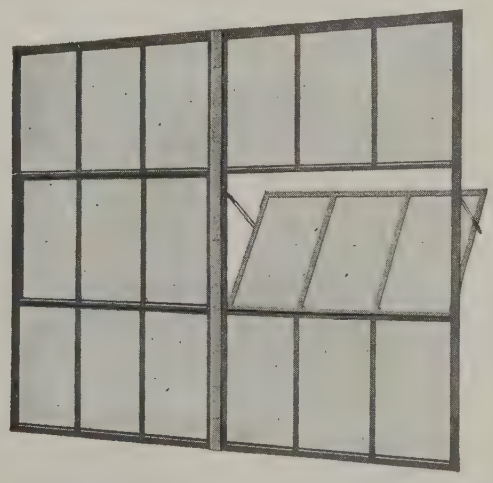


Standard Sash are designed to receive 12x18-in. and 14x20-in. glass. The wall opening dimensions for single units are as follows:

Lights wide	12 in. wide, glass		14 in. wide, glass		Lights high	18 in. high, glass		20 in. high, glass	
	ft.	in.	ft.	in.		ft.	in.	ft.	in.
2	2	7⅞	2	4⅞	2	3	5⅛	3	4⅝
3	3	1	3	7	3	4	6⅞	5	⅞
4	4	1⅜	4	9⅜	4	6	1⅜	6	9⅛
5	5	1¾	5	11¾	5	7	7⅜	8	5⅜
6	6	2⅛	7	1⅜	6	8	8⅝	10	1⅝

Combine any 12-in. wide glass with 18-in. high glass and any 14-in. wide glass with 20-in. glass to get wall opening.

Two or more units may be combined in an opening. The opening size would be the added width of the units plus 2¼ in. for each mullion.



Ventilating Section Opens in 11 Inches

One, two, or all sections may be ventilated

Reed and Fulford Streets
KALAMAZOO, MICHIGAN

Products

VOIGTMANN HEAVY SECTION STEEL WINDOWS, Double Hung.

VOIGTMANN HOLLOW METAL WINDOWS, Double Hung.

Tested and approved as standard by the Underwriters' Laboratories, Inc.

Improved Features

Complete and scientific weatherstripping at all points. Ease of sash operation made possible by use of zinc guides in which sash operate. Cold rolled moulded art metal glazing stops, mitered and welded at the factory and attached with countersunk screws, removed from the inside face of sash, effecting a glazing stop finish in neatness and design not heretofore accomplished. These stops can be arranged for any thickness of glass. Offset plaster bond formed on inside face of jambs and head, eliminating necessity of trim or auxiliary plaster stops. Elimination of all exposed screws and simplified method of hanging weights and adjusting sash. Architecturally correct and neat design throughout combined with smooth finish and excellent workmanship.

Specifications

All material heavy gauge hot galvanized steel, or copper bearing steel or iron, primed one coat gray paint, complete with solid bronze hardware, cast iron sash weights, steel sash chains and labeled by the Underwriters where required. Spring bronze weatherstrips at sills and meeting rails and zinc weatherstrip guides at jambs. Pulleys, removable type, No. 14 gauge steel, hot galvanized; 3-in. wheels, heavily bronze bushed; axles ⅜-in. cold rolled steel. Metal stools, solid bronze window washer's safety anchors, screen guides and metal trim furnished on special order.

Voigtmann Model No. 16 Double Hung

Sash No. 14 gauge, pulley stiles, sills and heads of No. 16 gauge, weight boxes of No. 20 gauge.

Voigtmann Model No. 14 Double Hung

Voigtmann Model No. 24 Hollow Metal Window

This window possesses the same Voigtmann quality and the many other desirable features of the Model No. 12 window. It was developed to meet the demand for a lower cost window without a sacrifice to strength and durability. Although possessing neat members, its strength is provided for by the number of correct reinforcing bends made in the metal during the forming operations. This model is a pleasing type, architecturally correct, and permits a maximum of glass area. Sills are made of No. 14 gauge and all frame and sash members are made of No. 24 gauge, tight coated, hot galvanized steel. The sash weights are hung with extra heavy steel chain. Sash operate easily and are weathertight.

Hardware

These specifications apply to both Model Nos. 12 and 24: Voigtmann special removable pulley, sash lock, lifts and pole socket. Furnished either in solid bronze or malleable iron, plated. Special hardware furnished if desired.

Bronze and Copper Windows

All models can be furnished in cold rolled bronze or copper.

Installations

On these two pages we show illustrations of two important installations of Voigtmann windows during 1928. Many other equally important installations have been made throughout the United States and a more complete list will be sent upon application.

The Company

The Voigtman Metal Window Corporation was the first to make metal windows and now offers the experience of thirty-five years of continuous, successful manufacture. The plant facilities and grade of skilled workmen employed are such as to guarantee the highest grade of product and deliveries according to schedule. An opportunity to estimate your work will be given prompt and careful attention.

THE WILLIS MANUFACTURING COMPANY

INCORPORATED 1891

Manufacturers of Hollow Metal Windows and Tin Clad Fire Doors

HOME OFFICE and FACTORY

GALESBURG, ILL.

Products

HOLLOW METAL WINDOWS, Heavy and Light Gauge; TIN CLAD FIRE DOORS and Hardware.

Approvals

All types of Willis hollow metal windows and tin clad fire doors have been tested and accepted as standard by the National Board of Fire Underwriters.

Hollow Metal Windows

The Willis hollow metal window is made in all types, including double hung, single pivoted, double pivoted, top hinged, casement and stationary. Double hung with pivoted, hinged or stationary transoms.

Our approved mullion may be employed when it is necessary to use more than one single unit in an opening.

Tin Clad Fire Doors

Two-ply and three-ply, wood core, tin clad doors of the sliding or swinging type for any kind of opening.

Specifications for Hollow Metal Windows

All hollow metal windows shall be those manufactured by THE WILLIS MANUFACTURING COMPANY of Galesburg, Ill., or such other make that will comply in every respect with their design and construction.

Metal used throughout shall be No. 24 gauge tight coated galvanized, as required by the Underwriters' Laboratories, Inc., and shall be copper bearing. Heads, jambs and all sash rails shall be constructed of one piece of metal each, excepting back covers. All covers to be carefully and securely locked to their respective members. Heads and jambs shall have a moulded brick or staff bead and shall be properly constructed for building into brick, stone or terra cotta walls. All members must be carefully formed and miters neatly cut, lapped and riveted. Where two sash members lap on an exposed surface, the under member shall be offset the thickness of the metal to permit of a smooth and even surface to insure perfect operation of sash.

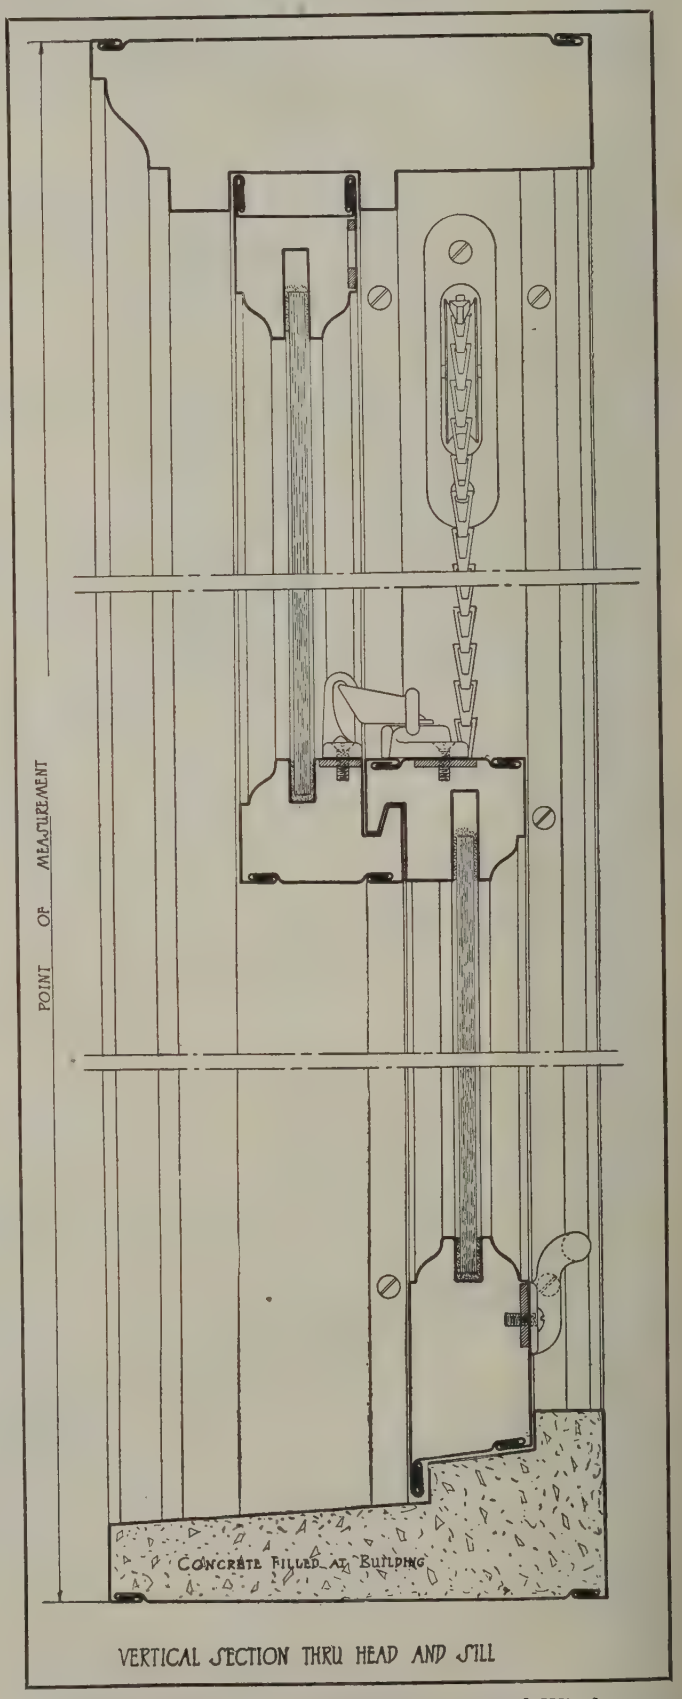
Pulley stiles shall each be formed accurately to provide for a perfect operation of the sash. Each jamb to have a weight pocket of ample size to permit of easy application of the sash weights. Weight pockets to have a removable cover which will fit tight and which will not offer obstruction to the sash in their operation.

Sash rails to be neatly mitered and riveted. All sash to be carefully fitted into the frames at the factory to insure perfect operation and a weathertight job. Meeting rails to lock tightly together when both sash are closed to insure strength and weathertightness. Glass rabbets on all side and bottom rails to be ¾ in. deep and on top rails 1½ in. deep. Sash to be divided with muntin bars into lights as required by the Underwriters' Laboratories, Inc., or as shown on the plans. Muntins to have removable caps to permit of glazing without removing sash from the frames. The outside section of the muntin to be securely fastened to the sash rails by rivets and reinforced every 12 in. with a steel, tapped plate. The inside muntin section to be secured to the outside section by means of screws passing through the reinforcing plates. Both sections of the muntin to be moulded to conform with the sash rails.

Hardware to consist of substantial ball bearing pulleys fastened in place in the jambs by means of screws passing through plates riveted on the inside of jambs. Sash shall be hung on heavy sherardized sash chain, approved by the Underwriters' Laboratories, Inc., and counterbalanced with sectional weights. All pulleys shall be placed in jambs in such a manner that they may be removed and replaced without disturbing other parts of the window. Sash shall be equipped with pole socket, bar lifts and underwriters' approved malleable iron lock, dead black, bronze or brass plated finish. Plates to be attached inside sash rails with rivets for attaching hardware. Sash shall be glazed with ¼-in. wire glass (specify kind) thoroughly embedded in putty. All metal shall have one shop coat of an approved metallic paint before leaving the factory.

All windows shall be constructed in accordance with the specifications of the National Board of Fire Underwriters and shall meet their requirements in every respect. All windows shall bear both Underwriters' and manufacturers' labels.

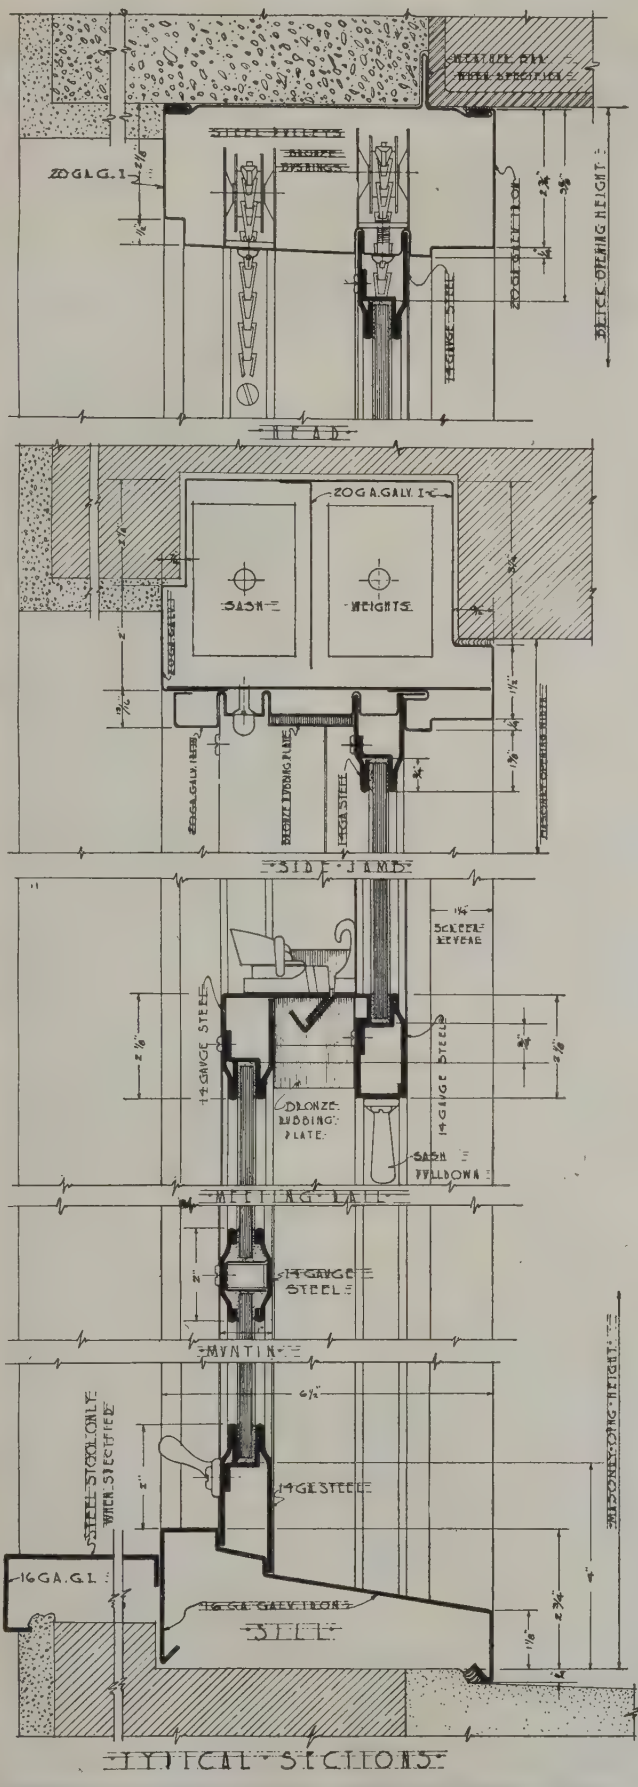
Note: In sending in specifications be sure to furnish all necessary information such as type of window wanted, brick opening size, style of head, whether square or segment, division of glass in sash and kind of glass wanted.

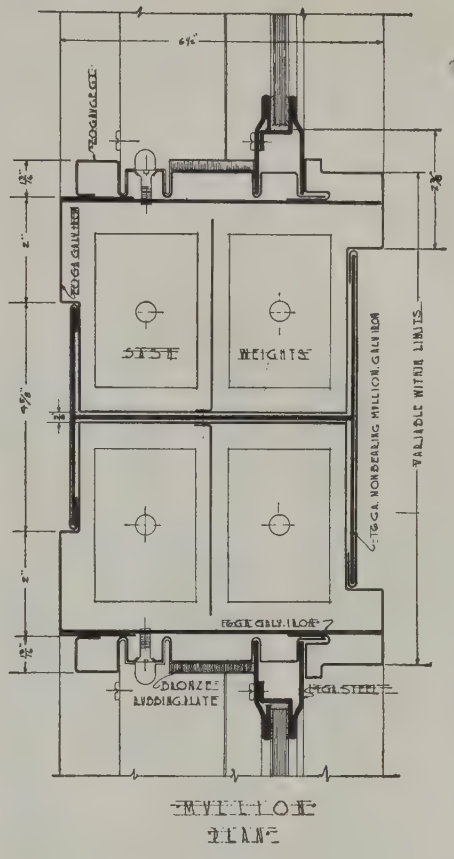


VERTICAL SECTION THRU HEAD AND SILL

Details Willis No. 24 Gauge Hollow Metal Window

Continued on next page





Willis Paramount Solid Steel Window, Double Hung Sash

Materials—All as indicated on detail drawing, sills of No. 16 gauge galvanized iron, jamb and head members of No. 20 gauge galvanized and sash of No. 14 gauge soft rolled strip steel.

Pulleys are heavy steel wheels with bronze bushings and ⅜-in. steel axles with No. 16 gauge housings.

Chain is galvanized and attached to sash and weights with galvanized fittings.

Solid bronze rubbing plate on each jamb at ends of meeting rails to insure tight fit.

Finish hardware may be solid bronze, or iron, bronze plated as desired. Each opening is equipped with one lock, two bar lifts and one pull on underside of lower rail of top sash. Weights are cast iron of size to properly counterbalance sash.

Assembly—All frame members are fastened together with butt joints reinforced with plates. All sash joints are mitered and welded. Glazing strip is fastened to sash member with screws as indicated on detail.

Finish—All parts receive a coat of the best grade priming paint on inside and outside before shipping.

Underwriters' Labels—When desired, window will be made according to the specifications of the Underwriters' Laboratories, Inc., and their labels attached.

"Fitrite" Skylight Gearing and "Fitrite" Bronze Strainers

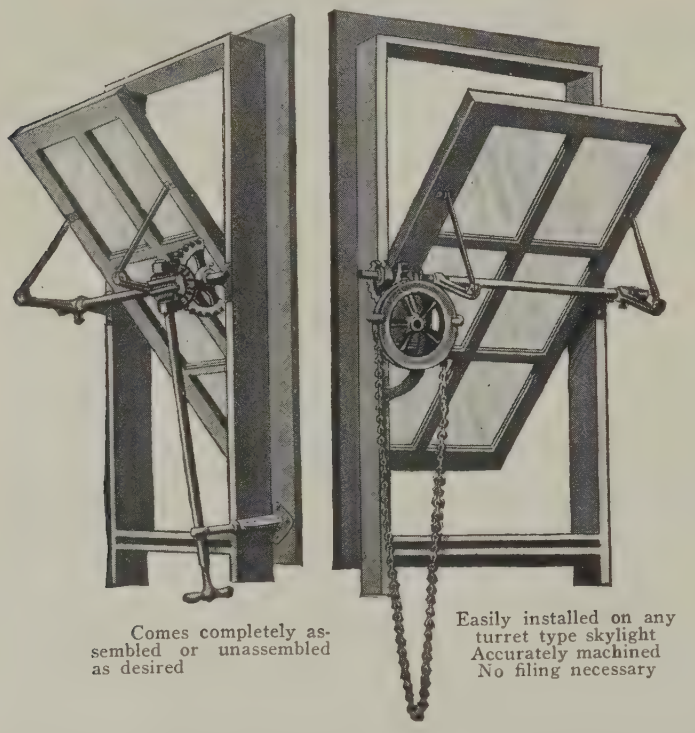
TELEPHONE
CHELSEA 2400

542 West 23rd Street
NEW YORK, N. Y.

For Adjustable Pipe Snow Guards and One-piece Ornamental Leader Straps, see page A505

"Fitrite" Skylight Gearing

Features—Instead of the usual round pipe holes (where the only point of contact is at the setscrew),



Comes completely assembled or unassembled as desired

Easily installed on any turret type skylight
Accurately machined
No filing necessary

"Fitrite" Skylight Gearing has special oval pipe holes on arms and lifting gear.

The result is a much firmer grip (contact at *three* points instead of one) and absolute freedom from rattling in any position.

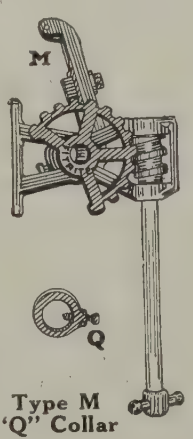
Material—Made in both best quality gray iron and in solid bronze, which is rustproof and harmonizes with copper skylights.

Sizes—Made for standard ½-in. pipe size.
Also furnished for ⅜-in. and 1-in. pipe sizes.

Type "M"—For single sashes or concrete work. Type "M" requires no horizontal piping. It is therefore suitable for small skylights with single sashes.

Type "M" requires no extensions, thus eliminating the problem of fastening extensions to concrete walls.

"Fitrite" Bronze Gearing—Is especially recommended (1) for industrial buildings as it resists corrosion due to chemical fumes, acids, etc., (2) for laundries, kitchens or wherever excessive moisture causes iron to rust away. The slight extra cost of "Fitrite" Bronze Gearing assures a permanent trouble-free job.



Type M
"Q" Collar

"Fitrite" Roof Strainers—for Flat Roofs Having Inside Cast Iron Leaders

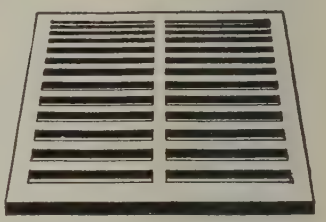
Type F—Perfectly flat. Extensively used for roofs and roof gardens requiring freedom from all obstruction; also for swimming pools.

Type R—The slight crown (1 in. high) does not seriously obstruct the roof, yet the construction is such that debris slides off easily. Especially recommended for flat tile or slag roofs having inside leaders, at center of roof.

Type X—Recommended where drainage efficiency is the prime consideration. The extra high crown (3½ in.) and narrow slits effectively keep out gravel, sticks, etc. Type X is especially desirable where leaders are at edge of roof.

Materials—All types made in solid bronze.

Features—"Fitrite" bronze strainers are about ¼ in. thick, will not rust, and are practically unbreakable—will easily support the weight of three husky men. Each strainer has two hinges allowing easy attachment by copper strip to leader box.



Type F

Sash Operating Devices.

Also manufacturers of: Simplex Transom Lifter, for all types of transoms; Casement Adjusters, friction, geared, and thumbscrew control for all types of casement sash; Signal Sash Lock, for double hung windows; No. 49 Harris Concealed Transom Lifter, for transoms where concealed device is required.

Types of Payson Sash Operating Devices

Torsion Type Using Levers to Sash—Ideal, chain control, for pivoted sash.

Superior, hand wheel control, for pivoted sash.

Triumph, hand wheel control, for pivoted sash in monitors, also for store front transoms.

Torsion Type Using Racks and Pinions to Sash—Reliance, chain or hand wheel control, either straight or curved rack, for top hinged or heavy pivoted sash.

Gem, for single top hinged, skylight sash, chain control.

Star, for single top hinged skylight sash, pole control.

Screw Type Using Levers to Sash—Crown, for short runs of bottom hinged sash opening in.

Duplex, for heavy transoms.

Signet (new), for long runs of hinged sash opening in or out.

Tension Types—Peerless, chain control for top hinged continuous steel sash.

Victor chain wheel control for vertically pivoted sash.

Monarch, for short runs of vertically pivoted or side hinged sash.

All types furnished with electric equipment if desired.

Payson Products Give Satisfaction

This list of Payson products is selected with the hope that it may be used freely by architects in writing specifications. The list contains standard articles that are guaranteed to give perfect satisfaction.

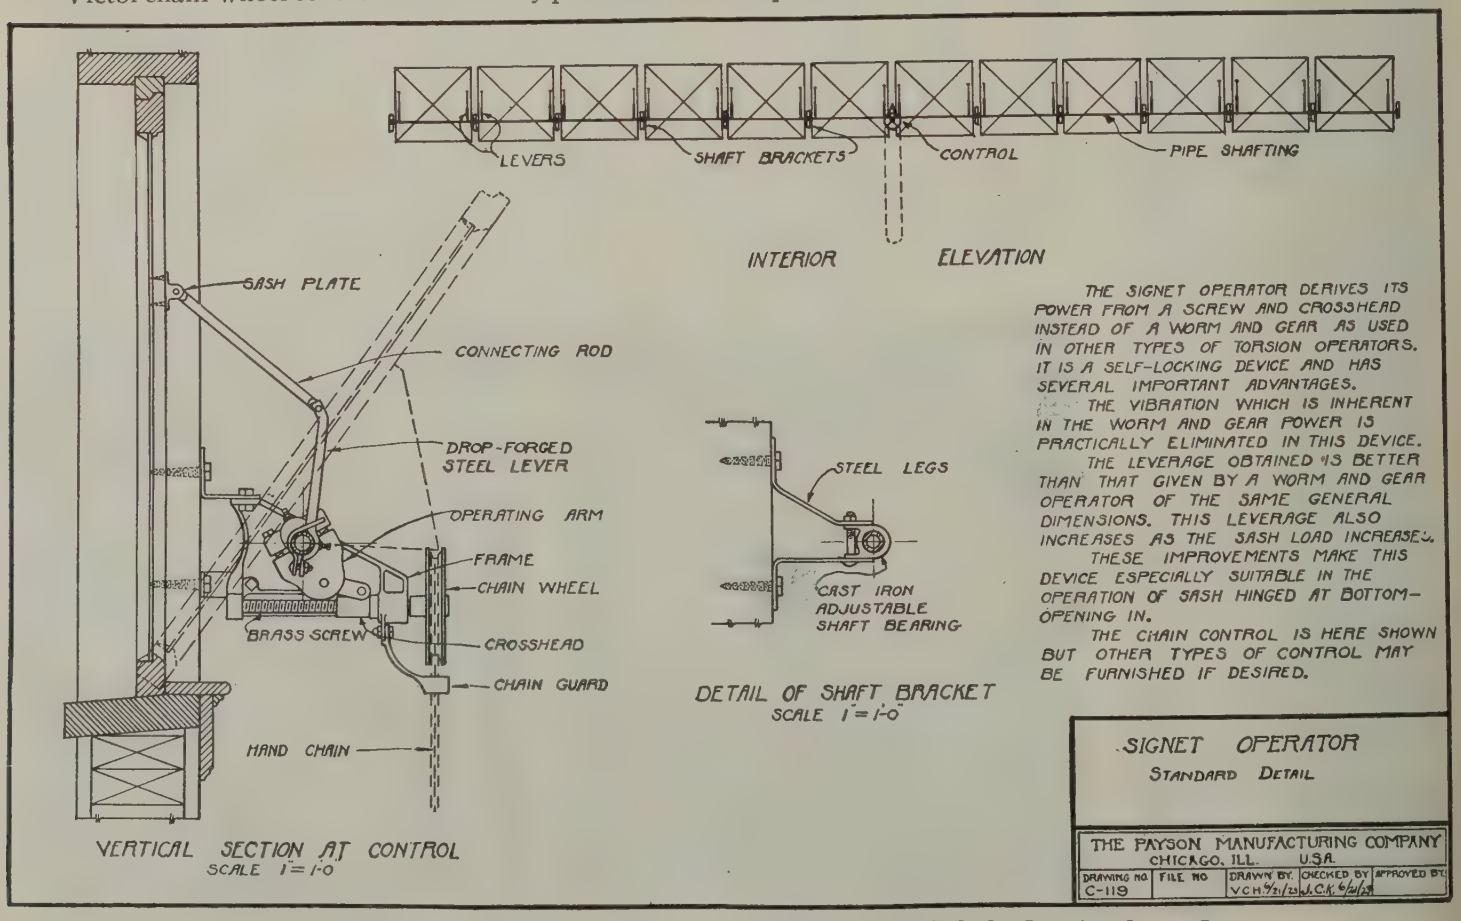
Service

Payson sash operating devices are made to order, using measurements taken from the plans and checked at the building. Every job is exhaustively studied by Payson engineers, and a drawing showing the scheme thought most satisfactory is prepared and submitted to the architect for approval as to layout and general design. After this approval is obtained, if there is any question as to measurements, drawings are forwarded to the building to be checked.

Time is really saved in this way, because the operators can then be erected from the blue print with the certainty that every part will fit the place for which it is intended.

Catalogue

We have a very complete catalogue of Payson products which we would be glad to forward on request.



Detail of Signet Operator for Use on Top or Bottom Hinged Sash, Opening In or Out

Continued on next page

THE PEERLESS A OPERATOR IS INTENDED ESPECIALLY FOR THE OPERATION OF TOP HINGED CONTINUOUS SASH.

THE OPERATOR STATION IS AN OIL TIGHT BOX CONTAINING A HARDENED STEEL WORM AND BRONZE WORM GEAR. THE WORM SPINDLE IS EQUIPPED WITH THRUST BEARINGS. A CAST RACK AND A CUT STEEL PINION TRANSMIT THE POWER FROM THE OPERATOR BOX TO A HORIZONTAL SLIDING SHAFT.

THE ELECTRIC MOTOR IS APPLIED TO THE OPERATOR BOX MAKING A COMPACT EFFICIENT UNIT. MACHINE CUT SPROCKETS AND SILENT CHAIN ARE USED FOR SPEED REDUCTION.

THE SHAFT IS SUPPORTED BY ROLLER BRACKETS ATTACHED TO THE TRUSSES AND TO INTERMEDIATE STEEL MEMBERS. THE LIFTING ARMS ARE ATTACHED TO THE BRACKETS AND ARE ARRANGED SO AS TO ELIMINATE ALL LATERAL THRUST ON THE SASH. ALL SWIVEL POINTS ON LIFTING ARMS HAVE BRASS WASHERS AND THE ROLLER BRACKETS ARE FITTED WITH BRASS SLEEVES.

DIAGRAMS WILL BE FURNISHED WHICH WILL GIVE THE ELECTRICAL CONTRACTOR COMPLETE INFORMATION REGARDING THE NECESSARY WIRING AND CONTROL SWITCHES REQUIRED.

THE RACK AND PINION OPERATOR AS SHOWN ON THIS PAGE IS THE MOST POWERFUL OF ALL DEVICES COMMONLY KNOWN AS THE TORSION TYPE. THE LEVERAGE IS SO REDUCED THAT THE TORSIONAL STRAIN ON THE OPERATING SHAFT IS VERY SLIGHT.

ITS SIMPLICITY OF ACTION MAKES ITS USE ADVISABLE WHEREVER THE WORK TO BE DONE COMES WITHIN ITS LIMITS.

THE TYPES SHOWN HERE COVER IN A GENERAL WAY PRACTICALLY ALL OF THE CONDITIONS ON WHICH THE DEVICE MAY BE USED TO ADVANTAGE. IN SELECTING THE TYPE DESIRED THE GOVERNING FACTOR IS AMOUNT OF DUTY TO BE PERFORMED. THIS IS BASED ON THE LENGTH OF RUNS, WEIGHT AND STYLE OF SASH AND LOCATION IN BUILDING.

ALLWEATHER VENTILATOR COMPANY, INC.

Manufacturers of "Wurldsbest" Window Ventilators

452 Lexington Avenue

NEW YORK, N. Y.

DEALERS IN ALL LARGE CITIES

The "Wurldsbest" Window Ventilators

"Wurldsbest" window ventilators are stormproof, draftproof, dustproof and insectproof. Planned by a well-known construction engineer these ventilators literally transform a room from the hour they are installed. Every trace of "stuffiness" vanishes—the atmosphere of the whole room changes and becomes as delightfully fresh, airy and invigorating as in summertime.

Special Features of "Wurldsbest" Ventilators

Hooded Opening—Admits the air yet breaks up the direct air currents and excludes all drafts, rain and snow.

Built-in Screen—Completely covers the entire opening and not only excludes insects but keeps out approximately 80% of the street dust, soot, etc.

Adjustable Ends—Which telescope into the body of the ventilator make it fit any window within the limit of the size selected.

"Wurldsbest" Ventilators Are Strongly Constructed

"Wurldsbest" ventilators are made of 20-22 gauge, terne plate sheet steel. The series of hooded openings are stamped into the steel. These not only provide for admission of the air but materially stiffen the body of the ventilator.

The entire opening in the ventilator is covered with 18-mesh copper bronze wire screen which is permanently built into the body of the ventilator.

Beautifully Finished

"Wurldsbest" ventilators are finely finished in olive green enamel baked on. This makes a beautiful and durable finish. It also thoroughly protects the metal from the action of the elements. "Wurldsbest" ventilators can be used the year round.

They can be supplied in other colors to order at slightly additional cost.

Sizes

All "Wurldsbest" ventilators are made 9½ in. in height and in 7 lengths for windows of various widths, as follows:

	Retail Price
No. 2 —to fit windows 15 to 23 in. wide	$2.50
No. 3 —to fit windows 23 to 30 in. wide	3.00
No. 4 —to fit windows 30 to 36 in. wide	3.50
No. 5A—to fit windows 36 to 46 in. wide	4.00
No. 6A—to fit windows 46 to 58 in. wide	4.75
No. 6B—to fit windows 58 to 63 in. wide	5.00
No. 6C—to fit windows 63 to 72 in. wide	5.50

Exterior View Showing One of the Adjustable Telescopic Ends

Installation

"Wurldsbest" ventilators are installed on the parting strip either at the bottom or top of the window or both as desired. Each end piece has a cut out slot near the top which fits over a round head screw that is placed in each parting strip. This allows the ventilator to be easily attached and removed. The sliding end pieces make a snug fit.

Since the ventilator is attached outside, the lower sash of the window can be closed completely or opened wide when desired without removing the ventilators.

PRAIRIE WINDOW VENTILATOR CORP.

Manufacturers of Metal Window Ventilators

141 Georgia Avenue, PROVIDENCE, R. I.

NEW YORK, N. Y., Room 611, Graybar Building

BOSTON, MASS., Room 428, Statler Building

Prairie Sliding Sash Window Ventilator

The Prairie Window Ventilator is a simple, practical and scientifically constructed device that renders perfect ventilating service in homes, offices and public buildings. No drafts, stormproof, volume of fresh air under control—*makes the open window safe.*

It can be easily installed in any vertical sliding sash window and can be easily and quickly removed.

An adjustable slide, moving up or down, regulates the opening and closing of the pivot louvers and controls the air flow through the ventilator. It is rainproof and stormproof. A lateral adjustment of from 10 to 20 in., depending on the size, makes it possible to fit any window requirement. Made in 8, 12 and 18-in. heights and 5 adjustable widths.

Tin coated steel sheets, "Follansbee Forge," are used in construction of this type, finished in baked enamel, white, old ivory, gray, green, brown, or biege.

Industrial Steel Sash Window Ventilator

The Prairie Industrial Sash Ventilator is installed like a light of glass. It is made in standard sizes to fit the steel frames. Simply remove a light of glass and place the ventilator with the screen facing against the frame, insert wire springs or clamps as with glass, and putty same as regular glazing.

Industrial type is made of galvanized iron 28 gauge (not steel), assuring ample strength for rough abuse and is finished in brown or gray baked enamel, harmonizing with the plant appearance. Fine mesh, rustless screens, cut to exact size, are furnished with each ventilator, making it insectproof.

Made in two standard sizes, 12x18 and 14x20 in., or special sizes made to order.

This ventilator has the louver or shutter adjustment for controlling the air movement similar to the sliding sash type of ventilator.

FRANK B. PERRY, INC.
ENGINEERS AND ARCHITECTS
44 FRANKLIN ST., PROVIDENCE, R. I.

Job No. 532
Subject, Brier Mfg. Co.

April 20, 1928.

Prairie Window Ventilator Corp.,
141 Georgia Avenue,
Providence, R. I.
Attention Mr. C. I. Bigney, Pres.

Dear Sir:

In connection with the design for the three story reinforced concrete Nemo Building, to be occupied by the Brier Manufacturing Company and the Little Nemo Manufacturing Company, at the corner of Ship and Richmond Streets in this city, we made a thorough study of various window ventilators on the market.

With steel sash in cold weather the condensation of moisture on the interior surface of the glass is a source of annoyance. After some experiments, we decided that it would be advisable to install one Prairie Ventilator in place of a 14x20-in. light of glass in each sash, to not only prevent condensation but to have a source of ventilation which would be adequate and within the control of the operatives occupying the space adjacent to the windows at the work benches and elsewhere in the factory.

The experience which has been obtained on a smaller scale in another industrial building similarly equipped confirms our judgment in recommending the installation of three hundred of your Unit Sash Ventilators in the Nemo Building.

Yours truly,
FRANK B. PERRY INC.

Mr. C. I. Bigney,
Prairie Window Ventilator Corp.,
141 Georgia Ave.,
Providence, R. I.

My dear Mr. Bigney:

We would like to express our delight and pleasure over the service rendered by your Prairie Window Ventilator.

Where formerly it was almost impossible to keep men at our hot pressing machines, we have replaced them entirely with girls at an enormously increased output and superior work due to the perfect ventilation, caused by your ventilator. Ever since one of our men died with pneumonia caused by draft through an open window, although it was summer time, we had been sorely beset by our ventilating problems until you installed your ventilators.

We recommend these ventilators highly to everyone visiting our plant, and you no doubt have had orders from them from time to time.

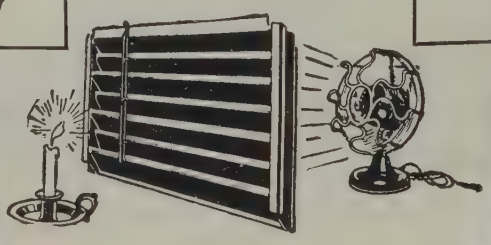
Trusting that you're meeting with the best of success in the marketing of this article, I am,

Sincerely,

JD:AO

On your street TWICE every day

Residential Installation



Proof That the Prairie Prevents Drafts

The simple candle test illustrated here proves *conclusively* that there is no possibility of a draft when the *Prairie Window Ventilator* is used. When the fan is turned on directly in front of the ventilator, the flame of the candle is not blown out, but is attracted toward the ventilator by the upward deflection of the air. The air is forced through the ventilator directly up toward the ceiling

Window-Wall Sleeping Porch, in Use More Than Ten Years in Home of W. R. Metcalf, Marietta, Ohio

Mr. Metcalf Says: "I would give up the rest of the house before I would my Window-Wall Sleeping Porch. We sleep in the fresh air every night, regardless of the weather and the Window-Wall is the only thing I ever heard of that will permit of this and at the same time give you proper protection. I am strong for the Window-Wall."

Window-Wall Unit

The Window-Wall Unit is a combination of screen, glass and "Airolite" Ventilating Sash, ideal for sleeping porches, fresh air bedrooms and sun parlors, both in private homes and institutions. Affords protection, ventilation, privacy, comfort, convenience and health to the occupants of any room in which it is installed, and the original cost is only slightly more than the cost of an ordinary window. With Window-Wall, no awnings, inside window blinds or drapes are necessary. In other words, with Window-Wall you live outdoors with indoor protection. It is installed practically the same as an ordinary window.

Window-Wall Unit with Double Hung Sash as It Appears When Installed

The Window-Wall Unit consists of a wooden frame, a screen which is hung on the outside, a set of glass sash, a set of "Airolite" Adjustable Ventilating Sash and a tuck-a-way pocket with hinged sill. When the glass and "Airolite" Sash are lowered into the tuck-a-way pocket, a screened opening effect is obtained.

With the glass sash run up into place, you have a regular window or sun parlor. With the "Airolite" Sash raised and the glass sash lowered you have an all-year, open air, sleeping room. Both glass and "Airolite" Sash can be run up into place at the same time. By this arrangement the "Airolite" Sash serves as an awning or shade. The steel louvers can be tilted or adjusted to keep out excessive sunlight and at the same time retain absolute privacy.

Suggested Window-Wall Specifications for Architects' Use

(For insertion in Carpentry section.)

Specifications vary with the designs and construction desired. The following specifications cover all items, which may be segregated and used to specify construction for double hung windows:

Where indicated on the plans, the [Carpenter] [Contractor] shall furnish and install Window-Wall Units as manufactured by THE AIROLITE COMPANY, Marietta, Ohio.

Each Window-Wall Unit as shipped by the manufacturer shall consist of a substantially constructed wood framework built with window openings, each unit built up by framing pulley jambs (with pulleys, outside blind stops and parting stops), head jamb, weather pan board and copper weather pan in the proper manner. This does not include any interior or exterior trim.

The following material shall be furnished by the manufacturer and be installed by the [Carpenter] [Contractor].

One pair double hung, metal louvered "Airolite" Adjustable Ventilating Sash (louvers to be finished in standard baked enamel paint, olive green color; frames, three coats air-dried enamel paint, olive green color).

One pair double hung glazed sash, one full length copper wire screen, outside sill, hinged sill, inside sill, sash weights and weight guides.

One pair sill hinges, one pair copper drain tubes and one set full length screen hangers.

The [Carpenter] [Contractor] to leave proper openings to receive Window-Wall Units and to furnish all labor and material required to install these units in first class workmanlike manner and in line with all exterior and interior construction.

Continued on next page

Detail Drawings of Window-Wall Units

The details in the next column are for frame construction, also for stucco if 1⅛-in. casing is used. For casement windows, brick or other construction write for detail drawings.

STANDARD SIZES OF WINDOW-WALL UNITS

Widths

Glass size, in.	Over-all glass sash, in.	*Over-all clearance required between studding or structure opening, in.
20 in.—One-light wide	24	31¾
22 in.—One-light wide	26	33¾
24 in.—One-light wide	28	35¾
26 in.—One-light wide	30	37¾
28 in.—One-light wide	32	39¾
30 in.—One-light wide	34	41¾
32 in.—One-light wide	36	43¾
18 in.—Two-lights wide	41	48¾
20 in.—Two-lights wide	45	52¾
22 in.—Two-lights wide	49	56¾
24 in.—Two-lights wide	53	60¾

**Note:* For brick construction, etc., where weight boxes are required, add 1½ in. to the above dimensions on over-all width clearance required.

Mullion Casing: When the Window-Wall Units are to be installed with mullions between units, the ground casing and finished interior casing fitting between the units will each be 10¾ in. wide. This will be increased by 1½ in. when used in brick or masonry walls.

Heights

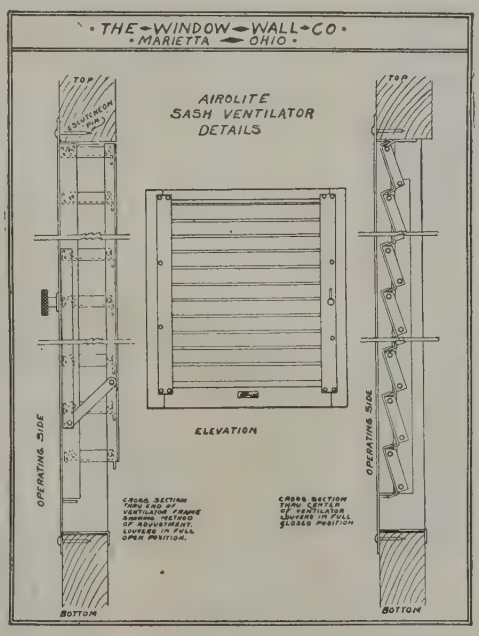
Glass size, in.	Over-all glass sash, in.	Floor line to top of inside sill, in.	Over-all clearance required between floor line and headers, in.
20	46¾	31 1/16	78 5/8
22	50¾	33 1/16	84 5/8
24	54¾	35 1/16	90 5/8
26	58¾	37 1/16	96 5/8
28	62¾	39 1/16	102 5/8
30	66¾	41 1/16	108 5/8

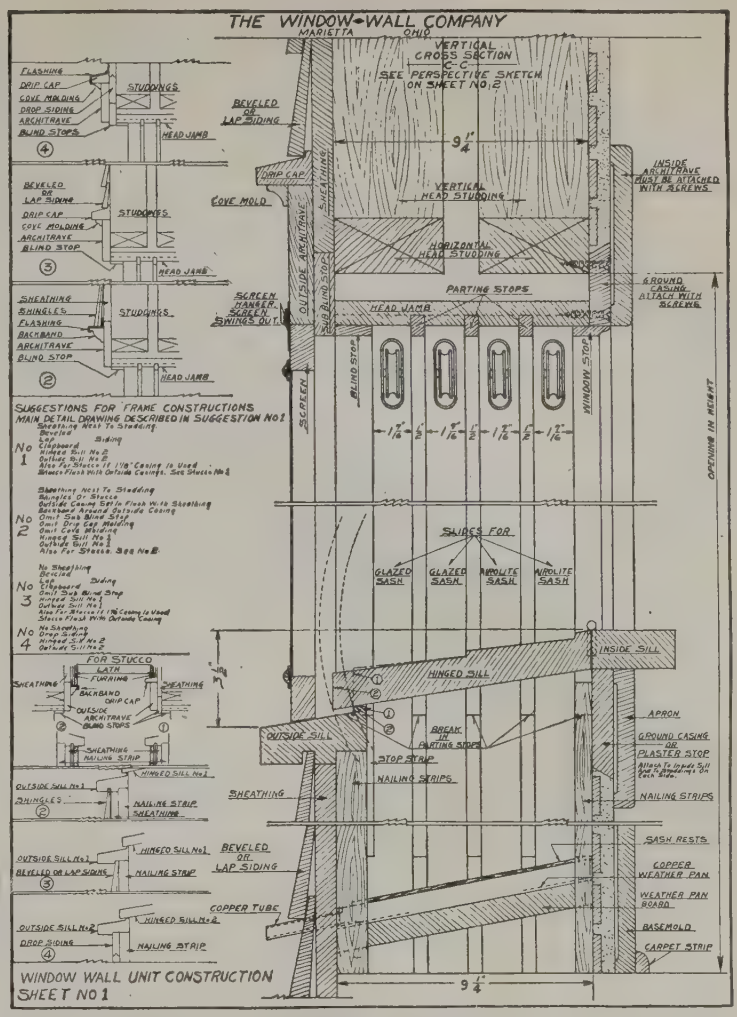
Caution: The above dimensions cover the actual openings required to receive the Window-Wall Unit. Take care of top and side trim.

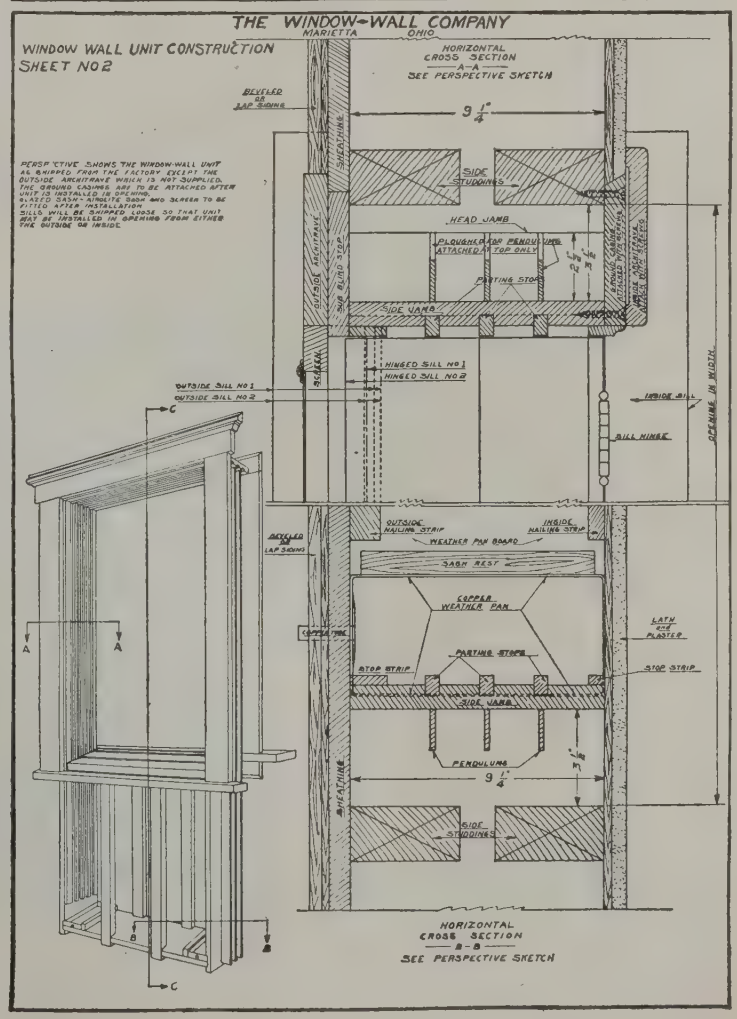
"Airolite" Ventilating Sash, Glazed Sash and Screen are the same in width.

"Airolite" Sash, an All Weather Sash

"Airolite" Sash is a patented ventilator constructed with wood frame and adjustable louvers, made of rust resisting steel, each louver having a ¼-in. flange. A slight pressure of the thumbscrew sets the louvers at any desired angle, quickly and silently, thus affording privacy, shade or light as desired, fresh air without draughts and protection against storms. While "Airolite" Sash is used as part of the Window-Wall Unit it can be installed as a separate unit in old and new construction as ordinary double hung glazed sash, as full length screen, or as half sash to fit against outside blind stops and flush against upper glass meeting rail; the bottom to rest upon the main sill. "Airolite" Sash can be supplied with or without screen. When screen is desired, we use 16-mesh copper wire cloth. On large sizes, the "Airolite" Sash is divided up into various size lights.







AMERICAN DISTRICT TELEGRAPH COMPANY

Central Station Protection Service and Electric Signaling Systems

EXECUTIVE OFFICE

183 Varick Street, NEW YORK, N. Y.

For complete list of A. D. T. Service and Central Offices, see page C3566

For A. D. T. Watchman's Compulsory Tour, Fire Alarm, Sprinkler Supervision and Proprietary Systems, see pages C3566-3567

Phonetalarm—A. D. T. Bank Vault Protection Systems (Approved Grade-A)

The Phonetalarm provides a system of bank vault protection operating on the sound detection principle. Protection is provided by means of microphones or detectors installed on the ceiling of the vault. Any attempt to force an entrance into the vault necessarily results in certain noise. This causes the diaphragms of the detectors to vibrate with a resulting effect upon certain instruments which cause the alarm to operate.

The system is effective against attack by means of hammering, drilling, burning or explosion. A sharp blow on the vault wall or any part of the vault structure will cause the alarm to sound; it will not operate from sounds originating elsewhere on the premises. Vault door and bolts are provided with protection contacts so that an alarm will be given upon any attempt to open the vault prior to the prescribed opening time.

The simplicity of Phonetalarm construction makes it possible to install a system without inconvenience in a vault already erected as well as in vaults under construction. The devices are always accessible, so that repairs and adjustments can be made at any time without difficulty. The Phonetalarm is less expensive to install than any other type of system, yet it has an unusual value from a protection standpoint.

The A. D. T. Phonetalarm is the original sound detection system, the first system having been installed by A. D. T. engineers in 1914. Since that date, scores of banks throughout the country have installed the Phonetalarm, including many Federal Reserve Banks and other large banking institutions. This system has the approval of the Underwriters Laboratories, Inc., and is listed as Grade "A," thus securing the maximum discount on burglary insurance premiums.

A. D. T. Central Station Phonetalarm

Under Central Station operation the Phonetalarm System is given continuous supervision. All alarms are responded to immediately by men especially trained for this service. A careful check is maintained on the opening and closing of the vault and it cannot be left open or be reopened after the usual closing hour without causing an investigation.

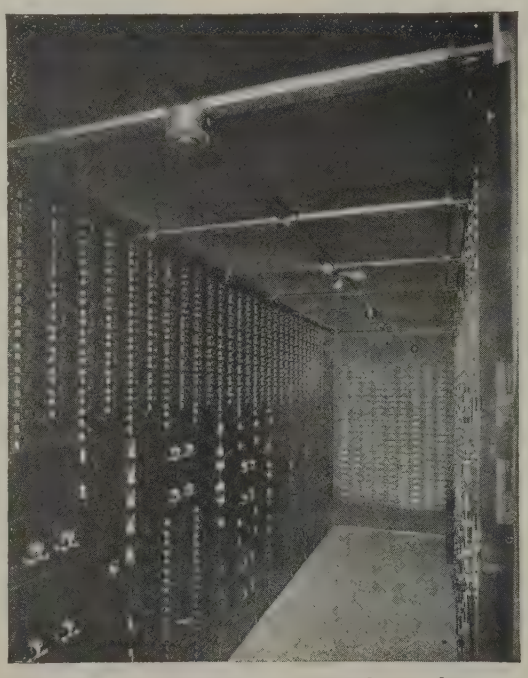
Each Phonetalarm System is connected to the Central Station by means of an individual wire. This is under constant supervision and cannot be opened, shorted or grounded without detection by Central Station operators.

The Phonetalarm detectors are tested periodically during the closed period by means of a sounding device within the vault which is operated from the Central Station. This simulates an alarm condition and the signal received in the Central Station is identical with one originating from an attack on the vault.

Service is an important item in Central Station operation and all systems are carefully inspected and tested periodically in order to assure perfect operation. Skilled repair men are constantly on duty to render service in the event repairs are necessary.

Central Station Phonetalarm may be secured in all cities where A. D. T. Central Stations are maintained.

For complete list, see page C3566.



Typical Phonetalarm Bank Vault Installation

Local Bank Vault Phonetalarm

Designed for installation anywhere without restriction as to location. Consists of Phonetalarm detectors and control equipment together with apparatus for providing an alarm locally. The alarm device is an 18-in. loud ringing bell installed in a protected steel housing. The protection is under the control of a time clock within the vault. A visual signaling device installed on the outside of the vault indicates condition of the alarm at all times. Means are provided for making sound tests after vault is closed.

Control equipment includes the A.D.T. sound accumulator adjustable as to number and intensity of shocks which eliminates unnecessary alarms due to momentary disturbances. An automatic cutout and reset silences the bell and restores system to normal after a period of ringing. Energized from dry cells or storage battery as desired.

Serviced from A. D. T. offices located at 117 points in the United States. Periodic inspections provided; prompt service may be obtained in event repairs or replacements are required.

Other Protection Systems for Banks

In addition to the Phonetalarm System described above, the American District Telegraph Company also furnishes laced systems for both Central Station and local operation. Systems are also supplied for protection against "hold-up."

DUPLEX ELECTRIC COMPANY

Bank Vault and Day-Raid Alarms, Vault Ventilators, Night Depository Protection

MAIN OFFICE AND FACTORY
71-73 Grand Street, NEW YORK, N. Y.
BRANCH OFFICES IN LEADING CITIES

Duplex Grade "A" Bank Vault Alarm Systems

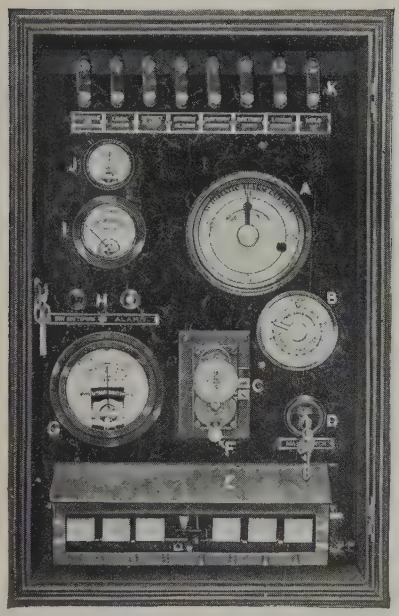
Tested and listed by the Underwriters' Laboratories, Inc., and rated Grade "A" giving 65% reduction in burglary insurance rates.

Duplex Grade "A" Microphone System—The entire vault structure and door are protected electrically by Duplex Microphone Units located on vault ceiling. Duplex Patented Sound Regulator controls the sound waves required to operate the alarm and prevents accidental alarms from extraneous sounds; alarm operates only from direct attack on vault structure or door.

The microphone element is discontinued automatically from service during daytime banking hours.

Vault Door—Is protected with bolt contacts and lined with Duplex patented thermostatic lining which operates to sound the alarm when door is attacked by torch or drill; the lining operates from mere conduction of heat through steel of door. This lining protects a greater continuous area of door than any other type of lining.

Public Alarm Station—Comprises two 18-in. diameter cast riot gongs (differently intoned to increase the violence of alarm) and mechanism. Completely enclosed in steel housing electrically protected at all points against every means of attack. No batteries located in alarm housing.



Control Panel in Vault

Control Cabinet—Installed inside the vault contains the following: 72-hour time-lock time controller, automatic cut-out, segregating circuit busbars, Yale-lock type main switch, testing ammeter, supervising milliammeter and relays, annunciator drops, constant ringing mechanism, automatic sound regulator.

Primary Batteries—Used for operating the closed circuits are located inside the vault.

Application—Installed for any type vault—whether already built or under construction.

Duplex Grade "A" Vault Cable System—Walls, ceiling and floor are electrically protected throughout by special lead covered cables laced at 3-in. centers in 18 separate circuits on the reinforcing rods before the concrete is poured. Cable System operates on a closed circuit through relay mechanism which gives the alarm the moment any circuit is severed. Vault door protection, public alarm station, control cabinet, etc., are identical to those in the Microphone System, excepting the microphone control features.

Application of Cable System—New vaults only, as cables must be installed on reinforcement during construction.

Duplex Grade "A" Night Depository Protection

Tested and listed by Underwriters' Laboratories, Inc. as Grade "A" reducing burglary rates on depository 65%.

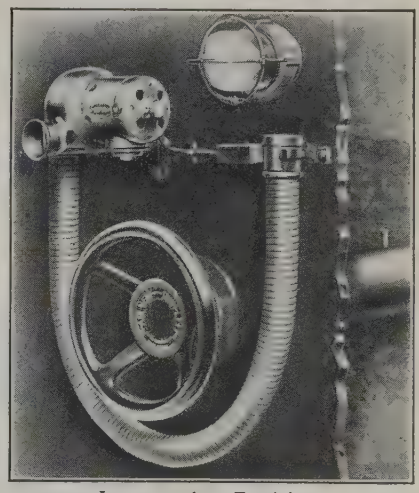
Walls and chute of Night Depository safe protected by lead covered cables at 3-in. centers installed prior to placing of concrete jacket. Safe door protected with Duplex thermostatic lining or closed circuit cables. Depository entrance completely protected. The depository protection is connected to the vault alarm system.

Application—Any Night Depository (After Hour) Safe, preferably when safe is being installed.

Duplex Vault Ventilator

Not only maintains basic insurance rates on vault, but adds to strength of wall. Provides a tested and approved means of preventing suffocation.

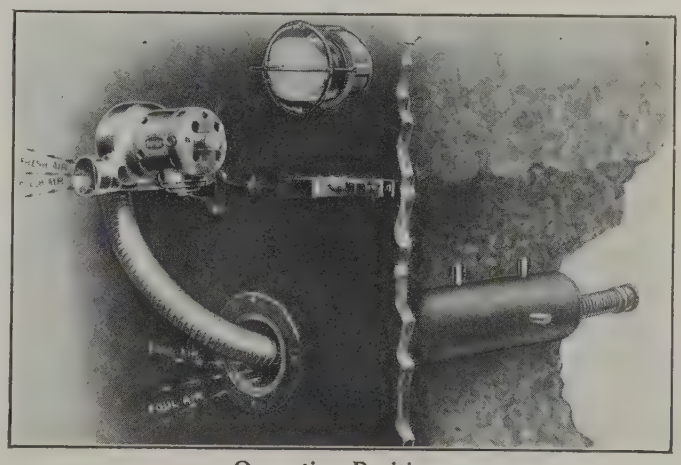
Comprises: (1) outer steel casing, (2) steel plug with pilot wheel, (3) fan motor unit with automatic control switch, (4) emergency light fixture.



Inoperative Position

Casing, which is 3¾ in. outside diameter, is embedded in concrete vault walls. Inner surface is tapered to form a liquid tight fit with the steel plug. Plug is held in locked position by heavy threads on hub of pilot wheel. Wheel is attached to plug by special joint which prevents successful outside attack or manipulation. Face of pilot wheel has radiant letters and is easily located in the dark. Flexible metallic air intake tube is permanently attached to fan. Automatic switch hook is attached to vault wall near pilot wheel and holds intake tube in inoperative position. Removal of tube starts fan and lights emergency light.

Operation—Simply remove plug by turning pilot wheel, take air intake tube from hook and thrust it through opening from which the plug has been removed.



Operative Position

Duplex Day-Raid System

Reduces robbery insurance rates 10%.

Provides patented foot-rails for tellers' cages. A contactor bar on the underside of the rail operates by movement of the toe upward and towards the operator. Box type rail prevents accidental alarms by insertion of mop or broom. Tell-tale type rail has a red annunciator which registers when rail is operated, thus showing exact source of alarm. Annunciator can be reset only by key in hands of cashier, thus checking any possible mischievousness. System operates an outside gong, silent alarm, or both.

FEDERAL GAS PROTECTIVE DEVICES for banks, stores, pay offices, etc.

FEDERAL GAS BURGLAR PROTECTIVE EQUIPMENT for safes and vaults.

Effective Safeguarding of Financial Institutions

Over 3500 Installations—Hundreds of banks and other financial institutions throughout the country have installed Federal Gas equipment in and about their buildings for the purpose of protecting the lives of their employees and the cash and securities entrusted to their safekeeping.

It is the newest and most modern form of protection against the hold-up man because of the fact that no physical injury to bystanders, employees or customers takes place. When an armed bandit enters the bank or store protected with Federal Gas Devices and orders the cashier or teller to put up his hands he has to approach the window of the cage or counter, as the case may be. The employee obeys orders and raises his hands, but his feet are active. One foot quietly presses a control unit for discharging the gas, filling the lobby in one-half second, and instantly the bandit is blinded and rendered helpless by the cloud of tear gas discharged in his face. This gives the employees of the bank a few moments time to act before the gas reaches them behind their cages, and the bandit will remain helpless for a considerable period of time, sufficient to summon help and disarm him.

Federal Gas in Operation in a Bank

Entire corridors of banks, fronts of cages, doorways, safes and vaults, wherever protection is necessary, Federal Gas guns can be concealed to protect the premises.

Bandits are helpless against these guns. This protection has never been beaten by the bandit. Guns are thoroughly concealed, if necessary, and are either automatically or mechanically operated from remote controls. It is the one form of protection which instantly becomes an offensive weapon, and before which a bandit or gang of bandits is rendered harmless and unable to shoot. It is a weapon which can be used without danger of injuring innocent persons; which does not depend upon the aim of the operator; and which is non-injurious, the effects lasting only about fifteen minutes. Insurance companies assume all liability without extra cost.

Federal Gas is the only protection that will break the coverage of a bandit with his gun without endangering the lives of bystanders.

For these reasons, Federal Gas stands paramount in the great business of combating crime.

Federal Gas

It is used in a solid form for stability and is instantly generated into a gaseous state which simultaneously supplies the pressure to project the gas from the guns. It is a harmless non-toxic gas, commonly known as tear gas. The guns are easily reloaded with new cartridges.

Federal Gas is approved by the Underwriters' Laboratories, Inc. and reduces holdup and burglary insurance rates where installed. Customers who have installed this protection attest to the fact they have no accidental discharges.

Installation and Equipment

Architects and financial and business executives interested in the installation of Federal Gas Equipment for the protection of their business should communicate directly with the FEDERAL LABORATORIES, INC. or the nearest agency for complete details of installation, type of equipment and other information.

It will not obligate you in the slightest degree to have our representatives call, set up and discharge equipment suitable for your needs and furnish you with all necessary information.

This equipment can be installed by local workmen or by experienced men supplied by us.

Products

Complete Electrical Bank Vault Local Burglar Alarms.

After Hour Depositories.

Vault Ventilators.

Electrical Tubular Chime and Clock Systems.

Organization and Scope of Operation

Over a quarter century of successful experience in electrical vault protection.

Paid up capital over $500,000.

Highest financial rating.

Experienced engineers and electrical experts.

More than 5000 systems in operation and under service throughout the United States and Canada.

Service

A large corps of field experts maintained and so located that any portion of the United States can be reached on a few hours notice.

Approved Grade "A" Burglar Alarm Systems

Discount—65% discount from burglary insurance rates upon vaults of any classifications.

Automatic Control—Exclusive patented features of automatic operation and control with visible and audible supervision and testing absolutely guarantee that the vaults will be properly closed, locked and electrically protected every night.

Burglar Alarm Housing

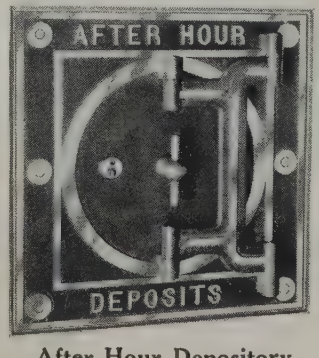
Daylight Holdup Alarm Stations—Both footrail and push button types for vaults, cages and other desired locations.

Inspection and Maintenance—Annual inspection by field experts provided for in contract.

After Hour Depositories

Enable banks to extend their deposit service to twenty-four hours every day without changing banking hours or adding to working force.

Special Features—Automatic return of deposit receiver; completes deposit automatically. Complete Grade "A" electrical protection to be connected to any make of Burglar Alarm System (optional). Electrical counting of deposits (optional). Sturdy construction. Best depository classification; lowest insurance rates; highest discounts. Name "After Hour" Registered U. S. Patent Office.



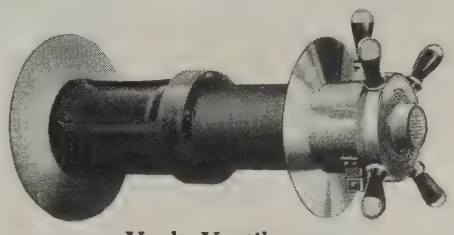
After Hour Depository

Vault Ventilator

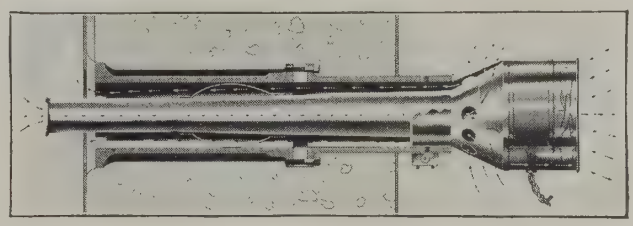
The vault ventilator safeguards the lives of persons locked within an airtight vault. Provides scientifically correct ventilation by forced draft—affording an abundance of air for all locked within the vault.

Draws in fresh air, expels foul air.

Embedded in the vault wall, it offers as much resistance against attack as the wall itself and is fireproof and liquidproof. It does not affect insurance rates.



Vault Ventilator



Sectional View of Vault Ventilator

Clock and Chime Systems

McClintock Clock and Chime systems are specified for use where accuracy and long life are desired—particularly outside clocks.

The systems include the master clock, secondary clocks, storage battery and charger.

Tubular chimes are a special feature of our clock system if desired.

Styles of outside clocks include bracket clocks with two, three and four dials, also pedestal style. Regular construction is steel frame covered by fabricated copper plates. Cast iron, wrought iron or bronze can be furnished.

Prominent Installation of McClintock Chime Clock

"Yeo Rotary"—Night Depository for Banks

The "Yeo Rotary" is a burglarproof *night depository* which allows a bank to offer a complete 24 hour deposit service 365 days per year to all their depositors, especially chain stores, garages, restaurants, storekeepers, building associations and all others who accumulate large sums after regular banking hours.

The "Yeo Rotary" is similar to the modern mail chute, used in office buildings, and consists of the same three general units: a receiving chest, a drop or entrance (rotary) and a steel connecting chute.

The "Yeo Rotary" has been approved and specified by leading architects and engineers and over 600 of these night depositories are now installed in the United States.

The "Yeo Rotary" Entrance, when open, projects no further from the building than when in the normal closed position. This is an important consideration when weather resistance is an objective.

Our patent, No. 1,576,125 covers rotary entrances and we are fully protected by the American Patent Protection Co. of New York. We are specializing in this field and have originated and patented the first burglarproof night depository entrance—the "Yeo Rotary."

"Yeo Rotary" Units—

(1) Yeo Patented Rotary Entrance.

(2) The steel connecting chute.

(3) The burglarproof receiving chest with circular door.

(4) The surrounding 6 in. of reinforced concrete poured around connecting chute and receiving chest.

(5) The deposit bags to be issued to prospective users, such bags being sealed by a special fastener and a padlock.

(6) All necessary form cards for bank records of such deposits.

(7) Necessary advertising data.

Insurance—"Yeo Rotaries" and their allied equipment receive the lowest insurance rating.

Electrical Protection—They can be attached to electric alarm systems already installed in the bank.

Data and Service—Our engineering service can give you the benefit of their experience and will assist you in the design of this equipment. Write for standard A. I. A. file giving full data.

Bank Vault Engineering Service for Architects

We maintain a staff of qualified vault designers and engineers. This staff will gladly assist you in the design and preparation of specification for vaults.

Full sets of plans and specifications should be furnished to the manufacturers in order to assure fair competitive bidding on vault equipment.

We have designed vaults from $10,000 up to $500,000 in cost. Our factory inspectors meet with all up-to-date methods of burglar-attack and we can design to resist them.

BANK and SAFE DEPOSIT VAULTS and VAULT FRONTS, including: Safe Deposit Boxes, Linings and Complete Equipment; FIRE-RESISTIVE VAULT DOORS, plate and filled; FIRE-RESISTIVE SAFES and FILING SAFES; STEEL MONEY CHESTS, rectangular and round doors.

Exclusive Features

Embodied in Diebold Vault Doors, Series 600 and 1000 are three exclusive Diebold features: (1) Diebold Daylight Automatic Lock, protection against daylight holdup; (2) Electric Alarm Grid *built into* the door, connects with any standard electric alarm system and is approved by manufacturers of leading electric alarms.

On all Diebold Bank Vault Doors 7 in. or greater in thickness the Diebold patented Thermatic Locking Device may be installed when requested. Approved by Underwriters' Laboratories and National Bureau of Casualty and Surety Underwriters, it entitles the bank to 10% preferential insurance discount.

65 Years of Successful Safe Building

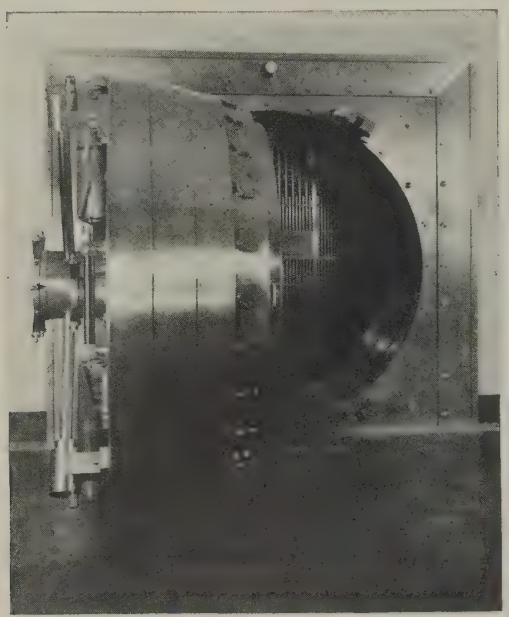
The recognized quality of the Diebold product is the result of experience as designers, engineers and manufacturers of bank vaults and safes since 1859.

During this period many Diebold safes and vaults have successfully withstood the severest tests, in actual service, as is attested by the many letters on file in this office.

Co-operative Service to Architects

Our Engineering Department, together with the entire personnel of our various branch offices is at the disposal of the architect or contractor.

Sketches and estimates on special work, as well as stock designs will be gladly furnished, without charge.



Bank and Safe Deposit Vaults and Doors

Complete Diebold bank vault outfits are in use in many of the largest banks throughout the United States.

These include all styles and sizes from the simplest to the most elaborate.

In this work all necessary equipment such as safe deposit boxes, linings, etc., can be furnished.

Catalog sent upon request.

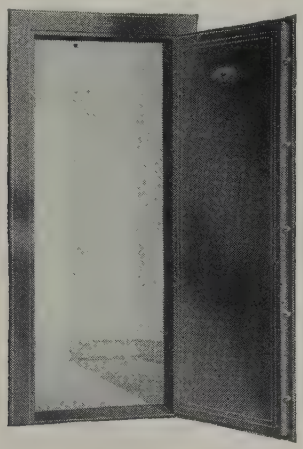
Bank Vault Door No. 507

Continued on next page

Victory Line Fire-resistive Vault Doors

The "Victory" Line includes a complete range of modern fire-resistive vault doors. Old style vault doors afforded approximately ten minutes resistance to intense heat unless thoroughly grouted and then only twenty-seven minutes, providing inside doors were closed. Grouting the old style plate door was not only impractical due to twisting it out of shape, but was seldom done because of the difficulty of installation and ease of misrepresentation. The Diebold "Victory" Line has been developed to overcome these evils and to give architects a line of Underwriters' labeled vault doors that need no grouting and that are so easy to install that there can be no object in slighting the installation.

During a severe fire, heat and flame are most likely to pass into the vault between the vestibule and the vault wall and between the door and jamb. The new Diebold "Victory" doors are designed to prevent this happening. Patented reinforced antiwarping channels are used so that buckling under the influence of heat cannot force an opening between the face of the wall and frame. An extra deep construction tongue on both sides and top jambs reinforced by the antiwarp channel and by "Z" bars that form the frame of the door, prevent warping between door and jamb. The lightest Diebold vault doors are fire-resistive for twenty-nine minutes with inside door open and from forty to forty-five minutes with inside door closed. The line ranges from these doors up to four-hour fire-resistive doors including Underwriters' labeled one-half hour and two-hour doors. In appearance they are handsome with their olive green finish, brush bronze trimming and black bakelite handles.



Vault Door Style "L," Underwriters' Label ½ Hour

Standard Fire-resistive Safes

Diebold fire-resistive safes embody several unusual structural features. The heat-resisting filler, besides furnishing perfect resistance to heat, possesses a high degree of inherent structural strength and thus provides a continuous, solid insulation between the walls of the safe.

It retains its fire-resisting qualities regardless of age.

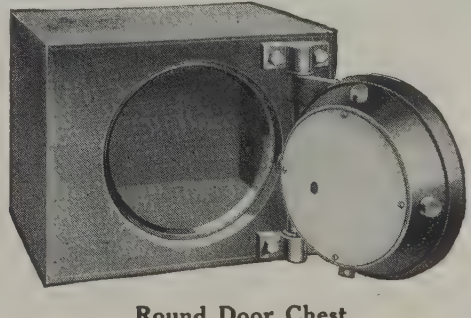
Heavy hinges provide easy operation of door and prevent sagging. Outside finish is olive green satin enamel, gold striped. Hinge tips, handle knobs and combination dial are buffed bronze with black bakelite handle grips.

Steel Money Chests

For bank use and for placing in standard fire-resistive safes and filing safes for protection of money, bonds, jewelry, etc., wherever burglary protection is required. Regularly made with rectangular and round doors in 5 sizes from 14x17⅞x15 in. to 24x24x24 in.

Constructed of alternate layers of open hearth steel plates, torch resisting plates and drillproof chrome steel plates. Ball bearing hinges and high grade bank combination locks. Finished in green enamel, striped in gold; combination dial black with white numbers; hinges and bolt work heavily nickeled.

Rectangular Door Chest



Round Door Chest

Products

FIREPROOF SAFES, Underwriters' Laboratories, Inc., Class "A" and Class "B" Label; BURGLARPROOF BANK and SAFE DEPOSIT VAULTS; FIREPROOF VAULT DOORS; VAULT EQUIPMENTS.

Also manufacturers of Filing Devices; Safe Deposit Boxes; Steel Lined Safe Deposit Safes for hotels and clubs; Silver Safes and Special Safes and Vaults for residences; Burglarproof Chests, Messenger Boxes, etc.

Fireproof Safes

The greatest possible structural strength is built into these safes. Angles and panel bars are of heavy steel and are fully welded together.

The insulation is of monolithic type and its engagement with the outer and inner walls of the safes is such as to consolidate strength and maximum heat resistivity. Perfect engagement of the doors with the safe structure is assured through pressed steel jambs with interlocking tongues and grooves supplemented with interlocking rear flanges. A patent strip seals the entire joint between the jamb and the rear flange of the doors. The doors are hung on ball bearing hinges. Heavy round steel locking bolts and their related connections are fully insulated from the face of the door. The combination lock is protected with a chrome steel drillproof plate. All safes are equipped with adjustable filing devices installed in accordance with specific requirements.

A selection of fifteen sizes is provided in the Class "A" safes and twelve sizes in the Class "B" safes, ranging from 38⅓ cu. ft. to 1¼ cu. ft. in capacity.

Standard finish is olive green.

Class A Fireproof Safe No. 4030

Outside, 58 in. high, 40½ in. wide, 30 in. deep. Inside, 40 in. high, 30½ in. wide, 19¼ in. deep

Fireproof Vault Fronts

Specifications—Sides and top No. 16, bottom ⅛-in. sheet steel. Front frame formed of 3⅞x$\frac{3}{16}$-in. open hearth steel bars, riveted at the bottom into 2½x¼-in. sill bars, fastened at the top by bar clips.

The rear frame is formed of 1¼x1¼x$\frac{3}{16}$-in. open hearth angles, securely fastened to the vestibule. Removable bars 4x$\frac{3}{16}$ in. are fastened on the back of the rear angles. These bars may be removed until the vestibule is set into the wall, after which they are to be replaced, thus holding the vestibule securely in position.

Outer door plate formed of $\frac{3}{16}$-in. open hearth steel, reinforced on sides, top and bottom by 2x¼-in. bars, making doors $\frac{7}{16}$ in. thick on edge.

No. 7830 Certified Fireproof Vault Door Bearing the Six-hour Label of the Underwriters' Laboratories, Inc.

Door is 5$\frac{1}{16}$ in. thick with pressed steel jambs, containing the fireproof insulation. Jambs are built with two flanges and one tenon and groove at top, front and bottom and have an interlocking flange with patented spring seal at rear. Clear opening through vestibule is 77 in. high by 30 in. wide. Shipping weight approximately 1650 lb.

MOSLER (PATENTED) INSULATED STEEL VAULT DOOR No. 3278—Underwriters' Labeled.

MOSLER (PATENTED) VAULT FRONT No. 51—Standard Fireproof Construction.

Also Fireproof and Burglarproof Safes, Chests, Bank Vaults, Safe Deposit Boxes, Book Vaults, Record Vaults, Silver and Fur Storage Vaults, Night Safes, Wall Safes; Safes and Vaults for hotels, clubs, jewelers, residence, oil and service stations, etc.

Mosler (Patented) Insulated Steel Vault Door No. 3278

Awarded Underwriters' Laboratories Six-hour Label for Fire Resistance.

This insulated vault door is constructed entirely of steel. Equipped with a thermostatically controlled insulated valve door which automatically seals the interior of vault against heat penetration. Maintaining a lower temperature inside the vault than the maximum allowed by the Underwriters' Laboratories, Inc. Also practically eliminates water from fire hose reaching the vault interior.

The monolithic fire-resisting insulation is of great structural strength. It will not produce gases under fire exposure that might result in explosion.

The hinges, boltwork and similar parts are of unusually rugged construction. The door swings back full 180° against vault wall. Made to swing right unless otherwise ordered.

Designed to fit masonry walls of any thickness exceeding 9 in., but, to afford protection equal to the door, the masonry should be 12 in. thick.

Specifications—The Contractor shall furnish and install a Mosler Insulated Steel Vault Door No. 3278 (Patented) for a .... in. .... wall. Masonry opening, 95¼ in. high by 45 in. wide (outside) and 79⅝ in. high by 35 in. wide (inside). Clear door opening 78 in. high by 32 in. wide, the over all of front including architrave 91¾ in. high by 50 in. wide.

Frame—Consisting of jambs, head and sill, shall be entirely of steel with interlocking tongue and grooves.

Door—Shall be 6¾ in. thick, entirely of steel with interlocking tongue and groove edges containing fire-resisting insulation. Main door shall be equipped with a supplementary insulated valve door, thermostatically controlled.

Underwriters' Label—The door and frame shall be complete in all respects and bear the Underwriters' Laboratories, Inc. label for six-hour fire resistance at high temperature.

Bolts—Door shall be equipped with seven 1-in. diam. locking bolts, three to the lock jamb, one each to head and sill, with interlocking tongue and groove and two bolts to the hinge jamb. Operated by lever handle covered with octagonal hard rubber grip.

Lock—Shall be a Mosler four-tumbler combination lock capable of 100,000,000 changes. Equipped with shouldered spindle, and protected by a hardened 5-ply steel plate and hardened steel guard plate.

Pressure Bar—Door shall be seated to surrounding frame by pressure bar device at front edge of door, operated by lever handle covered with octagonal hard rubber grip.

Foot Bridge—Provide a folding inclined non-slip steel foot bridge, to protect sill.

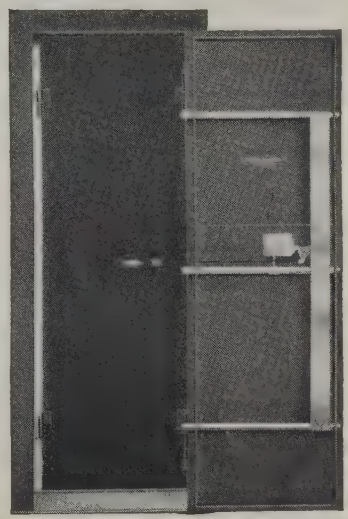
Finish—All exposed surfaces of door and frame shall be finished in Mosler standard olive green, ornamented with gold striping. Pressure bar device, metal surface of handles, lock and hinge tips shall be heavily nickelplated and rubbed to a satin finish.

Swing of Door—Door shall swing to the right [left].

Drawings and Instructions—Contractor shall obtain from the manufacturer necessary drawings and instructions for the proper installation of the vault door, and shall install the door and surrounding walls in strict accordance therewith.

Mosler (Patented) Vault Front No. 51

The type shown as No. 51 is made in various sizes and thicknesses. Especially constructed for book vaults, record vaults, storage and office buildings. Right or left swing.



Mosler No. 51 Vault Front

To fit finished masonry opening 77 in. high, 27½ in. wide, 13½ in. deep. Wall thicknesses can be increased or reduced, if desired

Specifications—The contractor shall furnish and install a Mosler No. 51 Vault Front for a wall opening, 77 in. high, 27½ in. wide and 13½ in. deep. Clear opening of this door, 74 in. high by 23½ in. wide. The outer door plate to be $\frac{3}{16}$ in. thick of open hearth steel, reinforced with $\frac{3}{16}$-in. angle bolt frames, making the door ⅜ in. thick on all edges and across center for lock protection. This door to have three single acting locking bolts 1 in. in diameter, operating across the door through the angle bolt frames mentioned above and controlled by a Mosler Combination Lock and Lever handle. The door to be equipped with an anti-dynamite device to protect the combination lock and bolts against explosives or external violence. The door swings to the right on pintle hinges.

The inner doors to be $\frac{1}{8}$ in. thick, of open hearth steel. The right-hand door to overlap the left-hand door and have flat bolt work at top and bottom and interlocking at the center, controlled by a patent key lock. Vestibule to have removable flange bars secured to the rear frame, so that this vault front can be placed in position after the walls are built and plastered. Outer door and inner doors to be finished in black and varnished—outer doors striped; inner vestibule finished in gray. Bolt work hinge tips, handles, trimmings, heavily nickelplated, rubbed to satin finish.

Engineering Service

Our branches will cheerfully furnish competent engineering service to aid you in preparing plans and specifications for burglarproof bank or safe deposit vaults. Write, or wire our factory collect, and our nearest representative will call on you.

Vaults are built in various sizes and thicknesses; to meet the particular requirements.

Schwab Insulated Vault Doors (Underwriters' 2-Hour Label)

Specified where *maximum fire protection is required.*

Schwab's 2-hour Vault Doors have a wide extra margin of safety—the equivalent to approximately a 3½-hour door. No greater protection will *ever* be needed. The strain on a vault door, where only one side is exposed to the fire and heat, is not nearly so great as on a safe where all four sides are exposed. And on an insulated safe, a 4-hour label is maximum.

Both the No. 2674B (single door) and the No. 3674B (double door) are of new type, with interlocking tongue and groove, insulated doors and joint.

It has been tested at the Underwriters' Laboratories, Inc., for:

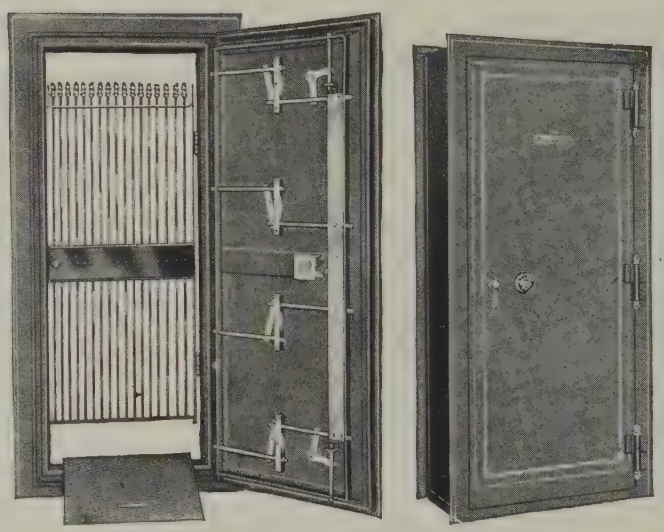
(1) Ease and practicability of installation.
(2) Fire endurance test.
(3) Fire and hose stream test.

The official Underwriters' report says:

"At the close of the test the papers were found to be in good condition with no traces of heat and no discoloration from smoke."

In every Schwab insulated vault door or safe, there is a substantial extra margin of safety.

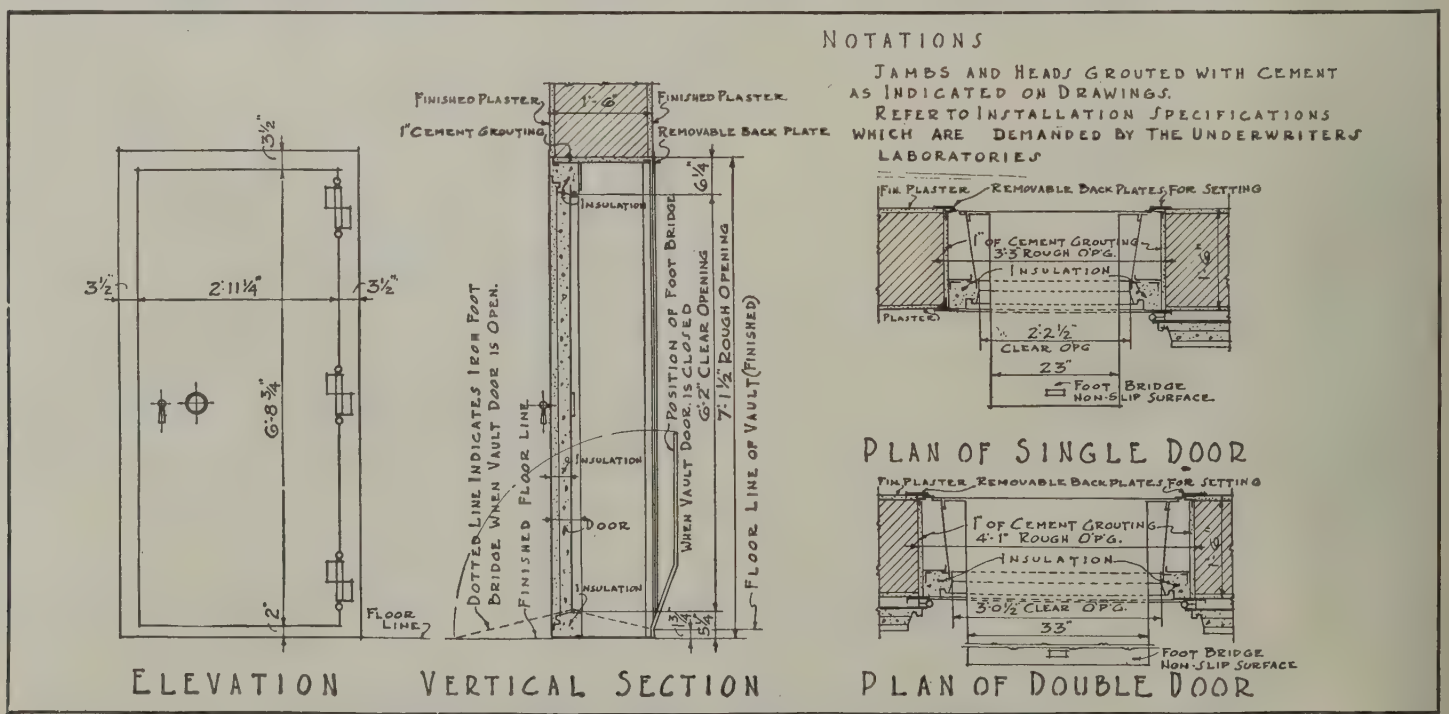
Send for our complete Architect's Portfolio, containing architects' specifications and details of vault doors, vault construction, underwriters' requirements, and contractors' and engineers' specifications.



No. 2674B, Schwab 2-Hour Vault Door

No. 3674B is the same with double door

Locking Mechanism—On inside of door are four double acting horizontal bolt bars ⅞-in. diameter cold rolled steel, operated by a cam working forward and backward and two ⅞-in. diameter bolt bars, one up and one down, all extending ¾ in. into jamb, checked by a 4-tumbler combination lock. Lock fastened to reinforcing strip on inside of door, engaging cam operated by handle on outside face of door.



Elevation, Section and Plan of Schwab Insulated Vault Door

Continued on next page

Foot Bridge—A ¼-in. thick safety tread steel plate foot bridge, hinged to turn inside when vault door is closed.

Day Gate—The day gate, complete with lock and alarm bell, as illustrated in the open view on this page, can be furnished at additional cost.

Hardware and Finish—Dark olive green lacquer, gold striped. All trimmings and bolt work heavily nickelplated.

Size—Vault doors bearing Underwriters' label can not exceed clear door opening size 38 in. in width, 78 in. in height, nor less than 10 in. in depth. The same fireproof construction can be furnished in larger size doors or in doors with narrower vestibule, but without Underwriters' label attached.

STOCK SIZES SCHWAB 2-HOUR VAULT DOORS

Door No.	Clear opening, in.	Wall opening, in.	App. shipping weight, lb.
Single door No. 2674-B....	26½x74x18	39x85½	1500
Double door No. 3674-B...	36½x74x18	49x85½	1800

Architect's Specification—No. 2674-B, or No. 3674-B—For the convenience of the architect the following specification to cover the New Type Insulated Door Vault is furnished:

The contractor shall furnish and install a No. 2674-B (or 3674-B) Schwab Insulated Fireproof [Single] [Double] Vault Door with interlocking tongue and groove, drawn steel frame and door flanges and jambs, as manufactured by The Schwab Safe Company, Lafayette, Ind. Outside door shall have four double acting horizontal bolt bars operating on a cam working forward and back and two vertical bolt bars, one operating up and one down, ⅞-in. in diameter, cold rolled steel, checked by 4-tumbler combination lock. The outer door shall be insulated with 3½ in. of insulating material tested by the Underwriters' Laboratories, Inc., and bearing the Underwriters' Laboratories 2-hour heat label. The frame and door jambs with interlocking tongue and groove shall be No. 16 U. S. gauge cold drawn steel and interlocked perfectly, one within the other. Vault shall be finished in dark olive green lacquer finish and striped. All trimming and bolt work shall be heavily nickelplated.

The masonry wall shall be * in. thick with opening for vault door [39] [49] in. wide and 85½ in. high.

Rear flange of vault frame shall be removable so that door can be installed after the building is completed.

Inside clearance of door shall be [26½] [36½] in. wide, 74 in. high.

Note: Masonry wall must not be less than 10 in. thick in order to obtain Underwriters' approval.

Note: Our complete Architect's Portfolio, containing specifications and details on vault doors, vault construction, Underwriters' requirements, contractors' and engineers' specifications, will be sent you on request.

Schwab Standard Fireproof Vault Doors

These vault doors do not bear the Underwriters' Label, but will meet the requirements of the majority of installations.

SPECIFICATION OF SCHWAB STANDARD FIREPROOF VAULT DOORS

Style	Clear opening through vestibule, in.		Rough wall opening, in.			Weight lbs.	Bolt work on outside door	Bolt frame, in.
	Wide	High	Wide	High	Deep

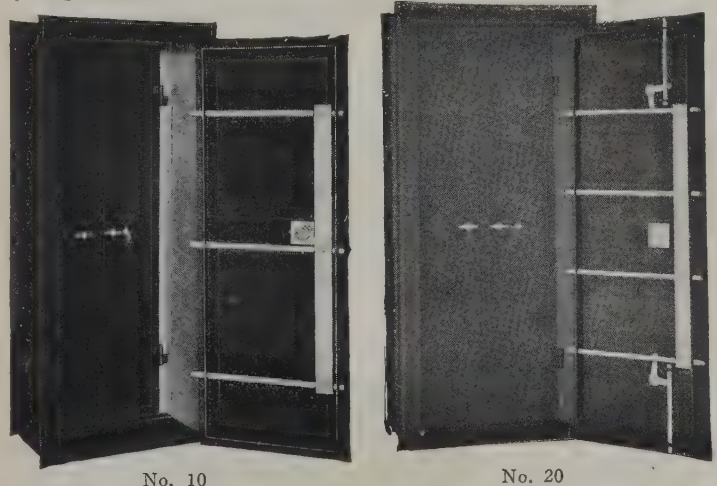
Carried in stock sizes, but can be made proper size to fit any wall opening.



No. 10 No. 20

Schwab Standard Fireproof Vault Doors

Installation Requirements, No. 10—For installation, the clear opening in the vault wall should be 77 in. high, 32 in. wide, and 18 in. deep. The vestibule can not be made less than 16 in. for our standard width vault for the inside doors to pocket in the vestibule.

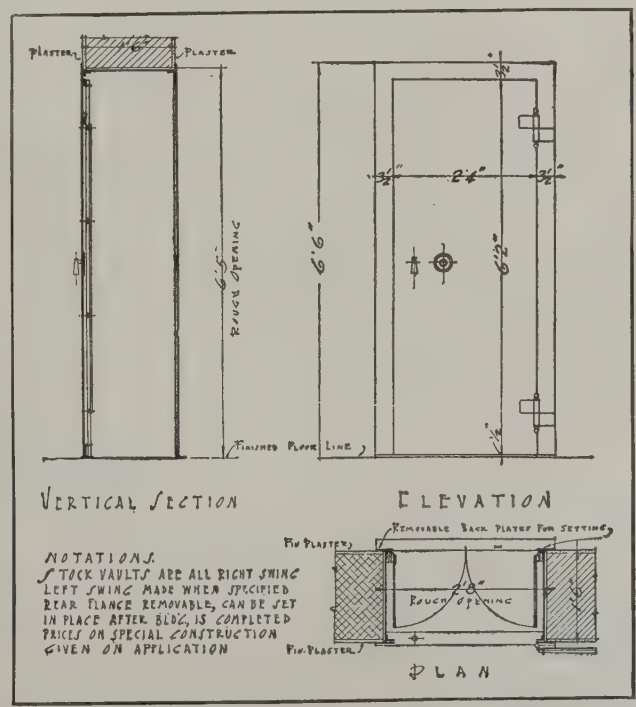
A vault 2 in. less in width will allow the inside doors to pocket in a 15-in. vestibule; 4 in. less in width will allow inside doors to pocket in a 14-in. vestibule, and so on.

Locking Mechanism—Outside door has three cross bolts 1-in. diameter cold rolled steel and checked by a 4-tumbler lock. Inside doors have one up and one down bolt checked by a heavy key lock.

Hardware and Finish—The handles, hinge tips, lock dials, cross bolt and carrying bars are polished and heavily nickelplated. Door handsomely finished in dark olive green with gold striping.

Installation Requirement No. 20—This style is similar in construction to the No. 10 vault door. Bolt work on this door, however, consists of four horizontal bolts, and one up and one down bolt 1-in. diameter of cold drawn steel.

Estimates—We can build any vault door to specification or duplicate any vault door specified in your plans, regardless of construction. Allow us to figure with you. It will be a pleasure.



Dimension Diagram, Schwab Vault Doors Nos. 10, 19, 20 and 21

No. 12—same except ordinarily used in narrow wall
No. 25—same except 42 in. wide and 21 in. thick

Continued on next page

Architects' Specifications, No. 10—The contractor shall furnish and install Schwab's No. 10 Fireproof Vault Door manufactured by The Schwab Safe Company, Lafayette, Ind. Outside door to have three cross bolts, 1-in. diameter cold rolled steel, checked by a 4-tumbler combination lock. Inside doors to have heavy flat bolts and key locks. Vault to be finished in dark olive green with gold striping. All trimmings and bolt work heavily nickelplated. The vault wall opening to be 77 in. high, 32 in. wide, 18 in. deep and must be built square, plumb and level; rear flange of vault frame to be removable so contractor can install vault door after building is completed and not mar the finish. Inside clearance of vault door, 74 in. high and 28 in. wide. Approximate weight, 580 lb.

Architects' Specifications, No. 20—The same as No. 10, with this change in bolt work: "Outside door to have four cross bolts, one up and one down bolt, 1-in. diameter cold rolled steel, checked by a 4-tumbler combination lock."

We can furnish special vault doors in either double or single door, with any desired number of bolts and any thickness of door plate up to ½ in. thick.

Can be made with either right or left-hand swing doors and proper size to fit any vault wall opening.

Schwab Safes and Burglarproof Chests

We will gladly furnish specifications or measurements upon request and assist beforehand on any built-in features contemplated in any of your plans.

Safes—Schwab builds perhaps the most complete line of safes of any manufacturer in this field. For maximum protection against fire Schwab builds the "A Label Safe" (4-hour Underwriters' Label); for a slightly lesser degree of protection, the "B Label Safe" (2-hour Underwriters' Label); and for ordinary protection the standard line of medium walled and heavy walled safes.

Insulated Filing Safes—For the protection of valuable records Schwab's Insulated Filing Safes give complete protection; complies with the Underwriters' requirements and carry their label for insulated cabinets. These safes can be equipped with any filing arrangement to fit the requirements of the purchaser.

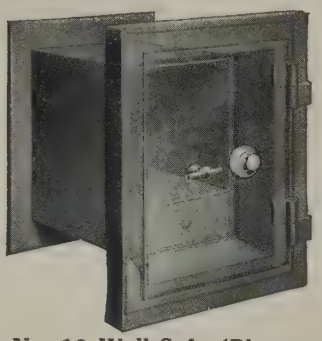
Fur Safes—In addition to building a very comprehensive line of standard single type and multiple type fur safes, we build fur safes to any specification.

Besides the added protection, fur safes beautify the modern display room, create an impressive atmosphere and effect a considerable saving in burglary insurance rates. We would be pleased to have you refer to any number of notable installations we have made. Confer with our engineering and designing staff.

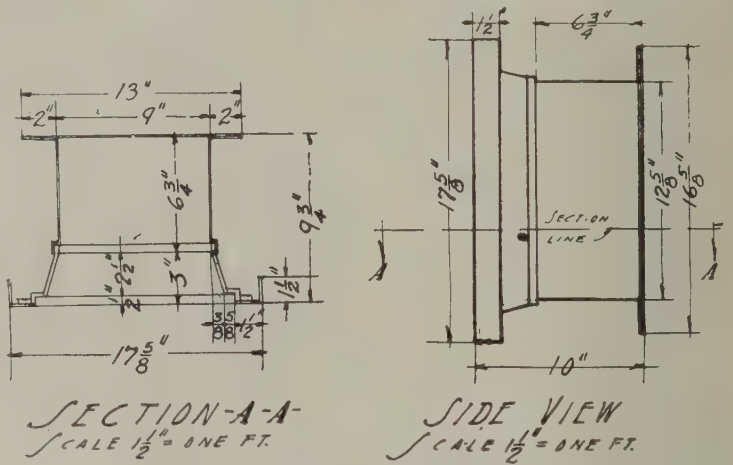
Jeweler's Safes—These safes afford maximum burglary protection combined with an attractiveness that will add beauty to any jewelry establishment. The inside may be arranged in any manner to suit the requirements of the jeweler. The standard safe, however, is ready equipped with cabinets, drawers, etc. We will be pleased to submit suggestions for the interior arrangements of these safes.

Burglarproof Chests—Filling stations, chain stores, theaters, etc., where considerable moneys or valuables are carried at all times, need, or rather are practically forced, to provide the protection of a burglarproof chest.

Schwab's Burglarproof Chests are built to install in the wall, anchor in a cement block or to place inside a regular safe. The line includes a circular door chest, a heavy steel chest and a lighter semisteel chest. Send for details.



Schwab No. 10 Wall Safe (Phantom View)



Detail of No. 10 Wall Safe

Wall Safes—This fireproof wall safe No. 10 is especially adapted for installation in homes, apartment houses, offices and hotels. Placed in the wall, it releases for other uses floor space otherwise occupied by a floor safe and, at the same time, affords greater secrecy together with protection and safety.

The interior of this wall safe is most conveniently arranged for utmost service and facility of use.

This safe is sturdily constructed throughout. The door is insulated 2½ in. thick. It has regular T-handle and combination lock, and tongue and grooved door and frame. There is a $\frac{3}{16}$-in. back plate to anchor in the wall and to prevent tampering from the back. The approximate weight of the safe is 75 lb.

Schwab's Architectural Service

Engineering Staff

We maintain a most competent staff of engineers to assist you with any problems within our scope.

Literature

Upon request we will gladly send you a copy of a recent set of specifications and details on vault doors and vault construction. This is prepared in letter file size and the entire series sent enclosed in a jute file folder with cross filing cards —A.I.A. 18 G. This series has been heartily endorsed by hundreds of architects.

We also would be pleased to send you data on fur safes, filing safes, wall safes, or our general catalogue.

The Company

The Schwab Safe Company has been building quality safes for more than 55 years. We have a very modern up-to-date plant with all modern manufacturing facilities.

Shipments

Shipments are made promptly, due to the large capacity of our plant and the excellent railroad connections.

YORK SAFE AND LOCK COMPANY

FACTORY AND HOME OFFICE

YORK, PA.

BRANCH OFFICES AND SALESROOMS IN PRINCIPAL CITIES

Products

BANK VAULT EQUIPMENT: Safe Deposit Boxes, Book and Storage Vault Doors, Burglary Chests and Safes.

York Insulated Vault Doors (Underwriters 4 hr. Label)

York Insulated Vault Doors are constructed with pressed steel jambs, forming a perfect tongue and groove around the door, and insulated in the same manner that has made the York safe noted for its fire resistance.

Mason's opening 91⅝ in. high and 46⅛ in. wide.
Clear inside opening 78 in. high and 32 in. wide.
Send for complete description.

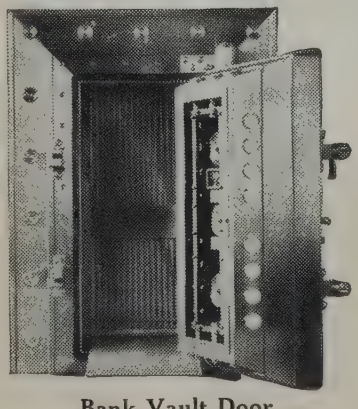
Safes

York manufactures a complete line of safes including Underwriters "A" label, standard fireproof safes, fur safes, etc.

Bank and Safe Deposit Vaults

We are designers and builders of bank and safe deposit vaults, large and small; safes, safe deposit boxes and other vault equipment. Established standard sizes and styles usually in stock for quick shipment. Especially constructed vaults in minimum time.

York bank vaults have been installed in many of the largest banks and financial institutions including the principal Federal Reserve Banks. Plans and specifications for any requirement will be submitted on request without charge or other obligation.



Bank Vault Door
15 in. thick

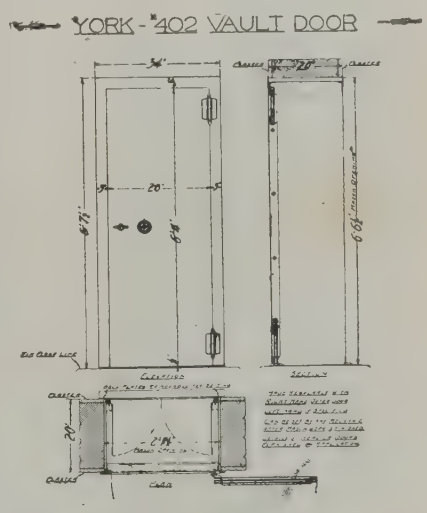
York No. 402 Vault Entrance

Standardized to fit opening 78½ in. high and 31½ in. wide for wall 20 in. thick. Can be furnished for walls of greater or lesser thickness when required.

No. 402 Vault Entrance

The illustration shows one of a type of York vault entrances which can be furnished in a variety of sizes and designs. The No. 402 has outer door $\frac{3}{16}$ in. thick equipped with four horizontal and two vertical locking bolts, checked by a high grade combination lock. The inside doors are $\frac{3}{16}$ in. thick and locked by a flat key lock. The back frame of the entrance is detachable, permitting the entrance to be set after the walls are finished. The entrance is handsomely finished in black with gold striping. Boltwork, handle and hinge tips are heavily nickelplated.

Illustrations and complete specifications of other sizes of entrances will be sent on request.



Round Door Burglary Chests

The York round door chest is built of an integral steel casting, case hardened by our special process. The door is a solid casting of the same material, treated in the same manner. This chest not only secures the lowest basic rate of burglary insurance, but the York Type "S" relocking device will entitle you to an additional 10% reduction.

Made in five sizes from 14 to 30 in. high; 14½ to 24 in. wide; 14¾ to 24 in. deep.

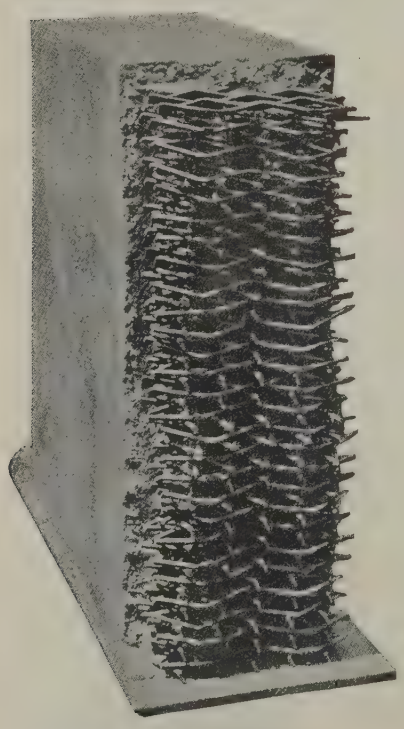
TRADE-MARK

Considerations in Planning for Adequate Bank Vault Protection

The fundamental considerations in designing or planning a vault, which will assure maximum protection under all conditions, are resistance to the burglarious and mob attacks and structural strength.

Sound judgment demands that these features be incorporated in the vault construction in a manner to produce a completely protected self-contained unit of safety.

Obviously, it is not enough that doors and locks alone be of superior quality. Wall, roof and floor structures must have equal strength and resistance.



Section of a "Steelcrete" Armor Mat

Placed either horizontally or vertically, Steelcrete forms a thick entanglement of steel. Concrete is poured through and around the steel mesh to form a wall that resists attack by drill, cutting flame and explosive

The best modern vault design will therefore comprehend using a form of construction which the most rigorous tests have shown to assure a degree of protection in wall, roof and floor equal to that afforded by the modern vault door—a continuous maze of steel locked in concrete.

Resistance to Attack

Since the purpose of any vault is to provide adequate protection by resisting the modern tools employed by cracksmen, every surface of the vault, whether exposed or not, should be constructed according to the highest standards to withstand and foil such attacks.

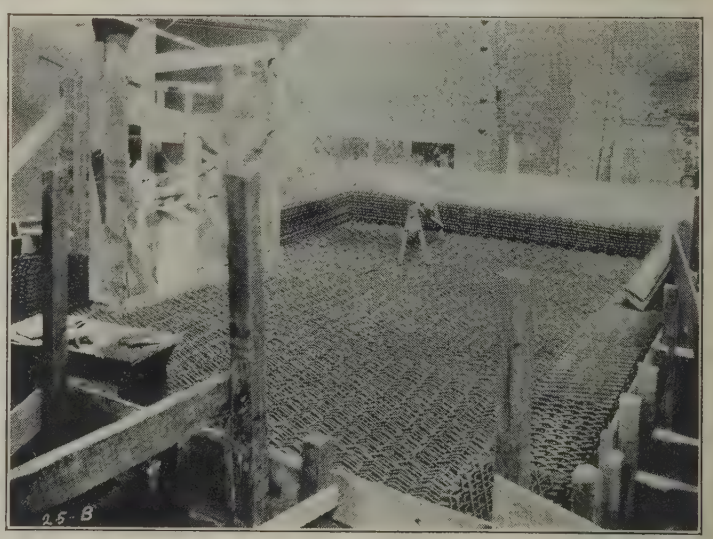
In the Steelcrete entanglement of steel and concrete, drills fail to secure a bearing, cutting torches are helpless against concrete, and high explosives lose their force in absorption by the thousands of steel members composing the mat embedded in concrete.

Extensive experiments under the authoritative supervision of engineers employed by the Federal Reserve Board have shown decisively that steel forming a matrix entanglement, combined correctly with concrete, constitutes the strongest and most economical bar to burglarious entrance.

Structural and Economic Advantages

Built up of steel units, extending layer after layer through the entire thickness of the concrete in the walls, floor or roof, Steelcrete Vaults are solid, self-contained units, constructed to stand secure against the terrific impact of falling girders, heavy office safes or such destructive forces as are caused by fire.

The costly addition of extra structural members is eliminated by the Steelcrete System, as a vault can be designed with ample load carrying capacity to support any load to which it may be subjected.



Horizontal System

Photograph taken when walls were just getting under way

Steelcrete Easily Erected by Any Skilled Contractor

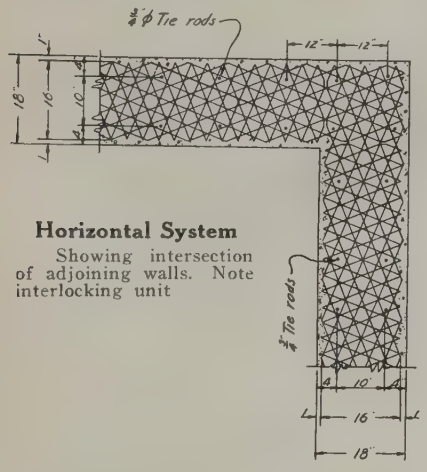
While the resistance, strength and economy of Steelcrete is unique in bank vault construction, installation is so easy and simple that it need be a matter of no concern whatever. The supervision of the architect to assure following of the specifications is all that is required, although the field engineers of the manufacturer keep in touch with the work and are held responsible by the manufacturer to guarantee the workmanship, if required.

Continued on next page

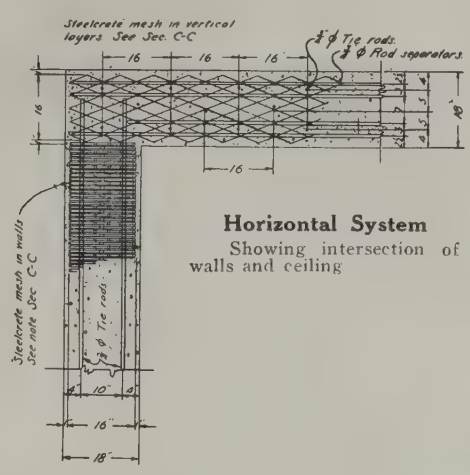
Horizontal System of Installation

The Horizontal system was developed for Federal Reserve Bank Vaults. The protection afforded per dollar invested was found to exceed that of any other horizontal design.

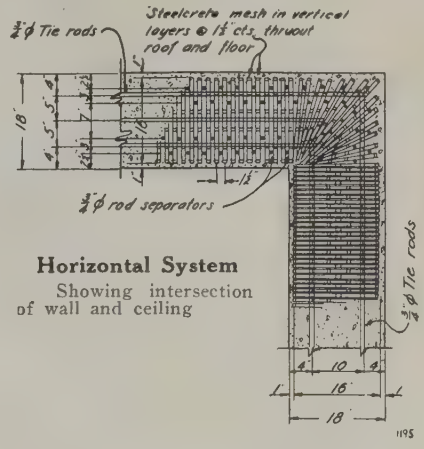
The Steelcrete units in the walls extend over to the outside surface of the adjoining walls and superimpose similar units. The corners are thus made rigid and firm.



Horizontal System
Showing intersection of adjoining walls. Note interlocking unit



Horizontal System
Showing intersection of walls and ceiling

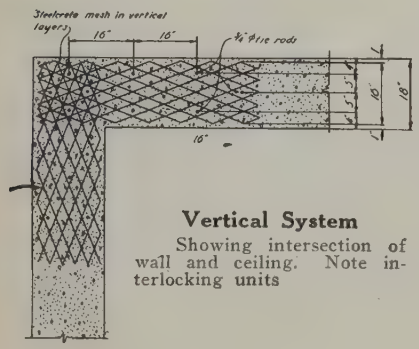


Horizontal System
Showing intersection of wall and ceiling

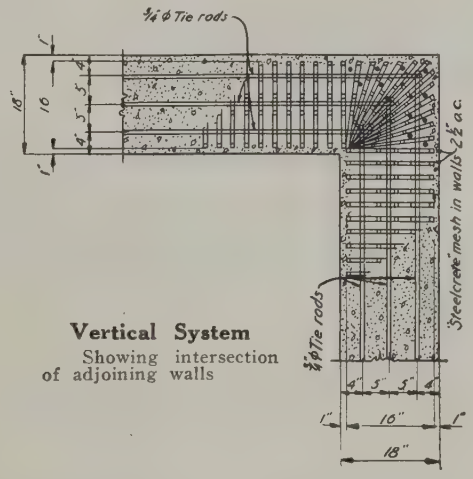
1195

Vertical System of Installation

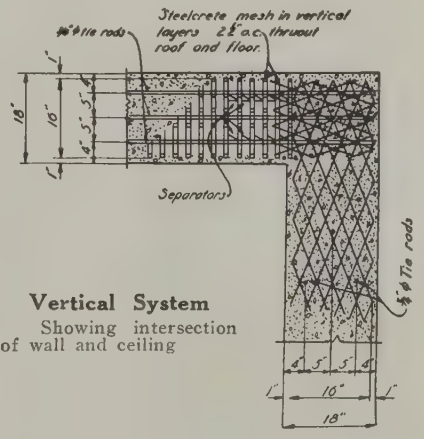
In order to suit all conditions of vault construction, the Vertical design is given. The same underlying principles of protection used in the Horizontal system have been applied here. The Steelcrete units in the walls interlock those in the roof and floor, creating a tie between the sections hardly to be exceeded.



Vertical System
Showing intersection of wall and ceiling. Note interlocking units



Vertical System
Showing intersection of adjoining walls



Vertical System
Showing intersection of wall and ceiling

Door Openings

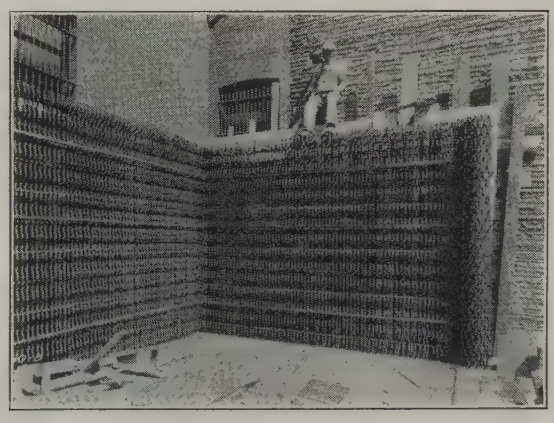
The door openings for both the horizontal and vertical systems are governed by the requirements of the manufacturer of the vault door.

Adaptable to Any Size Bank

The process materials, steel and concrete, which comprise the Steelcrete System are so flexible in themselves that there is practically no limitation to the adaptability of Steelcrete to satisfy any banking requirement or condition. Steelcrete vaults are to be found in twenty-three states and in many foreign countries. This acceptance is a tribute to the economy of the Steelcrete System as well as to its efficiency. Per dollar invested, you get more protection.

Steelcrete Service

We furnish field drawings, lump sum estimates and by arrangement will supervise the installation of the Steelcrete units. Blue print drawings showing typical details for all listed drawings in both horizontal or vertical mat construction will be furnished on request. Book mailed on request.



Wall Showing the Vertical System
In this method of construction the wall, floor and roof have the same arrangement of Steelcrete

Products

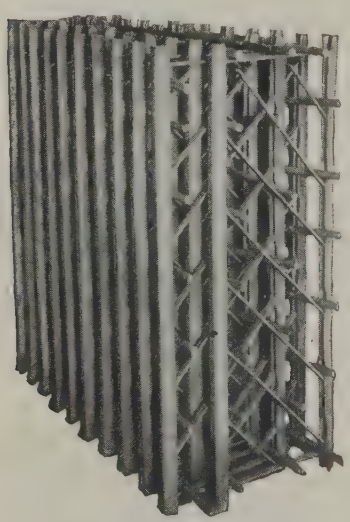
Rivet-Grip Bank Vault Reinforcement.

For Rivet-Grip Steel Joists, see page A671.

Also manufacturers of Rivet-Grip Rigid, Shop-fabricated Truss Bridge Roadway Reinforcement (description on request).

Rivet-Grip Vaults

The high regard which bank architects and engineers have for Rivet-Grip vaults and the prestige which the system has attained are evidenced by the fact that the Rivet-Grip System has been installed in nearly twice as many Federal Reserve vaults as any other type of vault reinforcement offered on the market since the Federal Reserve vault tests. It is significant, that in every instance where Rivet-Grip was purchased by a Federal Reserve Bank, either an official of the bank, its architect, or vault engineer represented the bank at the Federal Reserve tests, and the sale of Rivet-Grip was due to recommendations carried back by eye witnesses, after seeing the efficient performance of Rivet-Grip in these severe tests.



Rivet-Grip Reinforcement—Vertical Type

As a result of the Sandy Hook tests, Rivet-Grip System was adopted for nine Federal Reserve bank buildings, including the banks of Cleveland, St. Louis, Minneapolis and San Francisco, and the Federal Reserve branches at Cincinnati, Louisville, Pittsburgh, Little Rock and Salt Lake City. The Rivet-Grip System has also been used in several hundred National and State banks. (See brief list on following page.)

Balanced Protection for Bank Vaults

The first requisite for security in a bank vault is *balanced protection*—equal protective strength throughout. In other words, the walls, floor and roof should be no less secure than the vault door. In the Rivet-Grip System, this balanced protection is obtained through a new system of steel reinforcement, which is fabricated in various sizes to give the walls and slabs a protective value equivalent to that of any particular door from 4 to 48 in. in thickness.

Why Rivet-Grip Insures Balanced Protection

To penetrate a vault wall reinforced with Rivet-Grip steel frames requires a long period of time, a great variety of equipment and frequent changes in the attacking operations.

Drills must be used to penetrate the concrete, explosives are required to break up the concrete, chipping tools are necessary to separate the concrete from the steel, and torches must be used to cut the heavy Rivet-Grip sections. Moreover, the disposition of steel in a Rivet-Grip wall is such that all these operations must be repeated many times through the thickness of the wall.

There are no weak points in a Rivet-Grip protected vault. The frames interlock at all corners. The door connections are as strong as the vault door itself. The scientific design of Rivet-Grip reinforcement insures balanced protection throughout.

Design

The Rivet-Grip System consists of an interlocking network of heavy shop-fabricated frames and plain round bars, embedded and interlocked through practically the full thickness of the concrete work.

The Rivet-Grip frames are composed of two parallel, heavy Rivet-Grip main sections, joined at close intervals by lighter diagonals, which form the web of the frames. The joint, or Rivet-Grip, is formed under a 30-ton pressure which forces the metal in the main sections around the knobs on the diagonals, joining these members so securely that the diagonals will break in tension before loosening at the Rivet-Grip.

The loose bars are laced through the frames perpendicular to the plane of the web members. They are held in position automatically and need not be wired.

All Rivet-Grip reinforcement is accurately fabricated and comes to the job true to detail. There are two types of installations: *vertical,* for use in walls from 12 to 30 in. thick, and *horizontal type,* for use in walls from 27 to 60 in. in thickness.

Structural and Economic Advantages

In addition to its protective value, many structural and economic advantages help to explain the wide choice of Rivet-Grip System.

Lowest Insurance Ratings—Rivet-Grip walls and slabs receive the lowest insurance ratings.

Flexibility of Arrangement—The spacing and general arrangement of the frames may be varied to give the exact degree of protection desired.

Structural Strength—Rivet-Grip frames form an efficient structural reinforcing, and allow vault walls and slabs to be designed for carrying heavy building columns, or with clear spans up to 40 ft.

Ease of Installation—All material is completely shop-fabricated and ready to place before shipment. To unload the reinforcement from trucks and place it in its proper position in the vault requires only five to eight man-hours per ton.

Lower Cost—The Rivet-Grip System of vault reinforcement costs less than any other adequate and effective system and the ease with which it is installed materially lowers construction cost.

Designing and Estimating Service

The drawings on the following page will prove useful as a guide for selecting the proper type of Rivet-Grip reinforcement to use with any particular vault door. However, if the types shown do not fit your problem, our Engineering Department will gladly make a study and submit a layout and we will recommend the most economical solution of your problem without incurring any obligation on your part, if plans or dimension sketches of the vault are submitted to us. Whenever available, thickness of doors and linings should also be given.

Lump sum estimates, either for material only or including erection for any vault, gladly furnished to architects upon request.

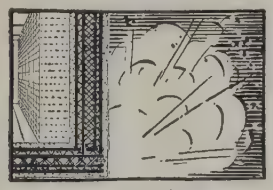
Continued on next page

Torch Resisting

The special Rivet-Grip channel sections are hard to burn as concrete adheres firmly to the steel within the channel

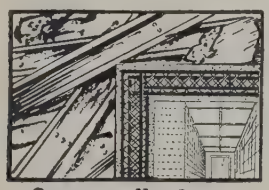
Tool Resisting

Rivet-Grip Reinforcement is not only torch resisting but tool resisting. Its multiplicity of heavy members cannot be pierced with cold cutting tools and drills as is possible with lighter members and fabrics



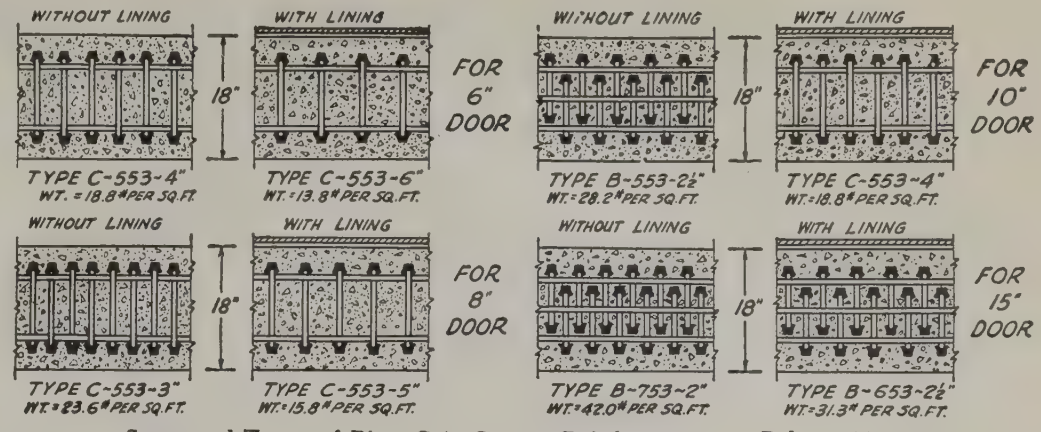
Resists Explosives

The large proportion of heavy steel members and the rigid attachment of ties or stirrups to main bars at close intervals, keeps Rivet-Grip units intact even after severe detonations

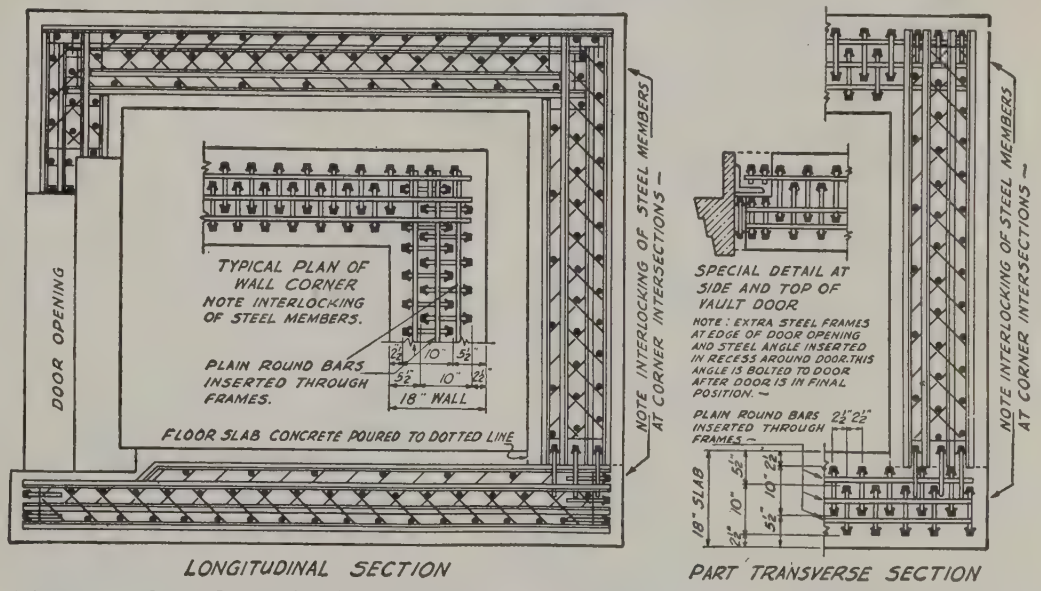


Structurally Strong

Rivet-Grip Bank Vault Reinforcement is not only impregnable to burglarious or riotous attack, but is strong enough structurally to resist breaking or crushing due to a collapse of the building from fire or other causes



Suggested Types of Rivet-Grip System Reinforcement to Balance Various Thicknesses of Vault Doors



Diagrams Above Show the General Method of Detailing Rivet-Grip Reinforcement When the Most Popular Type, Namely Type B-553—2½-in. Spacing of Units—Is Used

Vaults with 18-in. concrete walls and slabs with this type of reinforcement get the best, or No. 10 insurance rating without the use of steel lining in the vaults. Complete typical details and specifications for types of Rivet-Grip other than those illustrated will be furnished upon request

Specifications

Reinforcement—The reinforcement shall be the "Rivet-Grip System bank vault reinforcement" as produced by THE RIVET-GRIP STEEL CO., Cleveland, Ohio.

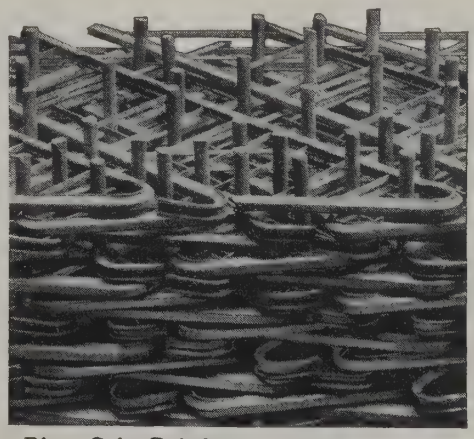
The arrangement of Rivet-Grip frames and plain round bars shall conform to that shown on page A1341 of SWEET'S ARCHITECTURAL CATALOGUE, Twenty-third Edition, for Type ..... spacing of frames. The reinforcement shall be detailed for walls ..... in., floor slab ..... in., and roof slab ..... in. thick.

All units shall interlock at all intersections of walls, and of walls and slabs, and special provision shall be made for door openings to strengthen connections between door frames and vestibules and reinforced concrete walls.

All units shall be completely shop-fabricated and shipped ready to place. They shall be tagged with an erection mark corresponding to the marks on the drawings furnished by the manufacturer.

Note: This specification applies only to the vertical type. Specifications covering our horizontal type are especially written for each individual vault.

Drawings—THE RIVET-GRIP STEEL CO. shall furnish complete placing drawings showing the exact location of each frame and spacer bar. Two sets of prints of approved placing plans and details shall be furnished for use in placing steel.



Rivet-Grip Reinforcement—Horizontal Type

Concrete—Shall be proportioned of 1 part portland cement, 2 parts clean, silaceous sand, and 3½ parts ¾-in. gravel or ¾-in. crushed stone.

THE MACOMBER STEEL COMPANY

Massillon Vault Reinforcing

901 Belden Avenue, CANTON, OHIO

For Massillon Steel Building Products, see pages A658-659; for Massillon Joists, see pages A672-673

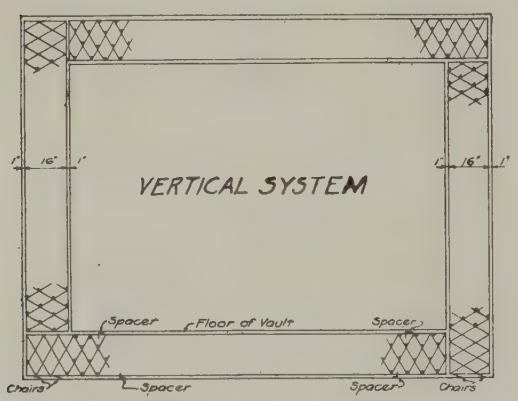
Product

Standard and special systems of vault reinforcing for banks, jewelry stores, isolated plants, financial institutions, etc. The systems are based on the use of standardized reinforcing frames, spacers, chairs and tie bars. The frames are built in standard widths from round steel bars with electric arc welding. The use of round bars results in a maximum of reinforcing with a free flow of concrete to properly encase all members. The frames and spacers insure every ounce of steel being placed exactly as intended.

The National Bureau of Surety and Casualty Underwriters grants Massillon Systems the preferential ratings indicated below. Massillon Vault Reinforcing Systems are fully protected by U. S. Patent No. 1669988.

Standard Systems

Vertical Systems—Six common types of Massillon Vertical Systems are illustrated below. The first figure indicates the wall thickness, "V" indicates vertical type, the last figure indicates spacing of frames. The plane of the frames is at right angles to the wall surface in both systems. In the vertical systems the wall frames stand on their ends on chairs. Spacing bars on the inside and outside of the walls space and maintain the frames in their proper position. Tie bars thread horizontally through the frames.



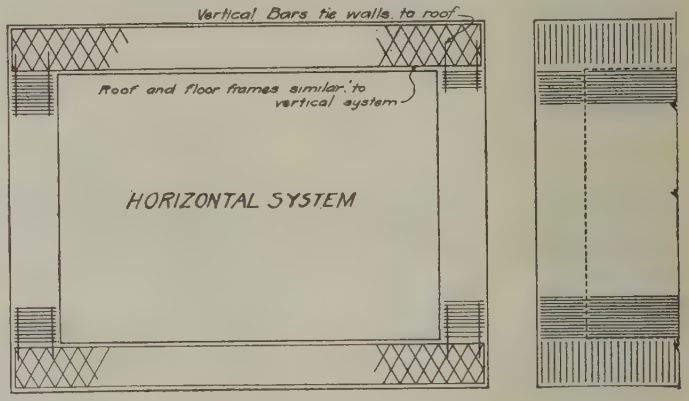
VERTICAL CROSS SECTION

ELEVATION

The placing of floor and ceiling frames is identical for both the horizontal and vertical systems. Chairs and spacers hold the frames in place. Tie bars thread horizontally through the frames and special tie bars thoroughly reinforce all corners.

Horizontal Systems—Four common types of horizontal systems are shown below. The wall frames are stacked one upon the other and separated with spacers on 2-in. centers. The tie bars are threaded vertically through the frames. The horizontal systems permit the effective placing of the maximum amount of reinforcing for any given wall thickness.

Special Systems—Smaller vaults of the type used in chain stores and filling stations and the largest vaults of the Federal Reserve Bank Type call for special treatment. Massillon engineering service is available to architects and vault engineers in drafting up recommendations for special types of vaults.

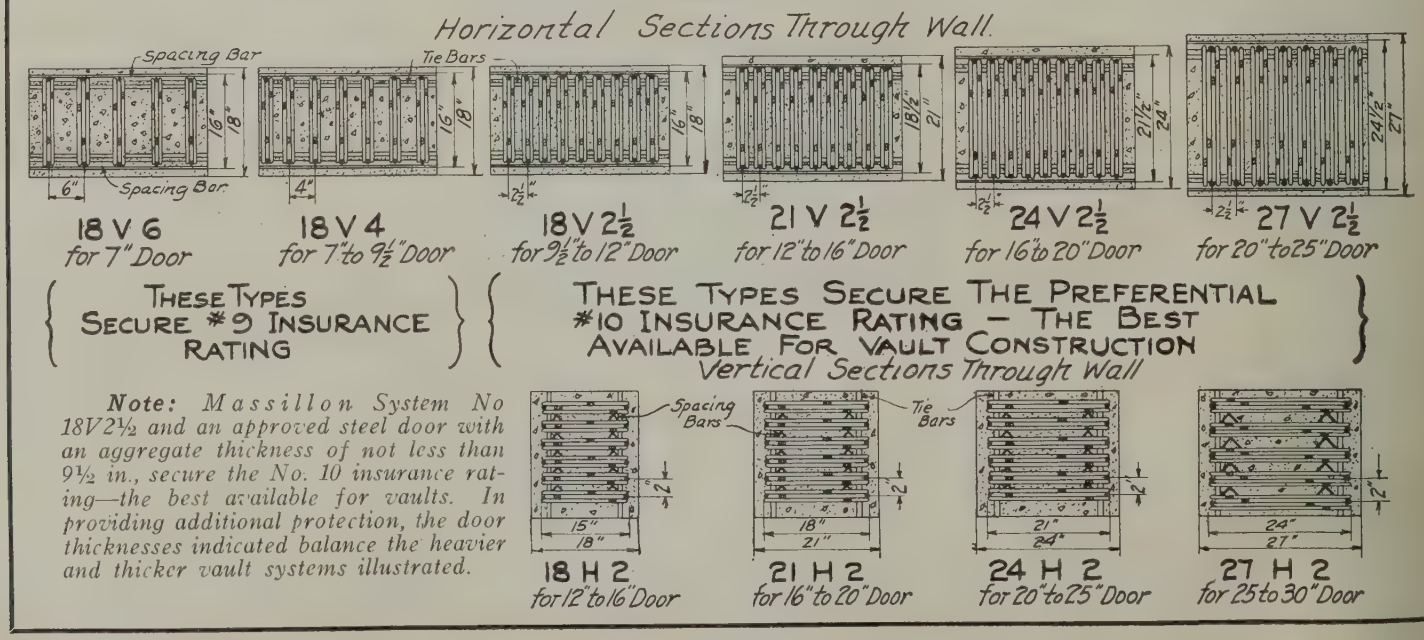


Scope of Service

Realizing the tax on an architect's time, no general sales calls are made except on request. A.I.A. catalogue containing detailed designing data and complete specifications will be mailed on request. Massillon Engineering Representatives are available in practically all building centers to co-operate with architects in preparing definite recommendations and estimates to meet their requirements.

Specifications

The vault construction shall consist of Massillon type number, ..., Vault Reinforcing manufactured by the MACOMBER STEEL COMPANY, Canton, Ohio, completely encased in concrete mixed in the proportion of one part Portland Cement to one and one-half parts sand to three parts clean washed broken stone or gravel not over ¾ in. in size. The reinforcing shall include all necessary frames, chairs, spacing bars and tie bars properly identified with symbol numbers and placed in accordance with erection plans to be furnished by the manufacturer. The arrangement and details shall conform to the requirements of the National Bureau of Casualty and Surety Underwriters to secure their No. ..... insurance rating.



Note: *Massillon System No 18V2½ and an approved steel door with an aggregate thickness of not less than 9½ in., secure the No. 10 insurance rating—the best available for vaults. In providing additional protection, the door thicknesses indicated balance the heavier and thicker vault systems illustrated.*

WESTERN WIRE & IRON WORKS, INC.

Manufacturers of Bankers Approved Locks and Wire Mesh Bank Cages

TELEPHONE
CANAL 6442, 6443

1820-1830 South Sangamon Street
CHICAGO, ILL.

Products

SLIDING DOOR LOCKS and HANGERS for Bank Cages.

WIRE MESH BANK CAGES.

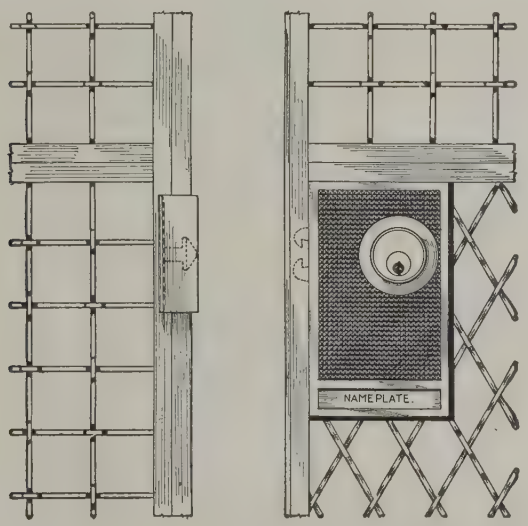
GRILLES and WICKETS for Bank Cage Fronts.

For Steel and Bronze Folding Gates and Wire Mesh Products, see page A819.

Bankers Approved Lock

The Bankers Approved Lock has been developed to provide a sliding door lock for bank cages that is *positive locking*. By referring to Fig. 1 you will notice that double jaws eliminate all possibility of lifting or working the door loose from the engaging tongue in the keeper without first disengaging the jaws with key or knob.

The jaws recessed in door frame, and the channel construction of the keeper make it impossible to open the door by picking the lock with any thin instrument.



Patented Apr. 24, 1928

Fig. 1

Another feature that overcomes a serious objection to the projecting latch type of lock is that there are *no projections* in the door opening when door is open. This helps to prevent torn clothing.

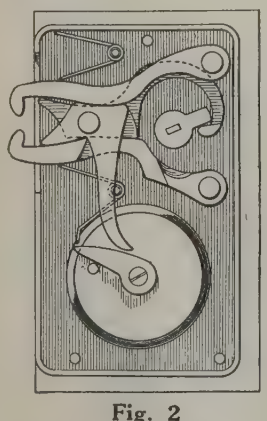


Fig. 2

Knob in rear of lock is recessed flush with back plate.

Fig. 2 shows lock with face plate and cylinder removed. Lock is made of *bronze throughout* insuring long life of parts and faithful performance. Exterior of lock is finished natural bronze.

Note: Brass springs hold jaws in closed position at all times when door is closed.

Figs. 1 and 2 both show right-hand lock. Specify Lock 106B right or left hand.

Spee-d Ball Bearing Hangers

The Spee-d Ball Bearing Hangers, while designed primarily to be used with the Bankers Approved Lock on sliding doors for bank cages, can also be used on any 1-in. wood or steel door using a 2x¼-in. flat track.

Fig. 3 shows front elevation and cross section.

Face plates have pyramidal hatched surface to match locks and are made in malleable iron or bronze. Malleable plates are painted prime coat flat black. Bronze plates are finished in natural bronze. Made in short size Nos. 110M and 110B, and in long size Nos. 111M and 111B. Gravity sliding doors require one of each size; manual sliding doors two No. 110.

Ball bearing sheave is made entirely of case hardened steel, with extra deep groove to hold the track, and contains 14 ¼-in. ground balls. All sheaves are machined and tested for alignment. Hub of sheave bolts tight against case by means of ⅜-in. machine bolt tapped through case.

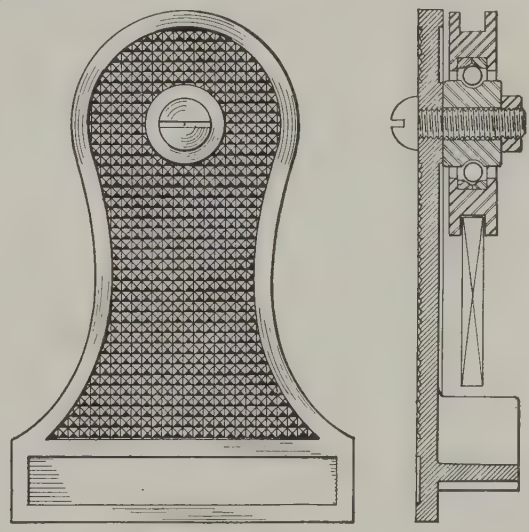

Fig. 3

Hangers are made to fit a 24-in. standard width door. If doors are wider than 24 in. or thicker than 1 in. state the width and thickness when ordering.

This is, as far as we know, the only hanger on the market made to harmonize with the lock.

Specifications for Locks and Hangers

Provide all sliding doors with Bankers Approved Lock No. 106B as manufactured by the WESTERN WIRE & IRON WORKS, INC., Chicago, Ill. Lock to be natural bronze finish and to be equipped with (name make of cylinder). Hinged door locks to match sliding door locks.

Provide Spee-d Ball Bearing Hangers Nos. 110B and 111B as manufactured by the WESTERN WIRE & IRON WORKS, INC., Chicago, Ill., with face plates to match locks. All doors to be gravity (or manual) sliding. Finish natural bronze. (For malleable iron specify Nos. 110M and 111M.)

Wire Mesh Bank Cages and Grilles and Wickets for Bank Cage Fronts

We are equipped to manufacture all types of bank cages in round, flat or square wire, and upon request will furnish new and up-to-date designs for wire mesh bank screens and dividing partitions for bank cages, either in double crimp or press crimp.

JOHN H. BUEKERS, JR.

Manufacturer and Contractor of Bulletproof Equipment

2117-21 Elmwood Avenue, DETROIT, MICH.

Products

"Platt" Bulletproof Equipment for banks, stores, offices.

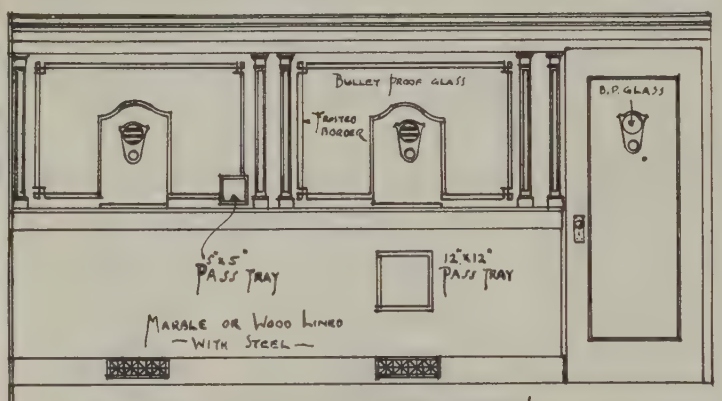
Also manufacturer of and contractor for Special Woodwork and Fine Cabinet Work, Bank Fixtures and Partitions, Ornamental and Hand Wrought Iron Work.

Bulletproof Equipment

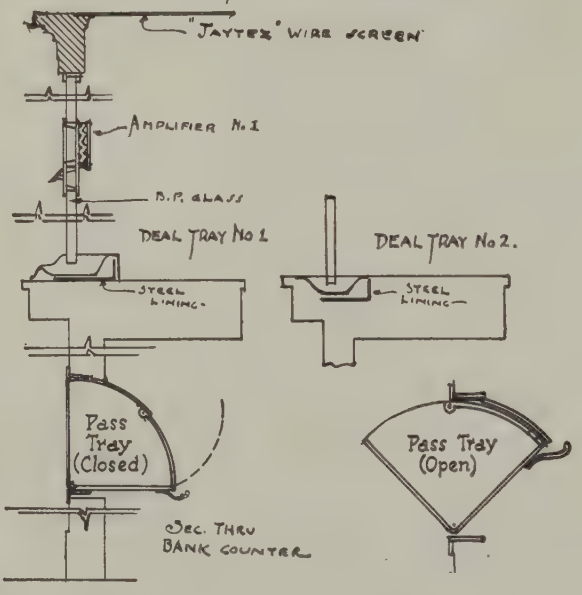
Consists of deal trays, pass trays, glass, speaking apertures, gun ports, steel wire screen. This equipment may be combined with any style of fixture, wood, marble or metal. Can be installed as individual units or we will contract for both the bulletproof equipment and the fixtures.

We will also estimate on remodeling fixtures now in use, making them bulletproof.

Note: Set of full size blue prints of our Bullet Proof Equipment sent to architects on request.



BULLET AND BANDIT PROOF BANK SCREEN



Section of Typical Installation

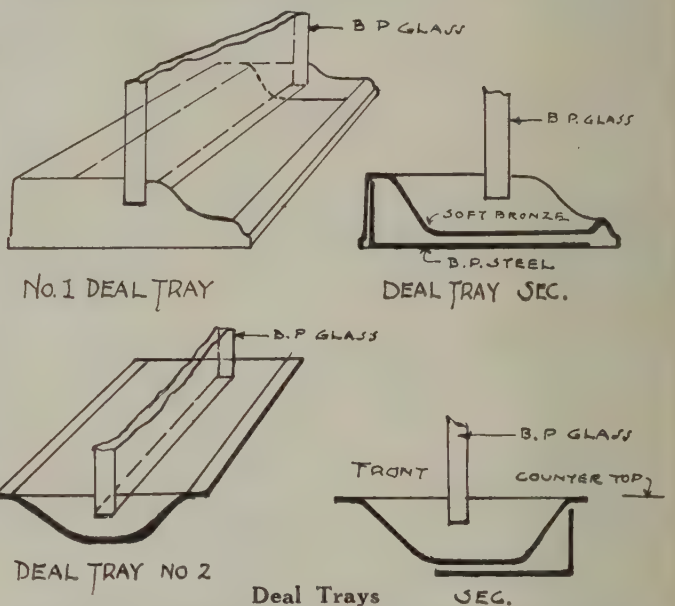
The above cross-section of a typical bulletproof installation shows how Bulletproof equipment provides the maximum protection against bandits. Neither by shooting through the woodwork, the glass, the grilles or by clambering up to shoot down through the roof of the cage can a bullet reach the occupant.

Roof of enclosure is covered with "Jay-tex" Wire Screen. Upper part of enclosure may also be partly of "Jay-Tex" screen and bulletproof glass, or all bulletproof glass (as illustrated). Bulletprooof glass can be furnished in any size required, in thicknesses of ⅞, 1⅛ and 1⅜ in.

Amplifier No. 1 (with gun port feature combined) or No. 2 (amplifier only) may be supplied. Also deal tray No. 1 or No. 2 (see description above at right).

Bottom front of enclosure can be faced with any material, marble, wood, etc., but wood enclosure is always lined with bulletproof steel.

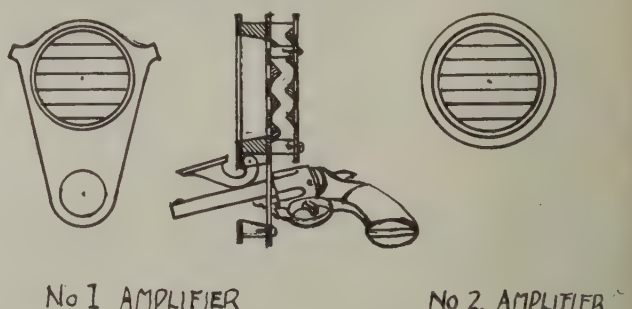
It is always desirable to specify bulletproof pass tray for receiving and disbursing bags of coin and small packages for every bank fixture fronting on the banking room.



Deal Trays

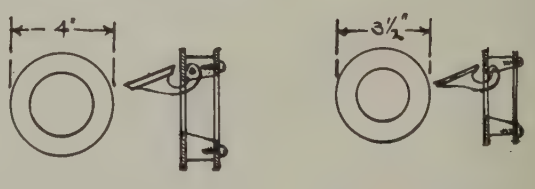
The deal trays shown above are practically the same construction but different design and it is only personal preference which dictates the selection. Trays are designed to permit interchange of funds between patron and bank employee with convenience. At the same time positive protection against hold-up is afforded the employees.

Trays are made of soft bronze and lined with bulletproof steel. Bullets fired into the tray cannot ricochet—they simply pierce the bronze and flatten against the steel lining.



No 1 AMPLIFIER

No 2 AMPLIFIER



No. 1 GUN PORT

No. 2 GUN PORT

Amplifiers and Gun Ports

Amplifiers—Made of bullet resisting Metal and arranged with louvres staggered to deflect a bullet so that it will drop harmless on the outside. Perfect audition is a feature of this amplifier.

Type No. 1 combines the features of amplifier and gun port. Type No. 2 is amplifier only.

Gun Ports—Can be opened only from inside. Permit occupant of cage to fire in all directions without risk to himself. Can be installed in the glass, in the wire or in the steel enclosure of the cage.

INDESTRUCTO GLASS CORPORATION

Manufacturers of Bulletproof and Scatterproof Glass

421 Seventh Avenue, NEW YORK, N. Y.

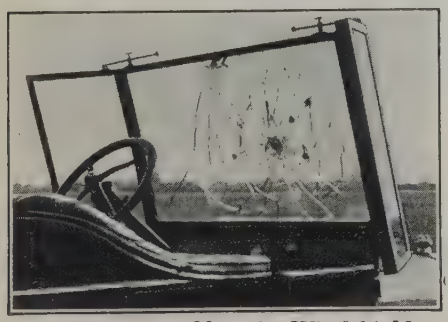
FACTORY: FARMINGDALE, LONG ISLAND, N. Y.

Indestructo Bullet Resistant Glass

Designed to provide great strength and resistance to penetration, especially of bullets from firearms. It is a clear vision, laminated product, made of alternate layers of plate glass and a flexible, transparent binding material, firmly united in one solid sheet under a patented process, which not only provides bullet resistance *but also insures against separation, discoloration or reduced transparency.*

The degree of resistance of laminated glass is in direct ratio to the strength of the bond uniting the glass with the transparent, flexible material. The Indestructo bond is accomplished without gelatins or other adhesives which frequently dry out or suffer natural chemical reaction causing loosening of the bond, total separation or objectionable yellow discoloration rendering the glass unfit for the uses primarily intended.

Revolver Resistant Glass—This standard material can not be penetrated by any revolver, regardless of caliber or ammunition. The windshield in the accompanying photograph withstood 11 shots from a .38 caliber long barrel police special revolver in a small area and a final shot from a .45 automatic in the center of the already weakened area. There was no penetration, no displacement of glass from the back and no dangerous mass action.



Indestructo Glass in Windshield
Twelve shots without penetration

Special Bulletproof Glass—Which will resist penetration from any weapon, may be produced by varying the combination of thicknesses and number of layers. Data on heavy side arm and shot gun resistant glass is given in table below. In most cases the standard revolver resistant material provides adequate protection at minimum cost.

Indestructo Scatterproof Glass

Developed primarily for protection against injury from flying glass in windows of buildings or vehicles. It is made in two grades.

Sizes

The binding material used is procurable in sheets 21x50 in. only so that this size should be considered in laying out a bank counter or other structure to be made banditproof. Larger lights can be procured by splicing the binding material which, however, results in a fine hair line being visible in the finished light at the point of splice. Splicing can be in one direction only for a given piece. Due to other conditions the maximum sizes obtainable by splicing are 34x50 in. or 21x56 in.

THICKNESS AND WEIGHTS OF INDESTRUCTO GLASS

Description	Thickness, in.	Tolerance, in.	Wt., lb. per sq. ft.		Number glass layers
			Net	Crated	
Bullet Resistant:					
Revolver	1	1/16	11	15 to 16	3
Heavy side arms	1 1/16 to 1 1/4	1/16	13	18	3
Shot gun	1 1/8 to 1 3/8	3/32	14 to 16	17 to 20	4
Scatterproof:					
Grade A	3/16 to 5/8	.....	3 to 6	4 to 8	2
Grade B	1/8 to 1/4	.....	2 to 4	3 to 6	2

Public National Bank, New York, N. Y.
Eugene Schoen, Architect
Bronze speak fixtures and sunken deal trays

Installation and Fixtures

Indestructo bullet resistant glass requires no special methods of setting or framework, other than that the frame should be large and strong enough to receive and carry the heavier and thicker glass. Aside from this, standard practices in setting glass apply.

There are various types of fixtures for passing of money and for communication between teller and customer, any of which are well adapted for use with this glass. One type has bronze speak fixtures and sunken deal trays while another has sunken deal tray with an offset wicket giving a space of 1 in. around the glass for passage of the voice thus eliminating the use of speak fixtures.

Indestructo glass can not be cut to size after manufacture, so it is necessary that exact sizes be furnished with orders if shapes are rectangular or circular. If irregular shapes are required templates or patterns should be furnished. This glass can be drilled, ground, polished and otherwise worked the same as ordinary glass, but this work must be done by the manufacturer. It also can be etched, chipped or sandblasted to produce ornamental surface patterns.

Peninsular State Bank, Detroit, Mich.
V. Pottle, Architect
Offset wicket with 1-in. space on sides for voice passage and sunken deal trays

Guarantee

Indestructo glass is furnished under a guarantee against deterioration unfitting it for use due to faulty manufacture.

BULLET-PROOF GLASS

MANUFACTURED BY
SAFETEE GLASS COMPANY
Broad Street and Poplar
PHILADELPHIA, PA.

Product

SAFETEE BULLET-PROOF GLASS for Bank Enclosures and other places subject to the sudden attacks of robbers.

Safetee Glass
WON'T SHATTER OR FLY
TRADE-MARK

Holdup Men Get $28,000

A familiar enough headline and one that statistics show will be repeated with variations, within the next and succeeding hours.

To prevent this enormous loss of property, new and more efficient methods of protection are necessary—methods that will eliminate the factor chiefly responsible for the success of most holdups—intimidation.

This requires that the employee be placed beyond reach of the bandit's bullet. Safetee Bullet-proof Glass does just this, while at the same time it interferes in no way with the employee's ordinary duties.

Four Shots Shown on Glass
Test Pistols of the Highest Calibre Have Proved Ineffective in Penetrating Safetee Glass

Illustration is from a photograph, unretouched, showing the effect of test guns with high calibre bullets fired at close range. None of them went through the glass

Advantages of Safetee Bullet-proof Glass

When used in bank partitions, tellers' windows, etc., separating the public space from the working space, Safetee Bullet-proof Glass provides absolute protection to moneys, securities, etc., and to personnel, in the event of an attempted holdup.

Safetee Bullet-proof Glass will stop a .45 calibre metal jacketed pistol bullet fired at close range from an automatic pistol. This has been well proven in numerous tests.

A sample of this glass, size 12x20 in. stopped three of these bullets at 3 ft. distance. This sample is still intact notwithstanding the fact that test was made five years ago. The integrity of Safetee Glass is not impaired when cracked.

Bandits depend largely upon intimidation to help them in making a "haul." When an employee stands behind Safetee Bullet-proof Glass he is out of harm's way and therefore can not be intimidated. If he can not be intimidated, the holdup can not be successful.

Banks and cars protected by Safetee Bullet-proof Glass are left alone by bandits—they pick easier prey.

For all practical purposes Safetee Glass is as fully transparent as the best quality polished plate glass. It is not wire inserted.

And no less important than the practical advantages above listed is the fact that Safetee Glass does not detract in the slightest from the artistic effect demanded in bank fixtures.

Construction Features

Safetee Bullet-proof Glass is made up of 5 layers of material, consisting of 3 pieces of polished plate glass and 2 binding layers, the whole welded together under high temperature and tremendous pressure.

The resulting product is a perfectly solid sheet of glass possessing great strength and resiliency.

When struck a sharp, heavy blow the cushioning effect, resulting from the laminated construction, prevents the glass from shattering and the missile from penetrating.

As shown in tests and in actual use strong impacts cause a multiple of hairlike cracks, but no breaks or splinters.

Sizes

Safetee Bullet-proof Glass can be furnished in sizes up to 34x58 in. The thickness is 1 in. Allowance should be made for a variation of $\frac{1}{16}$ in. plus or minus in thickness.

Service

We will be glad to co-operate with the architect in furnishing suggestive designs for any desired installation, together with detailed drawings and estimates.
